The doctrine of election had led to a separation between Whitefield and the Wesleys in 1741. Wesley believed that the grace of God could transform every life that received it. He preached the doctrine of conscious acceptance with God and daily growth in holiness. Victory over sin was the goal which he set before all his people. He made his appeal to the conscience in the clearest language, with the most cogent argument, and with all the weight of personal conviction. Hearers like John Nelson felt as though every word was aimed at themselves. No preacher of the century had this mastery over his audience. His doctrine may be described as Evangelical Arminianism and its standards are his own four volumes of sermons and his Notes on the New Testament.

Up till 1742 Wesley's work was chiefly confined to London and Bristol, with the adjacent towns and villages or the places which lay between them. On his way to Newcastle that year Wesley visited Birrast, where John Nelson, the stone-mason, had already been working. On his return he held memorable services in the churchyard at Epworth. Methodism this year spread out from Birrast into the West Riding. Societies were also formed in Somerset, Wills, Gloucestershire, Leicester, Warwickshire, Nottinghamshire and the south of Yorkshire. In the summer Charles Wesley visited Wednesday, Leeds and Newcastle. Next year he took Cornwall by storm. The work in London was prospering. In 1743 Wesley secured a west-end centre at West Street, Seven Dials, which for fifty years had a wonderful history. In August 1747 Wesley paid his first visit to Ireland, where he had such success that he gave more than six years of his life to the country and crossed the Irish Channel forty-two times. Ireland has its own conference presided over by a delegate from the British conference. Wesley's first visit is said to have been on October 21. He paid twenty-two visits, which stirred up all the Scottish churches.

Such extension of his field would have been impossible had not Wesley been helped by a heroic band of preachers. Wesley says: "Joseph Hutton was the first lay preacher that assisted me in England, in the year 1738." That was probably help in the Fetter Lane Society, for Wesley then had no preaching place of his own. John Cennick, the hymn-writer and schoolmaster at Kingswood, began to preach there in 1739. Thomas Maxwell, who was left to meet and pray with the members at the Foundery during the absence of the Wesleys, began to preach. Wesley hurried to London to check this irregularity, but his mother urged him to hear Maxwell.
for himself, and he soon saw that such assistance was of the highest value. The autobiographies of these early Methodist preachers are among the classics of the Evangelical Revival. As the work advanced Wesley held a conference with his associates in 1744. Besides himself, and his brother, four other clergymen were present and four "lay brethren." It was agreed that "lay assistants" were allowable, but only in cases of necessity. This necessity grew more urgent every year. At last, in 1745, an organization was made for the purpose. The body was the "assistant," who had general oversight of the work, the others were "helpers." The conference became an annual gathering of Wesley's preachers. In the early conversations doctrine took the foremost place, but as his methods of preaching and its growing organization occupied more time and more attention.

In February 1784 Wesley's deed of declaration gave the conference a legal constitution. Wesley became president of the organization and the project was made more permanent. The executive was thus fortified. Every year we meet once a year, fill up vacancies in their number, appoint a president and secretary, station the preachers, admit proper persons into the ministry, and take general oversight of the societies. In October 1769 a Methodist chapel was opened in New York. At the conference of 1769 two preachers, Richard Boardman and Joseph Plumer, volunteered to go out to take charge of the work. In 1771, Francis Asbury, the Wesley of America, crossed the Atlantic. Methodism grew rapidly, and it became essential to provide for its people with the sacraments. In September 1784 Wesley ordained his clerical helper, Dr Coke, superintendent (or bishop), and instructed him to ordain Asbury as his assistant and prevent the growth of the church from being led astray. Wesley and Thomas Vasey were ordained by Wesley, Coke and Crockett to administer the sacraments in America. Wesley had reached the conclusion in 1746 that bishops and presbyters were essentially of one order (see Methodism, sect. "United States")

He told his brother in 1785: "I firmly believe that I am a scriptural υπερασπιστής as much as any man in England or in Europe; for the uninterrupted succession I know to be a fable, which no man ever did or can prove." Other orders for the administration of the sacraments in Scotland, the colonies and England followed. The interests of his work stood first with Wesley. He did everything that strong words against separation could do to bind his societies to the Church of England; he also did everything that legal documents and ordinances could do to secure the permanence of that great work for which God had raised him up. In the words of Canon Overton and Rev. F. H. Relton (Hist. of Eng. Ch. 1714-1800): "It is purely a modern notion that the Wesleyan movement ever was, or ever was intended to be, except by Wesley, a church movement." Despite his strong sayings, it was Wesley who broke the links to the church, for, as Lord Mansfield put it, "ordination is separation." Wesley's account of his itinerancy is given in his famous Journal, of which the first part appeared about 1730. Mr Birrell has called it "the most amazing record of human exertion ever penned by man." It is certainly Wesley's most picturesque biography and the most vivid account of the evangelical revival that we possess. The rapid development of his work made a tremendous strain upon Wesley's powers. He generally travelled about 5000 m. a year and preached fifteen sermons a week. He had constant encounters with the mob, but his tact and courage never failed. His rule was always to look a mob in the face. Many dreadful stories are told of his presence of mind and the skilful appeals which he made to the better feeling of the crowd.

Wesley's writings did much to open the eyes of candid men to his motives and his methods. Besides the incomparable Journal, his Apologies to Men of Reason and Religion also produced an extraordinary effect in allaying prejudice and winning respect. He constantly sought to educate his own people. No man in the 18th century did so much to create a taste for good living and to grow up in the way he had found. Sir Leslie Stephen pays high praise to Wesley's writings, which went "straight to the mark without one superfluous flourish." As a social reformer Wesley was far in advance of his time. He provided work for the deserving poor, supplied them with clothes and food in seasons of special distress. The profits on his cheap books enabled him to give away as much as £1400 a year. He established a lending stock to help struggling business men and did much to relieve debtors who had been thrown into prison. He opened dispensaries in London and Bristol and was keenly interested in medicine.

Wesley's supreme gift was his genius for organization. He was by no means ignorant of this. "I know this is the peculiar talent which God has given me." Wesley's special power lay in his quickness to avail himself of circumstances and of the suggestions made by those about him. The class-meeting, the love-feast, the watch-night, the covenant service, leaders, stewards, lay preachers, all were the fruit of this readiness to avail himself of suggestions made by men or events. Wesley skilfully wove these into his system, and kept the whole machinery moving harmoniously. He inspired his preachers and his people with his own spirit and made everything subordinate to his overarching purpose, the spread of scriptural holiness throughout the land.

In 1751 Wesley married Mary Vazeille, a widow, but the union was unfortunate and she finally left him. John Fletcher, the vicar of Madeley, to whom Wesley had turned as a possible successor, died in 1785. He had gone to Wesley's help at West Street after his ordination at Whitehall in 1757 and had been one of his chief allies ever since. He was beloved by all the preachers, and his Checks to Antinomianism show that he was a courteous controversialist. Charles Wesley died three years after Fletcher. John Wesley died on 25th April 1791, after a life of usefulness and labor. He had reaped the harvest he had sown. Honours were lavished upon him. His people hailed every appearance among them with delight, and his visits to various parts of the country were public holidays. His interest in everything about him continued unabated. He had a wealth of happy stories which made him the most delightful of companions in the homes of his people. Robert Southey never forgot how Wesley kissed his little sister and put his hand on her head and blessed him. Alexander Knox says, "So fine an old man I never saw! The happiness of his mind bemedled forth in his countenance. Every look showed how fully he enjoyed "The gay remembrance of a life well spent." Wherever Wesley went, he diffused a portion of his own felicity." He preached his last sermon in Mr. Belson's house at Leatherhead on Wednesday, the 23rd of February 1791; wrote next day his last letter to Welburn, urging him to carry on his crusade against the slave trade; and died in his house at City Road on the 2nd of March 1791, in his eighty-eighth year. He was buried on the 9th of March in the graveyard behind City Road chapel. His long life enabled him to perfect the organization of Methodism and to inspire his preachers and people with his own ideals, while he had conquered opposition by unwavering patience and by close adherence to the principles which he sought to teach.

See also Methodism, and the articles on the separate Methodist bodies; see also Wesley Family (J. T.)

WESLEY, SAMUEL (1766-1837), English musical composer, son of Charles Wesley (see above), was born at Bristol on the 24th of November 1766, and developed so precociously a talent for music that at three years old he played the organ and at eight composed an oratorio entitled Ruth—a fact which is duly chronicled on a curious portrait, painted in 1774, and afterwards engraved, wherein he is represented in the childlike costume of the period. Though suffering for many years from an accidental injury to the brain, Wesley was long regarded as the most brilliant organist and the most accomplished extempore fugue-player in England. He may indeed be regarded as the father of modern organ-playing, for he it was who, aided by his friends Benjamin Jacob and C. F. Horn, first introduced the works of Sebastian Bach to English organists, not only by his superb playing, but by editing with Horn, in 1810, the first copy of Das wohltemperirte Clavier ever printed in England. Wesley's last performance took place on the 12th of September 1837 at Christ Church, Newgate Street, London, where, after hearing the wonderful performances of Mendelssohn, he was himself induced to play an extempore fugue. He died on the 11th of October 1837, leaving a vast number of MS. and printed compositions.

His brother Charles (1757-1815) was also an accomplished organist, and still more famous was his son, Samuel Sebastian (q.v.).

WESLEY, SAMUEL SEBASTIAN (1810-1876), English composer and organist, natural son of Samuel Wesley, the eminent composer, was born in London on the 14th of August 1810.
was one of the Children of the Chapel Royal from 1819, held various unimportant posts as organist from the age of fifteen, and in 1832 was appointed to Hereford Cathedral. His career as a composer began with his splendid anthem, "The Wilderness," which was probably written for the opening of the Hereford organ in that year. In 1834 it fell to him to conduct the Festival of the Three Choirs, and in the following year he resigned Hereford for Exeter Cathedral; and during the next six years his name became gradually more and more widely known. In 1842 Dr Hook, afterwards dean of Chichester, offered him a large salary to become organist of Leeds parish church, and at Leeds much of his finest work as a composer was done. In 1849 he quitted this post for Winchester, and the pecuniary advantages for his sons. He was at Winchester until 1863, when he offered himself as a candidate for Gloucester Cathedral, the last of his many posts. He again conducted the Three Choirs Festivals of 1865, 1868, 1871 and 1874. A civil list pension of £30 a year was conferred on him in 1873; he died at Gloucester on the 10th of April 1876, and was buried at Exeter.

Like his father he was a very eccentric man; but his compositions show powers that are found in very few Englishmen of his date. If the Works of the Younger Wesley is a small book of his best work, are far more important and more extensive than most compositions elsewhere. He was a man of large proportion, and the talents of his life are not so much after his face. But even the compositions from which we make up an anthems of ordinary length. They are masterly in design, fine in inspiration and expression, and noble in character. His "Blessed be the God and Father of our Lord Jesus Christ," "already thou hast," "Ascribe unto the Lord," "O Lord, Thou art my God," and many others, are masterpieces in their way, and in all of these, as in the service in E., published with a rather trenches preface in 1845, there is a happy combination of resources of harmony with the tempered cathedral style, a combination which naturally alarmed the orthodox party of his time.

**WESLEYAN METHODIST CHURCH**, one of the chief branches of Methodism (q.v.). On the day of John Wesley's death the preachers in London sent a brief note to those stationed in the country. "Dear Brother, The melancholy period we have so long dreaded is now arrived. Our aged and honoured Father, Mr Wesley, is no more! He was taken to Paradise this morning, in a glorious manner, after a sickness of five days. We have not time to say more at present relative to his Demise. Only what respects out future Oeconomy. This injunction he laid upon us, and all our Brethren on his death-bed, That we each continue in our respective Station till the time appointed for the next Conference at Manchester. We have, therefore, no doubt but you will, with us, readily comply with his Dying Request. The more so, as this is consonant with the determination of the Conference held at Bristol when he was supposed to be near death there, and confirmed in succeeding Conferences."

In 1790 there were 294 preachers and 71,665 members in Great Britain, 19 missionaries and 5300 members on the mission stations; 198 preachers and 43,625 members in the United States. The 6th of April was kept as a day of fasting and prayer, and the 1st of July was thus set apart in order to seek divine guidance for the approaching conference. The crisis was serious. The large proportion of Wesley's members had been gathered by the preachers of his own sect. He had been taught to observe the sacraments and naturally desired that provision should be made for their administration in their own chapels. Some felt that they could not go to the Lord's Table where the clergyman was a worldly man; others went, but with much fear and doubt. The Church party was influential and resolute to maintain close relations with the Church of England. Their object was to prevent Methodism becoming independent. There was also a small but determined party that leaned to dissent. The struggle between these conflicting tendencies soon began. On the 30th of March 1791 nine preachers sent out the famous Halifax circular making suggestions as to the choice of president and other matters that must come before the conference. The first signature to this circular was that of William Thompson who was afterwards elected as the first president. On the 4th of May eighteen laymen met at Hull and expressed their conviction that the usefulness of Methodism would be promoted by its continued connection with the Church of England. They would not consent to the administration of the sacraments by the preachers in Hull, nor to Methodist preaching at the time when Wesley's preachers held in church. A trenchant reply to this circular was prepared by Alexander Kilham (q.v.), one of the younger Methodist preachers.

The conference met in Manchester on the 26th of July 1791. A letter from Wesley (dated Chester, April 7, 1785) was read, beseeching the members of the Legal Conference not to use their powers for selfish ends but to be absolutely impartial in stationing the preachers, selecting boys for education at Kingswood School, and disposing of connexional funds. The conference at once resolved that all privileges conferred by Wesley's Poll Deed should be accorded to every preacher in full connexion. To supply the lack of Wesley's supervision the circuits were now grouped together in districts. At first the preachers of the district elected their own chairman, but they were afterwards appointed by the conference. Regulations as to its business were issued in 1812. As to the sacraments and the relations of Methodism to the Church of England the decision was: "We engage to follow strictly the plan which Mr Wesley left us." This was ambiguous and was interpreted variously. Some held that it forbade the administration of the sacraments outside the Church; others they might be administered in the Church. But that it left Methodism free to follow the leadings of Providence as Wesley had always done. During the year the difficulties of the situation became more apparent. Wesley had given the sacrament to the societies when he visited them and this privilege was greatly missed. The conference of 1792 was so much perplexed that it resorted to the casting of lots. The decision was thus reached that the sacraments should not be administered that year. This was really shelving the question, but it gave time for opinion to ripen, and in 1793 it was resolved by a large majority that "the societies should have the privilege of the Lord's Supper in the forms which, in the Conference's opinion, were most calculated to promote the most genuine and useful spirit of devotion and love in the meetings for the administration of the Lord's Supper, so far as the same may be conducted by the preachers, unless a majority of the trustees, stewards and leaders of any chapel approved, and assured the conference that no separation was likely to ensue. The consent of conference had to be given before any change was made.

In 1796, Alexander Kilham, who refused to abstain from agitation for further reform, and accused his brethren of priestcraft, was expelled from their ranks and the New Connexion was formed with 5000 members (see METHODIST NEW CONNECTION). The conference of 1797 set itself to remove any ground for distrust among the societies and to enlist their hearty support in all branches of the work. Annual accounts were to be published of various funds. The Circuit Quarterly Meeting had to approve the arrangements for the support of the preachers. The preachers had long been accustomed to consult the leader's meetings of their societies, but it was now clearly decided that stewards and leaders should be appointed in connexion with the leaders' meeting, and certain rights were granted to that meeting as to the admission and expulsion of members. Local preachers had to be accepted by the local preachers' meeting, and the powers of trustees of chapels were considerably extended. The constitution of Methodism thus practically took the shape which it retained till the admission of lay representatives to conference in 1878. No period in the history of Methodism was more critical than this, and in none was the prudence and good sense of its leaders more conspicuous. Advance was quietly made along the lines now laid down. The preachers had agreed in 1793 that all distinction between those
whom Wesley had ordained and their brethren should cease. In the minutes of conference for 1818 "Rev." appears before the names of preachers who were members of the Missionary Committee. Jabez Bunting (q.v.), who had become the acknowledged leader of the conference, wished to have its young ministers set apart by the imposition of hands, but this scriptural custom was not introduced till 1836.

Meanwhile, Methodism was growing into a great missionary church. Its work in the West Indies was firmly established in Wesley's lifetime. In 1786 eleven hundred negroes were received into the society in the island of Barbadoes, and the number of superintending these missions and providing funds for them had so far retarded on Dr Coke, who took his place as the missionary bishop of Methodism. In 1813 he prevailed on the conference to sanction a mission to Ceylon. He sailed with six missionaries on the 30th of December, but died in the following May in the Indian Ocean. To meet these new responsibilities a branch Missionary Society had been formed in Leeds in October 1813, and others soon sprang up in various parts of the country. The Centenary of the Missionary Society falls in 1913, but Mr T. E. Mort, Miss Mort's really date from 1766 when Dr Coke landed at Antigua. The American missions were opened in 1791, and Missions were begun in Madras, at the Cape of Good Hope, in Australia, and on the west coast of Africa. Two missionaries were sent to the Friendly Islands in 1826, and in 1835 a mission was undertaken among the cannibals of Fiji, which spread and deepened till the whole group of islands was transformed. The work in China began in 1831: the Burma mission was established in 1837. The rapid progress of the Transvaal and Swaziland missions has been almost embarrassing. The Missionary Jubilee in 1863-68 yielded £179,000 for the work abroad. As the growth of these missions permitted conferences have been formed in various countries. Upper Canada had its conference in 1834, France in 1852, Australia in 1855, South Africa in 1882. The missionary revival which marked the Nottingham Conference of 1906 quickened the interest at home and abroad and the Foreign Field (monthly) is prominent among missionary periodicals. The Women's Auxiliary, founded in 1858, kept its jubilee in 1908. It supports schools and medical missions, homes and orphanages. In 1828 the erection of an organ in Brunswick Chapel, Leeds, led to a violent agitation and a small body of Wesleyan Methodists, dissenting from the church, came away. This division was led by Dr Warren, a preacher of ability and influence, who was disappointed because no place was found for him in the newly-formed Theological Institution. He tried to awaken general opposition to the Institution scheme, and being suspended from his office as superintendent by a special district meeting, appealed to the law courts, which sustained the action of the district meeting. He was expelled from the conference and joined the Wesleyan Methodist Association in 1836, but shortly afterwards became a clergyman in Manchester. In his first conference in 1744 Wesley asked, "Can we have a seminary for labourers?" The answer was: "If God spare us to another Conference." Next year the subject was broached with the reply: "Not till God give us a proper tutor." The idea was not realized in his lifetime, but Wesley did everything in his power to train his preachers. He gathered them together and read with them as he had done with his pupils at Oxford; he urged them to spend at least five hours a day in reading the best books. He made this challenge, "I will give each of you, as fast as you will read them, books to the value of £5." In 1834 Hebdale Academy was taken as a training place for ministers; and in 1839 the students moved to Abney House, Stoke Newington. Didsbury College was opened in 1843, Richmond in 1843. Headingley was added in 1868, Handsworth in 1881.

The Centenary of Methodism was celebrated in 1839 and £221,939 was raised as a thank-offering; £71,600 was devoted to the colleges and schools; £75,000 was given to the missionary society, which spent £50,000 on a new building for the Abney House in Bishopsgate Within; £38,000 was set apart for the removal of chapel debts, &c.

Methodism was now recognized as one of the great moral and spiritual forces of the world. Its progress was rapid, but in 1849 there came a disastrous check. There was much jealousy of Dr Bunting, the master mind of Methodism, to whose foresight and wisdom large part of its success was due. Fly-sheets were issued attacking him and other eminent ministers. James Everett, Samuel Dunn and William Griffith were expelled from the ministry, and an attempt was made to prevent them from meeting till a large debt had been paid. Those who now led the Connexion joined the reformers of 1838 and 1836 and formed the Methodist Free Churches. In 1852 the Missions of the Connexion were reorganized by the Methodist New Connexion, and the June Quarterly Meeting obtained the right to approve conference with memorials. Various other provisions were made which increased confidence. It was not till 1856 that the Connexion began to show signs of recovery from the shock. The following year, 1857, the New Connexion was dissolved, and the June Quarterly Meeting obtained the right to approve conference with memorials. Various other provisions were made which increased confidence.

Methodism began its work for popular education in a very modest way. In 1837 it had nine infant schools and twenty-two schools for children. A grant of £5000 was made from the Centenary Fund for the provision of Wesleyan day schools. In 1844 the Connexion, under the direction of 1843, directed that greater attention must be given to this department, and a committee met in the following October which selected 700 schools for the next seven years, and an Education Fund raised of £5000 a year. In 1849 the Normal Training College for the education of day-school teachers was opened at Westminster, and in 1872 a second college was opened in Battersea for school-mistresses. Westminster provides for 120 and Southlands for 110 students. They supply teachers not only for Wesleyan, but for council schools all over the Kingdom. They have also received grants from the various day-schools. Methodism possesses the Lexden Schools, Castle Hill, Mount at Colwyn Bay and prosperous boarding-schools for boys and girls in many parts of the country.

Methodism has also done much work in the army. Dr William Harris Rule (1802-1890), who was appointed chaplain at Gibraltar in 1832, won for it fuller recognition from the authorities. Charles H. Kelly, his colleague at Aldershot, and R. W. Allen had been at Blackheath during the war, and were in the army. When the army and the navy was developed. Capitation grants have made it possible to organize the work at every station at home and abroad. The work of the army and navy carried on by soldiers is done, to a great extent, by the men. The service done by Methodist chaplains in war time, and especially in the Boer War, won the warmest recognition from the authorities.

Laymen were introduced into the Wesleyan conference. They had been members of the committee appointed in 1803 to "guard our privileges in these perilous times," and had gradually taken their place on the missionary and other committees. Circuit and district meetings were increased, and the laymen's right to attend and their right to attend was established. Some of the Annuity Committee were created in 1819 and the financial business of each district soon came under its control. Out of the Annual Home Missionary gathering sprang a system of committees of review which, in 1852, James H. Rigg suggested might be enlarged and combined into a kind of diet composed of representatives of all the classes and levels of society. This was called the Commission, which was composed of 300 ministers and 300 laymen. In 1892 the district meeting became known as the District Synod, and in 1893 the circuits began to choose representatives to the Synod in addition to the circuit stewards. The great advance in organization made with such peace and goodwill was commemorated in 1878 by the Thanksgiving Fund which reached £297,500. Dr Rigg, the president of that year, put £2000 into the movement, and every department of Methodist work at home and abroad showed the benefits of the fund.

The Forward Movement in Methodism dates from that period. A bolder policy won favour. Methodism realized its strength and position. Its work in the colonies. The Missions to Africa. Methodist missions to India were founded in 1819. The President of the Missionary Committee, the Rev. Peter Thompson was sent to work in the East End. Next year the Revs. Hugh Price Hughes and Mark Guy Pearson began the West London Mission. Every succeeding year has seen a rapid development of the work. Missions have been built in the principal towns of England, Scotland and Ireland. Great congregations have been gathered, and the work done for uplifting the fallen and outcast has earned the gratitude of all good men. The Manchester mission is regarded as one of the glories of that city. The Forward Movement will always be associated with the name of Hugh Price Hughes (q.v.). Village Methodism shared in this development, and has increased in numbers and in the large towns. Chapels which had been closed were reopened; an entrance was found into many new villages. Weak circuits were grouped together and gained energy and development. Methodism was behind the Home Mission of that National Children's Home and Orphanage founded by Dr Bowman Stephenson in 1869. Its headquarters are in Bethnal Green, but it has branches in various parts of the country. It cares not only for waifs and strays, but for cripples and delicate children. Orphans of respectable parents have a home at Birmingham,
and the reformatory school has done splendid service for lads who have committed a first offence. Dr A. E. Gregory, who in 1900 succeeded Dr Stephenson, has seen remarkable progress in all departments of the great institution under his care. Sir Simon Relton, who was a training and home at Ilkeley, founded by Dr Stephenson in 1902, also has done much to help in these modern developments of Methodism.

The Chapel Committee, which has its headquarters in Manchester, has a staff of over 250 and a total weekly attendance of about twenty-five millions. The number of Methodist chapels in 1818 was 2000; in 1839, 3500; in 1890, 8666. The sitting increased from a million in 1851 to about 2,375,000. The total expenditure of the society in that period has been about twenty millions. Debts amounting to £2,266,013 have been paid off since 1854. More than half a million has been advanced in loans and of this nothing has been paid off, the whole amount is still outstanding and of this £892,114 was contributed. London Methodism owes more than can be told to the Metropolitan Chapel Building Fund which was founded in 1861. The names of the Rev. Williams and Sir Francis Lyttel, Sir W. N. M'Arthur, will always be associated with this fund which has promoted the erection of some hundred new chapels. The Extension Fund, established in 1872, largely by the help of Sir Francis Lyttel and Mr M'Arthur, has done more for the churches in the villages and country. About two thousand chapels have been assisted with grants and loans. Similar work has been done in Scotland by a fund established in 1878. North and South Wales also have benefited by this extension fund. A secretary and committee were appointed in 1905 to carry out these developments of work in London. The work of the Metropolitan Chapel Building Fund and the London Mission is taken over by this new committee.

In the case of Sunday schools which began to spring up all over England in the last years of the life of Wesley, the first rules for the management of Methodist Sunday schools were issued by the Conference in 1827. In 1857 there were 3,339,160 scholars in 953,614 schools. A quarter of the preaching places, however, had no schools. The Education Committee was formed in 1838 to take oversight of the work of the Methodist Sunday School Union, which was founded in 1873, was formed into a department in 1897 and is doing much to guide and develop the work. The Temperance Committee was formed in 1875; a temperance secretary was set apart in 1880 and the temperance work has been conducted by a committee in Westminster. The Wesley Guild Movement, established in 1901, has its headquarters in Leeds and is doing a great work for the young people of Methodism.

The date of his death was kept in 1891. Memorable services were held in City Road Chapel, which was restored and rendered more worthy of its historic position. Wesley's station was placed in the foreground. In 1898 the rooms in Wesley's house, where for country and urban villages. About two thousand chapels have been assisted with grants and loans. Similar work has been done in Scotland by a fund established in 1878. North and South Wales also have benefited by this extension fund. A secretary and committee were appointed in 1905 to carry out these developments of work in London. The work of the Metropolitan Chapel Building Fund and the London Mission is taken over by this new committee.

The date of his death was kept in 1891. Memorable services were held in City Road Chapel, which was restored and rendered more worthy of its historic position. Wesley's station was placed in the foreground. In 1898 the rooms in Wesley's house, where for country and urban villages. About two thousand chapels have been assisted with grants and loans. Similar work has been done in Scotland by a fund established in 1878. North and South Wales also have benefited by this extension fund. A secretary and committee were appointed in 1905 to carry out these developments of work in London. The work of the Metropolitan Chapel Building Fund and the London Mission is taken over by this new committee.

In the case of Sunday schools which began to spring up all over England in the last years of the life of Wesley, the first rules for the management of Methodist Sunday schools were issued by the Conference in 1827. In 1857 there were 3,339,160 scholars in 953,614 schools. A quarter of the preaching places, however, had no schools. The Education Committee was formed in 1838 to take oversight of the work of the Methodist Sunday School Union, which was founded in 1873, was formed into a department in 1897 and is doing much to guide and develop the work. The Temperance Committee was formed in 1875; a temperance secretary was set apart in 1880 and the temperance work has been conducted by a committee in Westminster. The Wesley Guild Movement, established in 1901, has its headquarters in Leeds and is doing a great work for the young people of Methodism.

arranged, so that it is not possible to single out any one as the centre of the whole system. The authority of the Bible Wesselin would support when necessary, not by the priest but by the divinity professor. His views on the sacraments anticipated those of Zwingli rather than Luther.

See Vita Wesseli Groningensis, by Albert Hardenberg, published in an incomplete form in the preface to Wesselin's collected works (Amsterdam, 1611; this preface also contains extracts from the work, and is in the handwriting of a writer who had evidently read a text of Wesselin). W. Murerling, Com. Hist. Theol. de Wesseli Gansfortii vita, &c. (1831); K. Ullmann, Reformers before the Reformation (the second edition in German is a second, but larger edition of a previous work entitled Johann Wesselin, ein Vorgänger Luther's (1834); J. Friedrich, Johann Wesselin, ein Bild aus der Kirchengeschichte Luthers &c. (1823); A. Rischel, History of the Reformers, Justification and Reconciliation (Edinburgh, 1872); J. J. WESSELNYI—WESSEX

WESSELNYI, MIKLÓS, BARON (1766-1850), Hungarian statesman, son of Baron Miklós Wesselényi and Iolna Cseréi, was born at Zátó, and was educated at his father's castle by Mózes Pataky in the most liberal and patriotic direction. In 1823 he permanently entered public life and made the acquaintance of Count Stephen Széchenyi whom he became one of the leaders of the liberal movement in the Upper House. In 1833 appeared his Balitólelek (Prejudices), which was for long a prohibited book. He was the foremost leader of the Opposition at the diet of 1834, and his freely expressed opinions on land-redemption, together with his efforts to give greater publicity to the debates of the diet by printing them, involved him in three ill-advised revolutionary propositions. He was imprisoned at Gräfenberg, whither he had gone to be cured of an eye trouble, and two years later became quite blind. Subsequently he did much for agriculture, children's homes and the introduction and extension of the silk industry in Hungary. The events of 1848 brought him home from a long residence abroad, but he was no longer the man he had been, and soon withdrew again to Gräfenberg. He died on the 21st of April 1850, on his way back to Hungary.

See Perencze Szilágyi, Life and Career of Baron Nicholas Wesselényi the Younger (Hun. Budapest, 1876).

WESSEX, one of the kingdoms of Anglo-Saxon Britain. The story of its origin is given in the Saxon Chronicle. According to this the kingdom was founded by two princes, Cerdic, and Cynric his son, who landed in 494 or 495 and were followed by other settlers in 501 and 514. After several successful battles against the Welsh they became kings in 510. Very few of the localities connected with the story of these kingdoms can be identified with certainty, but such identifications as there are point to the southern part of Hampshire. In 530 Cerdic and Cynric are said to have conquered the Isle of Wight, which they gave to two of their relatives, Stuf and Whittac. Cynric died in 534. Cynric defeated the Britons at Salisbury in 535 and again in conjunction with his son Cælin at Beranbrough, probably Barbury Hill, in 536. At his death in 540 he was succeeded by Cælin, who is mentioned by Bede as the second of the English kings to hold an imperium in Britain. With him we enter upon a period not perhaps of history, but at least of more or less reliable tradition. How far the earlier part of the story deserves credence has been and still is much debated. At all events no value can be attached to the dates given in the Chronicle. The preface to this work places Cerdic's assumption of the sovereignty six years after his landing, that is, in the year 500, and assigns him a reign of sixteen years, which makes his death fall eighteen years before 534, the date recorded in the annals. Again, while the annals record Cælin's accession in 540 and his expulsion in 542, the preface with other early authorities assigns him a reign of only seven years. Another noticeable discrepancy is, in the Chronicle and elsewhere, represent Cynric as grandson of Cerdic and son of a certain Creoda. Suspicion likewise attaches to the name Cerdic, which seems to be Welsh, while we learn from Bede that the Isle of Wight, together with part at least of the Hampshire coast, was colonized by Jutes, who apparently had a kingdom distinct from that of Wessex. For these reasons the story of the foundation of Wessex, though it appears to possess considerable antiquity, must be regarded as open to grave suspicion. It is worthy of note that the dynasty claimed to be of the same origin as the royal house of Bernicia and that two of Cerdic's ancestors, Freawine and Wig, figure in the story of Vermund, king of Angel.

Whatever may be the truth about the origin of the kingdom, and it is by no means impossible that the invasion really proceeded from a different quarter, we need not doubt that its dimensions were largely increased under Cælin. In his reign the Chronicle mentions two great victories over the Welsh, one at a place called Bedicanford in 571, by which Aylesbury and the upper part of the Thames valley fell into the hands of the West Saxons, and another at Deorham in 577, which led to the capture of Gloucester, Bath and Gloucester. Cælin is also said to have defeated Æthelberht at a place called Wilcombain (possibly Wimbledon) in 568. In 592 he was expelled and died in the following year. Of his successors Ceol and Ceawlin we know little though the latter is said to have been engaged in constant warfare. Ceawlin was succeeded in 611 by Cynewigis, whose son Cwichelm provoked a Northumbrian invasion by the attempted murder of Edwin in 626. These kings are also said to have come into collision with the Mercian king Penda, and it is probable that the province of the Hwicae (g.) was lost in their reign. With the death of the Mercian king Æthelberht, who was not Cynewigis's daughter, to the throne of Northumbria, both Cynewigis and Cwichelm were baptized. Cynewigis was succeeded in 642 by his son Cenwalh, who married and subsequently divorced Penda's sister and was on that account expelled by that king. After his return he gained a victory over the Welsh near Pen-selwood, by which a large part of Somerset came into his hands. In 661 he was again attacked by the Mercians under Wulhere. At his death, probably in 573, the throne is said to have been held for a year by his widow Seaxburh, who was succeeded by Aescwine, Cynewigis's daughter, and Cenwalh's wife. Cynewigis, however, the kingdom was in a state of disunion from the death of Cenwalh to the accession of Ceawlin in 685, which greatly increased its prestige and conquered the Isle of Wight, the inhabitants of which he treated with great barbarity. After a brief reign Ceawlin went to Rome, where he was baptized, and died shortly afterwards, leaving the kingdom to Ine. By the end of the 7th century a considerable part at least of Devonshire as well as the whole of Somerset and Dorset seems to have come into the hands of the West Saxons. On the resignation of Ine in 756, the throne was obtained by Æthelheard, apparently his brother-in-law, who had to submit to the Mercian king Æthelberht, whom he seems to have been attacked in 733. Cuthred, who succeeded in 740, at first acted in concert with Æthelbeald, but revolted in 752. At his death in 736 Ægberht succeeded. The latter, however, on account of his misgovernment was deserted by most of the leading nobles, and with the exception of Hampshire the whole kingdom came into the hands of Cynwulf. Ægberht, after putting to death the last of the princes who remained faithful to him, was driven into exile and subsequently murdered, but vengeance was afterwards taken on Cynwulf by his brother Cynewigis. Cynwulf was succeeded in 796 by Bertric, who married Eadburg, daughter of the Mercian king Offa. Her violent and murderous conduct led to the king's death in 802; and, it is said, caused the title of queen to be denied to the wives of later kings. Bertric was succeeded by Ægberht (q.v.), the chief event of whose reign was the overthrow of the Mercian king Beorhnoth in 825, which led to the establishment of West Saxon supremacy and to the annexation of Wessex, Sussex, Surrey, Kent and Essex.

Æthelward (q.v.), son of Ægberht, succeeded to the throne of Wessex after the murder of Æthelnoth in 839, while the eastern provinces went to his son or brother Æthelstan. A similar division took place on Æthelwald's death between his two sons Æthelred and Æthelberht, but on the death of the former in 858 Æthelberht united the whole in his own hands, his younger brothers Æthelred and Alfred renouncing their claims. Æthelberht was succeeded in 865 by Æthelred, and the latter by Alfred in 871. This was the period of the great Danish invasion which culminated
in the submission of Guthrum in 878. Shortly afterwards the kingdom of the Mercians came to an end and their leading earl, Æthelred accepted Alfred's overlordship. By 886 Alfred's authority was admitted in all the provinces of England which were not under Danish rule. From this time onwards the history of Wessex is the history of England.

of Harvard College, made in 1639 and revoked in 1660 by the General Court of Massachusetts). In 1717 this part of Marlboro, with other lands, was erected into the township of Westboro, to which parts of Sutton (1726), Shrewsbury (1726 and 1732) and Upton (1753) were subsequently annexed, and from which Northboro was separated in 1766.

WEST BROMWICH, a market town and municipal, county and parliamentary borough of Staffordshire, England, 6 m. N.W. of Birmingham, on the northern line of the Great Western railway. Pop. (1851) 59,338, (1901) 65,175. The appearance of the town, like its growth as an industrial centre of the Black Country, is modern. It is, however, of ancient origin; thus the church of All Saints, formerly St Clement, was given by Henry I. to the convent of Worcester, from which it passed to the priors of Sandwell, who rebuilt it in the Decorated period, the present structure (1872) following their plan. The chief public buildings are the town hall (1875), the Institute (1886), providing instruction in science and art, under the corporation since 1894, the free library (1874) and law-courts (1891). The picturesque Oak House, of the 16th century, was opened as a museum and art gallery in 1898. Among schools is one for pauper children in which engineering, baking, spade-husbandry, &c., are taught. Sandwell Hall, formerly a seat of the earls of Dartmouth, contains a school for daughters of clergymen, &c. The house, standing in pleasant wooded grounds, is on the site of the Benedictine priory of Sandwell, founded in the time of Henry II. There are charities founded by the families of Stanley and Whorwood (1613 and 1614). Dartmouth Park is a recreation ground of about 60 acres; others are Farley, Kenwick and Hill Top Park. Numerous mines work the extensive coalfields, which include a thirty-foot seam. There are large iron and brass foundries and smelting furnaces, and malting and brickmaking are carried on. The parliamentary borough returns one member. The town is governed by a mayor 6 aldermen and 18 councillors. Area, 4,880 acres.

WESTBROOK, a city of Cumberland county, Maine, U.S.A., on the Presumpscot river, 3 m. N.W. of Portland. Pop. (1890) 66,32, (1900) 72,83 (1673 foreign-born), (1910) 8,281. It is served by the Maine Central and the Boston & Maine railways. In Westbrook are the Walker Memorial Library (1894) and the Warren Library (1879). The river provides water-power, and among the manufactures are paper, silks, cotton goods, &c. In 1814 Westbrook was separated from Falmouth and incorporated as a town, with the name of Westbrook, and in 1815 the present name was adopted in honor of Colonel Thomas Westbrook, who had distinguished himself in wars with the Indians. In 1871 Deering, now a part of Portland, was taken from the township. A city charter was granted to Westbrook in 1889 and adopted in 1891.

WESTBURY, RICHARD BETHELL, 1ST BARON (1800–1873), lord chancellor of Great Britain, was the son of Dr Richard Bethell, and was born at Bradford, Wilt. Taking a high degree at Oxford in 1818, he was elected a fellow of Waltham College. In 1823 he was called to the bar at the Middle Temple. On attaining the dignity of queen's counsel in 1830 he rapidly took the foremost place at the Chancery bar and was appointed vice-chancellor of the county palatine of Lancaster in 1831. His most important public service was the reform of the then existing mode of legal education, a reform which ensured that students before call to the bar should have at least some acquaintance with the elements of the subject which they were to profess. In 1831 he obtained a seat in the House of Commons, where he continued to sit, first as member for Aylesbury, then as member for Wolverhampton, and in 1846 was returned as member for Westminster. On being called to the liberals, he became solicitor-general in 1832 and attorney-general in 1856 and again in 1859. On June 26, 1861, on the death of Lord Campbell, he was created lord high chancellor of Great Britain, with the title of Baron Westbury of Westbury, county Wilts. The ambition of his life was to set on foot the compilation of a digest of the whole law, but for various reasons this became impracticable. The conclusion of his tenure of the chancellorship was unfortunately marked by events which, although they did not render personal corruption imputable to him, made it evident that he had acted with some laxity and want of caution. Owing to the reception by parliament of reports of committees nominated to consider the circumstances of certain appointments in the Leeds Bankruptcy Court, as well as the granting a pension to a Mr Leonard Edmunds, a clerk in the patent office, and a clerk of the parliaments, the lord chancellor felt it incumbent upon him to resign his office, which he accordingly did on the 4th of July 1865, and was succeeded by Lord Cranworth. After his resignation he continued to take part in the judicial sittings of the House of Lords and the privy council until his death. In 1872 he was appointed arbitrator under the European Assurance Society Act 1872, and his judgments in that capacity have been collected and published as the "Arbitration of Lord Westbury’s Cases." He was the author of "The Bar in England," and of a "Memoir of Mr. F. S. Reily." As a writer on law he made no mark, and few of his decisions take the highest judicial rank. Perhaps the best known is the judgment delivering the opinion of the judicial committee of the privy council in 1863 against the heretical character of certain extracts from the well-known publication Essays and Reviews. His principal legislative achievements were the passing of the Divorce Act 1857, and of the Land Registry Act 1862 (generally known as Lord Westbury’s Act), the latter of which in practice proved a failure. What chiefly distinguished Lord Westbury was the possession of a certain sarcastic humour; and numerous are the stories, authentic and apocryphal, of his exercise. In fact, he and Mr Justice Maule fill a position analogous to that of Sydney Smith, convenient names to whom "good things" may be attributed. Lord Westbury died on the 20th of July 1873, within a day of the death of Bishop Wilberforce, his special antagonist in debate.

See Life of Lord Westbury by T. A. Nash.

WESTBURY, an urban district in the Westbury parliamentary division of Wiltsshire, England, on the river Biss, a small tributary of the Lower Avon. Pop. (1891) 3205. It is 95 m. W. by S. of London by the Great Western railway, and lies within 1 m. of the Somerset border, sheltered on the east by the high tableland of Salisbury Plain. All Saint's church is Norman and later, with a magnificent nave. In the south transept stands a monument to Sir James Ley, earl of Marlborough and president of the council in 1620; the "good earl" addressed in a sonnet by Milton. A chained black-letter copy of Erasmus’ Paraphrase of the New Testament is preserved in the south-chapel. In the suburb of Westbury Leigh is the Palace Garden, a moated site said to have been a royal residence in Saxony times. Westbury (Wesberie, Wesbar) figures in Domesday as a manor held by the king. The manor was granted by Henry II. to Reginald de Pavey in 1172–1173, and from then onwards passed through various families until in 1810 it was purchased by Sir M. M. Lopez from the earl of Abingdon. A post mortem was held for Westbury in 1361–1362, but the earliest mention of the town as a borough occurs in 1442–1443. The charter of incorporation is lost (tradition says it was burnt), and the town possesses no other charter. The title of the corporation was "Mayors and Burgesses of Westbury," and it consisted of a mayor, recorder and 13 capital burgesses. The borough returned two members to parliament from 1448. In 1832 the number was reduced to one, and in 1885 the representation was merged in that of the county. In 1252 Henry III. granted to Walter de Pavey a yearly fair for three days from October 31, and a weekly market on Friday. Henry VI. in 1460 granted three fairs yearly for three days from April 22, Whit Monday and September 13 respectively, and a market on Thursdays. In 1835 the mayor's fair was held at Whitsuntide, and the lord of the manors of Easedale and Mitford, at his own cost, held one on the first Tuesday in September and a pleasure fair on Easter and Whitsunday; in 1888 on the first Tuesday in September and on the 24th of that month; the former still exists. In 1673 there was a market on Friday, in 1835 a nominal one on Tuesday and after 1875 it ceased. During the 18th and 19th centuries there was a considerable trade in malt, bricks, tiles and cloth. The last, once the most extensive, has now sunk into insignificance, while the others exist only on a small scale.
WES T C H E S T E R, a borough and the county-seat of Chester county, Pennsylvania, U.S.A., about 20 m. W. of Philadelphia. Pop. (1890) 8,215; (1900) 9,324, of whom 566 were foreign-born and 1777 were negroes; (1910 census) 12,267. West Chester is served directly by the Pennsylvania and the Philadelphia, Baltimore & Washington railroads and by an interurban electric line to Philadelphia; electric lines connect with the Philadelphia & Reading at Lenape, 4 m. to the south-west, and to Coatesville, 10 m. to the west. The borough lies about 450 ft. above sea-level in an undulating country. At West Chester are the West Chester State Normal School (1871), the Darlington Seminary (non-sectarian; for girls), founded in 1851 by Smeldy Darlington (1827–1899; principal of the school from 1851–1883), the Friends' (Orthodox) Select School. There are fine botanical gardens in Marshall Square. Among the public buildings are a county courthouse (1847–1848), a county jail and a county hospital (1892–1893), the public library and a large Y.M.C.A. building. The colonial Turk's Head Hotel here has been so called since 1768 and was probably first opened in 1762. West Chester is in a farming country with important market-gardens and dairy farms; among its manufactures are dairy implements, foundry work, mahogany, wagon and carriage manufactures and malted barley.

The factory product in 1905 was valued at $2,737,135. There are several large nursery farms here. West Chester was first settled in 1713, succeeded Chester as the county-seat in 1784–1786, and was incorporated as a town in 1788 and as a borough in 1799. During the War of Independence the battle of Brandywine was fought about 7 m. S. of West Chester on the 11th of September 1777, and on the 20th General Anthony Wayne, with a small force, was surprised and routed by the British at Paoli, about 8 m. N.E.

Westcott, BROWNE, Foss (1812–1901), English divine and bishop of Durham, was born on the 12th of January 1825 in the neighbourhood of Birmingham. His father, Frederick Brooke Westcott, was a botanist of some distinction. Westcott was educated at King Edward VI. school, Birmingham, under James Prince Lee, where he formed his friendship with Joseph Barber Lightfoot (q.v.). In 1844 Westcott obtained a scholarship at Trinity College, Cambridge. He took his William Browne's medal for a Greek ode in 1846 and 1847, the Members' Prize for a Latin essay in 1847 as an undergraduate and in 1849 as a baccelor. He took his degree in January 1854, obtaining double firsts in theology and mathematics. He was a first wrangler, Isaac Todhunter being senior. In classics he was senior, being bracketed with C. B. Scott, afterwards headmaster of Westminster. After obtaining his degree, Westcott remained for four years in residence at Trinity. In 1849 he obtained his fellowship; and in the same year he was ordained deacon and priest by his old headmaster, Prince Lee, now bishop of Manchester. The time spent at Cambridge was devoted to most strenuous study. He took pupils; and among his pupils there were reading with him, almost at the same time, his school friend Lightfoot and two other men who became his attached and lifelong friends, E. W. Benson and F. J. A. Hort (q.v.). The inspiring influence of Westcott's intense enthusiasm left its mark upon these three distinguished men; they regarded him not only as their friend and counsellor, but as in an especial degree their teacher and oracle. He devoted much attention to philosophical, patriotic and historical studies, but it soon became evident that he would throw his strength into New Testament work. In 1851 he published his Norrisian prize essay on the Epistle of St. John the Divine. In 1857 he became an assistant master at Harrow, and soon afterwards he married Miss Whithard. He prosecuted his school work with characteristic vigour, and succeeded in combining with his school duties an enormous amount both of theological research and of literary activity. He worked at Harrow for nearly twenty years under Dr. C. J. Vaughan and Dr. Montagu Butler, but while he was always consistently successful in inspiring a few senior boys with something of his own intellectual and moral enthusiasm, he was never in the same measure capable of maintaining discipline among large numbers. The writings which he produced at this period created a new epoch in the history of modern English theological scholarship. In 1855 he published the first edition of his History of the New Testament Canon, which, frequently revised and expanded, became the standard English work upon the subject. In 1859 there appeared his Characteristics of the Gospel Miracles. In 1860 he expanded his Norrisian essay into an Introduction to the Study of the Gospels, a work remarkable for insight and minuteness of study, as well as for reverential treatment combined with considerable freedom from traditional lines. Westcott's work for Smith's Dictionary of the Bible, notably his articles on Canon, "Maccabees," "Liturgy," and "Exegesis," resulted in a large volume, and led to the composition of his subsequent valuable books, The Bible in the Church (1864) and a History of the English Bible (1866). To the same period belongs The Gospel of the Resurrection (1866). As a piece of consecutive reasoning upon a fundamental Christian doctrine it deservedly attracted great attention. Its width of view and its recognition of the claims of historical science and pure reason were thoroughly characteristic of Westcott's mode of discussing a theological question. At the time when the book appeared his method of apologetic marksmanship was not only popular but was a standard pattern. The excellence of the work is impaired by the difficulty of the style. In 1865 he took his B.D., and in 1870 his D.D. He received in later years the honorary degrees of D.C.L. from Oxford (1881) and of D.D. from Edinburgh (1883). In 1868 Westcott was appointed examining chaplain by Bishop Connor Magee (of Peterborough); and in the following year he accepted a canony at Peterborough, which necessitated his leaving Harrow. For a time he contemplated with eagerness the idea of a renovated cathedral life, devoted to the pursuit of learning and to the development of opportunities for the religious and intellectual benefit of the diocese. But the regius professorship of divinity at Cambridge fell vacant, and Lightfoot, who was then Hulsean professor, declining to become a candidate himself, insisted upon Westcott's standing for the post. It was due to Lightfoot's support almost as much as to his own great merits that Westcott was elected to the chair on the 1st of November 1870. This was the turning-point of his life. He now occupied a great position for which he was supremely fitted, and at a juncture in the reform of university studies when a theologian of liberal views, but uninterruptedly respected for his mature learning and his doctrine, and slightly-minded but broad-minded and educated for usefulness, supported by his friends Lightfoot and Hort, he threw himself into the new work with extraordinary energy. He deliberately sacrificed many of the social privileges of a university career in order that his studies might be more continuous and that he might see more of the younger men. His lectures were generally on Biblical subjects. His Commentaries on St. John's Gospel (1881), on the Epistle to the Hebrews (1886) and the Epistles of St. John (1883) resulted from his public lectures. One of his most valuable works, The Gospel of Life (1892), a study of Christian doctrine, incorporated the materials upon which he was engaged in a series of more private and esoteric lectures delivered on week-day evenings. The work of lecturing was an intense strain to him, but its influence was immense: to attend one of Westcott's lectures—even to watch him lecturing—was an experience which lifted and solemnized many a man to whom the references to Origen or Rupert of Deutz were almost ludicrously unintelligible. Between the years 1878 and 1881 Westcott was also continually engaged in work for the revision of the New Testament, and, simultaneously, in the preparation of a new text in conjunction with Hort. The years in which Westcott, Lightfoot and Hort could thus meet frequently and naturally for the discussion of the work in which they were all three so deeply engrossed formed a happy and privileged period in their lives. In the year 1881 there appeared the famous Westcott and Hort text of the New Testament, upon which had been expended nearly thirty years of incessant labour. The reforms in the regulations for degrees in divinity, the formation and first revision of the new theological tripos,
the inauguration of the Cambridge mission to Delhi, the institution of the Church Society (for the discussion of theological and ecclesiastical questions by the younger men), the meetings for the divinity faculty, the organization of the new Divinity School and Library and, later, the institution of the Cambridge Clergy Training School, were all, in a very real degree, the result of Westcott's energy and influence as regius professor. To this list should also be added the Oxford and Cambridge preliminary examination for candidates for holy orders, with which he was from the first most closely identified. The success of this very useful scheme was due chiefly to his sedulous interest and help.

The departure of Lightfoot to the see of Durham in 1879 was a great loss to Westcott. He was compelled now to lead the take the lead in matters where Lightfoot's more practical nature had previously been predominant. In 1883 Westcott was elected to a professorial fellowship at King's. Shortly afterwards, having previously resigned his canonry at Peterborough, he was appointed by the crown to a canonry at Westminster, and accepted the position of examining chaplain to Archbishop Benson. His little edition of the Paragraph Psalter (1879), arranged for the use of choirs, and his admirable lectures on the Apocalypse (1882) and Historical Divinity (1883), are amongst the best results of his vacations spent at Peterborough. He held his canonry at Westminster in conjunction with the regius professorship. The strain of the joint work was very heavy, and the intensity of the interest and study which he brought to bear upon his share in the labours of the Ecclesiastical Courts Commission, of which he had been appointed a member, added to his burden.

Preaching at the Abbey gave him a valuable opportunity of dealing with social questions. His sermons were generally portions of a series; and to this period belong the volumes Christia Consummator (1886) and Social Aspects of Christianity (1887).

In March 1890 he was nominated to the see of Durham, there to follow in the steps of his beloved friend Lightfoot, who had died in December 1889. He was consecrated on the 1st of May at Westminster Abbey by Archbishop Thompson (of York), Hort being the preacher, and enthroned at Durham cathedral on the 15th of May. The change of work and surroundings could hardly have been greater. But the sudden immersion in the practical administration of a northern diocese gave him new strength. He surprised the world, which had supposed him to be a recluse and a mystic, by the practical interest he took in the mining population of Durham and in the great shipping and artisan industries of Sunderland and Gateshead.

Upon one famous occasion in 1892 he succeeded in bringing to a peaceful solution a long and bitter strike which had divided the masters and men in the Durham collieries; and his success was due to the confidence which he inspired by the extraordinary moral energy of his strangely "prophetic" personality, at once thoughtful, vehement and affectionate. His constant endeavour to call the attention of the Church to the religious aspect of social questions was a special note in his public utterances. He was a staunch supporter of the co-operative movement, and he was practically the founder of the Christian Social Union. He continually insisted upon the necessity of promoting the cause of foreign missions, and he gladly gave four of his sons for the work of the Church in India. His energy was remarkable to the very end. But during the last two or three years of his life he aged considerably. His wife, who had been for some years an invalid, died rather suddenly on the 28th of May 1901, and he dedicated to her memory his last book, Lessons from Work (1901). He preached a farewell sermon to the miners in Durham cathedral at their annual festival on the 29th of July. He was compelled by a short, sudden illness, and he passed away on the 27th of July.

Westcott was no narrow specialist. He had the keenest love of poetry, music and art. He was himself no mean draughtsman, and used often to say that if he had not taken orders he would have become an architect. His literary sympathies were wide. He never would tire of praising Euripides, while few men had given such minute study to the writings of Robert Browning. He followed with delight the development of natural science studies at Cambridge. He spared no pains to be accurate, or to widen the basis of his thought. Thus he had one summer vacation to the careful analysis of Conte's 'Postulates in Science'.

He studied assiduously The Sacred Books of the East, and earnestly contended that no systematic view of Christianity could afford to ignore the philosophy of other religions. The outside world was wont to regard him as a mystic; and the mystical, or sacramental, view of life enters, it is true, very largely into his teaching. He had in this respect many points of similarity with the Cambridge Platonists of the 17th century, and with F. D. Maurice, for whom he had profound regard. But in other respects he was very practical; and his strength of will, his logical and irresistible reasoning, and his habit of making his conclusions very evident in influence wherever the subject under discussion was of serious moment. He was a strong supporter of Church reform, especially in the direction of obtaining larger powers for the laity.

He kept himself aloof from all party strife. He describes himself when he says, "The student of Christian doctrine, because he strives after exactness of phrase, because he is conscious of the inadequacy of any one human formula to exhaust the truth, will be filled with sympathy for every genuine endeavour towards the embodiment of right opinion. Partial views attract personal ridicule. The principles which has made him in many cases a poor controversialist, it may be said that a more controversialist cannot be a real theologian" (Lessons from Work, pp. 84-85). His theological work was always distinguished by the place which he assigned to Divine Revelation in Holy Scripture and in the teaching of history. His own studies have largely contributed in England to the better understanding of the doctrines of the Resurrection and the Incarnation. His work in conjunction with Hort upon the Greek text of the New Testament will endure as one of the greatest achievements of English Biblical criticism. The principles which he laid down in the introduction to the text had been arrived at after years of elaborate investigation and continual correspondence and discussion between the two friends. The place which it almost at once took among scientific scholars in Great Britain and throughout Europe was a recognition of the great advance which it represented in the use and classification of ancient authorities. His commentaries rank with Lightfoot's as the best type of Biblical exegesis produced by the English Church in the 19th century.

The following is a bibliography of Westcott's more important writings, giving the date of the first editions:—Elements of the Gospel Harmony (1851); History of the Canon of First Four Centuries (1853); Characteristics of Gospel Miracles (1859); Introduction to the Study of the Gospels (1863); The Bible in the Church (1864); The Gospel of the Incarnation (1866); The Gospel of the Apocalypse (1867); Christian Themes in Holy Writ (1873); A Manual of Theology (1881); Commentary on the Epistle of St. John (1881); Commentary on the Epistle of St. Peter (1882); Commentary on the Epistle to the Hebrews (1882); From Strength to Strength (1890); The Epistle to the Hebrews (1892); The Incarnation and Common Life (1893); Some Lessons of the Revised Version of the New Testament (1897); Christian Aspects of Life (1897); Lessons from Westminster Abbey (1901); Lives by his son B. F. Westcott (1903), and by J. Clayton (1906).

WESTERLEY, a township of Washington county, Rhode Island, U.S.A., in the extreme S.W. part of the state, about 44 m. S.S.W. of Providence, separated from Connecticut on the W. by the Pawcatuck river, which forms the northern boundary
of the township also. Pop. (1800) 6813, (1900) 7241, (1788
being foreign-born and 185 negroes), (1905, state census) 8381,
(1910) 8606. Area, about 31 sq. m. Westerly is served by the
New York, New Haven & Hartford railway, and by interurban
electric lines connecting with Norwich and New London, Conn.
The township includes several small villages, connected by
electric railways, the best known being Watch Hill, which has
fine sea-bathing. Larger villages are Westerly, in the western
district of the township and at the head of navigation (for small
vessels) on the Pawcatuck river, and Niantic, in the north-
eastern part of the township. In Westerly there is a public
library (1894), with 23,523 volumes in 1909. Beyond Watch
Hill Point on the S.W. point of an L-shaped peninsula, running
first W, and then N., is Napatree Point, on which is Fort Mans-
field, commanding the N.E. entrance to Long Island Sound.
The township is the centre of the granite industry of the state;
the quarries are near the villages of Westerly and Niantic.
The granite is of three kinds: white statuary granite, a quartz
monzonite, with a fine even-grained texture, used extensively
for monuments; blue granite, also a quartz monzonite and also much
used for monuments; and red granite, a biotite granite, red
with mottling, grey in colour and rather coarse in texture, used for buildings. Among the manufactures are cotton and woolen goods, thread
and printing presses. The water supply is from artesian wells.
The first settlement here was made in 1661, and the township
was organized in 1669, when the present name was adopted
instead of the Indian Misquamicut (meaning "salmon") by
which it had been called. In 1686 the name was changed to
Havemshire, but in 1689 the present name was restored.
See Frederic Denison, "Westerly and its Witnesses," for Two Hundred
and Fifty Years, 1620-1870 (Providence, R.I., 1875).

WESTERMANN, FRANCOIS JOSEPH (d. 1794). French
general, was born at Molsheim in Alsace. At an early age he
entered a cavalry regiment, but soon left the service and went
to Paris. He embraced enthusiastically the ideas of the Revolution,
and in 1790 became greffier of the municipality of Haguenau.
After a short imprisonment on a charge of inciting émeutes at
Haguenau, he returned to Paris, where he joined Danton and
played an important part in the attack on the Tuileries on the
10th of August 1792. He accompanied Dumouriez on his cam-
paigns and assisted him in his negotiations with the Austrians,
being arrested as an accomplice after the general's defection.
He succeeded, however, in proving his innocence, and was sent
with the rank of general of brigade into La Vendée, where he
distinguished himself by his extraordinary courage, by the
audacity of his manoeuvres, and by his severe treatment of the
insurgents. After suffering a defeat at Châtillon, he vanquished
the Vendéans at Beaupréau, Laval, Granville and Baugé, and
in December 1793 annihilated their army at Le Mans and Savenay.
He was then summoned to Paris, where he was pro-
ounced with the Dantonist party and executed on the 5th
of April 1794.
See P. Holl, Nos généraux alsaciens ... . Westermann (Strassburg,
1900).

WESTERN AUSTRALIA, a British colonial state, forming part
of the Commonwealth of Australia. (For Map, see Aus-
tralia.) This portion of Australia lies to the west of 120° E.
longitude and to the north of 20° S. latitude. Its area is
1,660,000 sq. m., or 1,400 m. in length and 850
in breadth, and has a coast-line of 3900 m. It is divided into
five districts—Central, Central Eastern, South-Eastern, North
and Kimberley. The Central or settled district, in the south-
west, is divided into twenty-six counties. Apart from the coast
lands, the map presents almost a blank, as the major portion is
practically a dry waste of stone and sand, relieved by a few
shallow salt lakes. The rivers of the south are small—the Black-
wood being the most considerable. To the north of this are the Murchison and Gascoyne, the latter running from the
Upper Gosse to the sea through Toolbrunup and Toolomah, the
last is 400 m. long. Shark's Bay receives the Gascoyne (200 m. long), with its tributary the Lyons.
1 See T. N. Dale, The Chief Commercial Granites of Massachusetts,
New Hampshire and Rhode Island (Washington, 1908), Bulletin
354 of the United States Geological Survey.

Still farther north, where the coast trends eastward, the principal rivers are the Ashburton, the Fortescue and the De Grey. Kimberley district to the north-east has some fine streams—the
Fitzroy and Ord and their tributaries, on some of which (the
Mary, Elvira, &c.) are the goldfields, 250 m. south of Cambridge
Gulf. The Darling mountain range is in the south-west, Mount
William reaching 3000 ft; in the same quarter are Toolbrunup (3341 ft.), Ellen's Peak (3420), and the Stirling and Victoria
ranges. Gardner and Moreley are flat-topped ranges. Mount
Elizabeth rises behind Perth. Hampton tableland overlooks the
Wanneroo river, and the northern boundary of the Darling
ranges extends due west, while the contact with the south-west
ranges is a belt of Lower Palaeozoic and Mesozoic deposits; but the reappear-
ance of the granitic rocks at King George Sound and Albany may be
considered as the boundary of the Archean. The Darlington
coast, the scar of the Archean plateau forms the Darling Range
behind Perth. Further north, behind Shark's Bay, the plateau
recedes from the coast, and trends north-westward through the
Gascoyne Range. The tableland which extends to the north of the
Darling Range and the goldfield of Coolgardie were classified by
H. P. Woodward into six parallel belts, running northward and southward,
but with a slight trend to the west. The westernmost belt consists of clay
slates, quartzites and schists, and is traversed by dykes of diorite and felsite; the belt forms the western
part of the Archean plateau, along the edge of the coastal plain. The
second belt consists of gneisses and schists, and forms the western
part of the Archean plateau, the chief, particularly at Mount
Gibb-Maitland, is the Green-bushes tin-field, and various other minerals, such as
graphite and asbestos. Then follows a wide belt of granitic rocks; it has no permanent surface water and is bare of minerals, and,
therefore, named for the effective system of drainage and prospecting of the country to the east. This granitic belt
ends to the east in the first auriferous belt, which extends from the
Phillips river, on the southern coast, to Southern Cross, on the
Perth to Kalgoorlie railway; thence it goes through Mount Magnet, Lake
Austin and the Murchison Goldfield at Nannine, and through the
Peak Goldfield to the heads of the Gascoyne and Ashburton rivers.
To the east of this belt is a barren band of granites and gneises,
succeeded again eastward by the second auriferous belt, including the
chiefs goldfields of Westralia. They begin on the south with the
Dundas Goldfield, and the mining centre of Norseman; then to the
north follow the goldfields of Esperance, Mount Barlow, Mount
Boulder, and the now less important field of Coolgardie. This line continues thence through the goldfields of Leonora and Mount
Margaret, and reappears behind the western coast in the Pillarra
Range. The rocks of the central and northern districts, of sandstone
and other basic schists, traversed by dykes of granite, diorite and
porphyrite, with some peridotites. Some of the amphibolites have
been crushed and then silicified into jasperoids, so that they much
resemble altered sediments.

The Palaeozoic group is represented by the Cambrian rocks of the
Kimberley Goldfield, which have yielded Olenellus foresti. There
are no certain indications of the Cambrian rocks of Australia, while the Silurian is representated in the King Leopold Range of
Kimberley, and, according to H. P. Woodward, in the contorted,
unfossiliferous quartzites and shales of the Stirling Range, north of
Dundas. The rocks of the southern quarter are the Carboniferous,
and other basic schists, traversed by dykes of granite, diorite and
porphyrite, with some peridotites. Some of the amphibolites have
been crushed and then silicified into jasperoids, so that they much
resemble altered sediments.
between the Wooraloo and Minilya rivers. The upper and middle types of Carboniferous include coalmeasures with Sigmatopteris and Lepidodendron in the Kimberley district, and the coals of the Irwin coalfield, the age of which is proved by the internation of the coal seams with beds containing the ammonite *Phylloceras subhaqueo* from the *Carb. australis* of Western Australia. The Mesozoic rocks were discovered in 1861, and their chief outcrop is along the western coast plains of Western Australia between Geraldton and Perth. The fauna is obtained by many methods, but only for the most part by transport. In the fossils indicate a Lower Jurassic age; and, according to Etheridge, some of the fossils are Lower Cretaceous. The Collie coalfield, to the east of Bunbury, is generally regarded as Mesozoic. Its coal is inferior to that of Western Australia, and in some beds the average of 34 analyses is 11.77% of moisture, and 8.62% of ash. According to Etheridge its age is Permo-Carboniferous. The Karajini district contains Mesozoic rocks and the great plains of the north are an extension of the Great Australian Bight, whence they extend inland for 150 m. They have no surface water, but the rainfall in this district nourishes aridicous wells. The occurrence of marshes is rare and it is a rather dry land, but it is not so dry as the north, as it is now and then wet by the bores, as at Carnarvon, where they appear to be over 100 ft. in thickness. The coastal region also includes sheets of sand and sandstone, with deposits of brown coal as on the Fitzmaurice river on the south coast, and in the basin of the Gascoyne. The Archean plateau of the interior is covered by wide sheets of sublateral and lacustrine deposits, which have accumulated in the basins and these include beds of Recent age. They are the rocks of the interior, and confine the Kainozoic species. In places the materials have been roughly arrowed by river action, as in the north, and the deep lead of Kanowna. The clays contain the bones of the Diprotodon, so that they are probably of Upper Triassic age. The pre-Cambrian species are those that are represented by the basists of Bunbury and Black Point, north of Flinders Bay. A bibliography of Western geology has been issued by Maitland, Bulletin of the Geological Survey of Western Australia, No. 1, 1898. An excellent summary of the mineral wealth of the state has been given by Maitland, Bulletin 8, No. 4, 1900, pp. 7-23, also issued in the Year-book of Western Australia. The main literature of the geology of Western Australia is in the Bulletins of the Geol. Survey, and in the reports of the Mines Department. A general account of the gold-mining has been given by A. G. Charleton, 1907; and also by Donald Clark, Geol. Survey of New Zealand (1904). [W. G. Chambers, Flora.—Judged by its vegetable forms, Western Australia would seem to be older than eastern Australia, South Australia being of intermediate type. As in the case of Western Australia, the vegetation is also rich and southern and African on the western. There are few western and Polynesian representatives than in the eastern colonies. European forms are extremely scarce. Compared with the other side of Australia, a third of the genera on the south-west is almost wanting in the south-east. In the latter, 55, having more than ten species each, have 1260 species; but the former has as many as 55 of its 86 genera. There are 55 of the latter, the species in all generally peculiar. There are few natural orders and genera westward, but more species. Baron von Müller declared that "nearly half of the whole vegetation of the Australian continent has been transferred to the Western district, and the rest belongs to the Eastern territory." He includes 9 Malvaceae, 6 Euphorbiaceae, 2 Rubiaceae, 9 Proteaceae, 47 Leguminosae, 10 Myrtaceae, 12 Compositae, 5 Labiateae, 6 Cynoglossaceae, 13 Convolvulaceae, 16 Gramineae, 3 Fibrobaceae, 4 Euphorbiaceae, 6 Sapotaceae, and 6 Convolvulaceae, each with its separate species. The Melaleuca Leucomedon is the paperbark tree of settlers. The rigid-leaved Banksia is known as the honeysock. Cassininae are the heaths of the kingdom, and the Eucalyptus, the elegant eucalyptus. Beautiful flowering shrubs distinguish the south-west; and the deserts are all abode with flowers after a fall of rain. Poison plants are generally showy Leguminosae, Sida and the Gastrodiolum. The timber trees of the south-west are almost unequaled. Of the Eucalypts, the jarrah or mahogany, E. marginata, is first for value. It runs over five deep forest districts, and it is known in the west as the jarrah. Malcolm Fraser assigns 14,000 sq. m. to the jarrah, 10,000 to E. viminalis, 2300 to the karri (E. colosea or E. diversicolor), 2400 to York gum (E. leosplata), 800 to the red gum (E. angustifolia), and 500 to the marri (E. telephila). Not much good wood is got within 20 m. of the coast. The coachbuilder's coop rises over 300 ft. Morrel furnishes good timber and rich oil. An ever-increasing trade is done in the timber of the south-west. Fauna.—Among the mammals are the Macropus giganteus, M. irma, M. dama, M. brachyurus, Lagorchesis fasciata, Belomiga pigra, Pseudochires cooki, Dasyurus geoffroii, Tarsipes rostratus, Anachirus apicalis, Perameles obesa, Perameles myurus, Myrmecobius fasciatus. Fossil forms partake of the existing marsupial character, Diprotodon being allied to the wombat, and Phalanger the koala. South of the coast, the south-west; but the banded one, a species, is in Shark's Bay. Nocturnal phalangers live in holes of trees or in the ground. Carnivorous mammals are found in the south-west, and there are three kinds of wombat, the red or common wombat, Opossum the north-east, and Perameles pongamollaceus at Shark's Bay. The dalyge or Heterolepis lagotis is at Swan river and Hylpospriscus in the south-west. The platypus (Ornithorhynchus) and the echidna are the only forms of the monotremata. The seal, whale and dugong occur in the adjacent seas. The west is not so rich as the east of Australia in birds. Many forms are absent and others but poorly represented, though some are peculiar to the west. The timbered south-west has the greatest variety of birds, which are scarce enough in the dry and treeless district. Of lizards the west has 12 genera not found in eastern Australia. Of snakes there are but 15 species to 3 in Tasmania and 31 in New South Wales. While the poisonous sorts are 2 to 1 in the east, the venomous snakes are not so prevalent; but the platypus (Ornithorhynchus) is only an article of food. The freshwater fishes are not all like those of the east. They include the mullet, snapper, pipe fish, guard fish, bonita, rock cod, shark, saw fish, parrot fish and cobra. Under these classes the freshwater fishes of the south-west are divided for natives at Shark's Bay; the trepang or biche-de-mer is also met with in the north. Insects are well represented, especially Coleoptera, Lepidoptera, Hemiptera, Hemiptera and Diptera. Cattle.—With the little grassland over the whole area is considerable. Western Australia differs from the country to the east in having no extensive ranges to collect water, while the trade winds blow off the dry land instead of from the ocean; for these two reasons the climate is very dry. Thunderstorms often supply almost the only rainfall in the interior. The south-western corner, the seat of settlements, is the only portion where rain can be depended on; and even there few places have a rainfall of 40 in. As one goes northward the moisture lessens. The north-west and all the coast along to Kimberley, but most of that district suffer from such dryness. The south coast, exposed to polar breezes, with uninterrupted sea, has to endure lengthened droughts. In the Swan river region the rainfall is in winter, being brought by north-west winds, and summers have little moisture. While the south wind cools the settled region, it comes over the parched interior to the southern coast. The climate of South Australia, north and south, is the utmost, but it is from the south in summer to Kimberley and the north-west. In one season the land breeze is hot, in another cool, but always dry. The climate of the West is divided into two distinctive regions, the winter and the summer. The winter commences somewhat abruptly, being ushered in by heavy rains; it begins usually not earlier than the middle of April or later, and lasts 83 days or 2 months, and ends the first of October. The winters are, as a rule, very mild, but there is some cold weather in July and August, and though there is little at the coast, frost is not uncommon inland. The summer is heralded by an occasional hot day in October, in November the weather becomes settled and continues warm until the end of March. In the four months, December to March, the maximum temperature in the shade reaches one on an average on 37 days, but as a rule the heat does not last long, the evenings and nights being tempered by a cool breeze. In the interior the climate resembles that of the south-west in regard to the occurrence of two seasons only. The winter, however, has much less rain than on the coast, and is cold, clear and bracing. The summer, as a rule, hot, but is tempered in the south by occasional cool changes, though unrelied as the tropic is approached. Within the tropics there are two seasons, the wet and the dry. The winter is most unpleasant, the temperature rarely falling below 100°F.; the dry season, which lasts from April to October, is much more comfortable. There is 1 in 6 or 10 at Perth is 23 in. falling on 110 days; the mean maximum temperature is 74° in the month of July; and the minimum 51°F.; at Coolgardie the mean maximum temperature is 77°-8° in the month of August, and the mean minimum 51-9° the month of August. The mean maximum is 93°-9° and the minimum 75°-4°. Population.—Population made very slow increase under the old conditions of settlement, and even when gold was discovered in 1882 at Kimberley, and five years later at Yalgarn, no great impetus was given to the colony, and at the census of 1881 the population was still under 50,000. The sensational gold finds
at Coolgardie in 1892, however, had a most important influence in drawing population, and in three and a half years the population was doubled: during a portion of this time the rush of miners to the gold-fields was so great as to be reminiscent of the experience of the eastern colonies during the 'fifties. At the end of 1895 the population was 254,770, comprising 150,405 males and 104,284 females. The slowness of the early growth and the more rapid strides of later years will be gathered from the following figures: pop. (1860) 15,227, (1870) 25,084, (1880) 29,019, (1890) 46,290, (1895) 101,238, (1901) 194,899. The chief towns of Western Australia are: Perth—the capital—56,000, Fremantle 23,068, Kalgoorlie 6,766, Boulder 56,3. The number of the population of Coolgardie, for example, was returned in July 1894 as having within its municipal boundaries 12,000 people; in 1905 it had only 3,380.

The births during 1905 numbered 75,828 and the deaths 2,706, the rates per thousand population being respectively 30-30 and 8-83, showing a net increment of 19-47 per 1000. In the period 1861-1865 the birth-rate was 39-07 per 1000. Between 1886 and 1890 it stood at 36-88; then came a rapid decline, and in 1896 was reached the low level of 22-67 per 1000. In 1903 the rate was 30-34 per 1000. The decline in the birth-rates has been a common experience and is due to a reduction in the birth-rate largely due to a large degree in the decline in the proportion of females to males. In 1870 the females numbered 62% of the males, and in 1880 75%, while in 1895 the proportion was only 45%. The proportion of deaths is thus the reverse of the total birth-rate, which in 1897 was 16-99 per 1000, has steadily declined in recent years. The large influx of young unmarried men in the years following the gold-rushes, mining, and railway construction, has resulted in an excess of males to single women, and the marriage-rates increased from 7 per 1000 in the five years 1891-1895 to 10-7 per 1000 in 1897. In 1905 the rate stood at the more normal level of 8-48. Except for a slight influx of population in the three years 1884-1887, due to the gold discoveries at Kimberley, there was very little immigration to Western Australia prior to 1891; in that year, however, there was a considerable troop of population from the eastern colonies, notably from New South Wales and South Australia, and in the seven years that followed the 1891 population of the colony gained nearly 110,000 by immigration alone. In 1898 there was still a large inflow of population, but the outflow also was great, and in 1898 and the following year the two streams balanced one another; but 1900 showed an excess of 6,000, and 1905 of 7,617 gained by immigration.

Western Australia is the most sparsely populated of all the states; only the coastal fringe and the gold-fields show any evidences of settlement, and if the area were divided amongst the population there would be but ten persons to 52 sq. m. The population is almost exclusively of British origin, and only differs from that of the other states in that there is a larger body of Australian-born, who are not natives of the colony itself. The vast majority are members of the Church of England; one-fourth belong to other Protestant denominations, and one-fourth are Roman Catholics.

Administration.—In 1890 Western Australia, up to that time a crown colony administered by a governor, was granted responsible government. The legislative authority is vested in a parliament composed of two Houses—a Legislative Council, whose thirty members are elected for six years, and a Legislative Assembly of fifty members, elected by adult suffrage (men and women). As a portion of the Commonwealth, Western Australia sends fifty two representatives to the federal parliament. In a country so sparsely settled, the municipal government has little scope for operation.

So far forty-four municipalities have been gazetted. Besides the municipalities there are district roads boards, elected by the ratepayers of their respective districts to take charge of the formation, construction and maintenance of the public roads throughout their districts. There were in 1905 ninety-four such boards in existence. Some of the districts are of enormous size: For example, has an area of 14,536 sq. m; Coolgardie North has 7,068 sq. m.; Nullagine has 9,838 sq. m., and the Upper Gascoyne has 136,000 sq. m. Over areas of this kind little effective work can be accomplished, but where the districts are small the administration is much the same as in the municipalities. The receipts from rates of all local districts in 1905 was £104,756, and the grants by the government £80,938, making a total of £185,694.

Education.—Attendance at school is compulsory upon all children over six years and under fourteen years of age. Instruction is imparted only in secular subjects, but the law allows special religious teaching to be given during half an hour each day by clergymen to children of their own denomination. Education is free on account of inability to pay fees, of living more than a mile from school, or of having attended school for more than 400 days. In the year 1905 the average attendance was 13,151, of which 11,315 were on public instruction, the great bulk of which was devoted to primary schools. The number of schools supported by the state in that year was 335, the teachers numbered 888, the children present at school 7,078, and the average attendance 23,703. There were in 1905 99 private schools with 350 teachers and 7353 scholars, the average attendance being 6128. Judged by the number of persons arrested, crime is more prevalent in Western Australia than in any other part of the Commonwealth, and is being combated by some of the best and most enterprising of the Australian population; at the same time many undesirable persons flocked to the state in numbers which would give a high rate of crime.

Finance.—The discovery of gold and the settlement on the gold-fields of a large population, for the most part consumers of durable and necessaries, was the source of Western Australia's prosperity. In 1891 the revenue was £297,670, that is, £10, 15s. per inhabitant; in 1895 it rose to £1,125,041, or £12, 10s. per inhabitant; and in 1905 £1,735,340, or £14, 18s. 6d. per inhabitant. The chief sources of revenue in 1905 were: customs and excise, £1,027,868; other taxation, £231,738; railways, £1,629,956; public lands, £257,291; and the net profits of mines, £164,773, a sum equal to £6, 10s. 4d. per inhabitant, involving an interest charge of £574,492 or £2, 1s. 6d. per inhabitant. The proceeds of the loans were used largely for the purpose of railway extension—the expenditure on this service at the middle of 1906 was £3,618,770; on water supply and sewerage works, £2,982,390; on telegraphs and telephones, £59,308; on harbour and river improvements, £1,182,730; and the purchase of gold-fields, £573,082, on development of agriculture, £597,189.

Defence.—The local defence force of Western Australia in 1905 comprised 57 permanent artillerymen, 772 militia, 580 volunteers, and 464 cadets. The defence of the state is undertaken by the federal government.

Minerals.—Gold-mining is the main industry, and in 1905 16,832 miners were engaged directly or indirectly in the mineral industry. Of these the chief minerals mined were gold, silver, coal, tin and copper. The value of the gold produced in 1905 was £2,204,514, a falling off of £18,572 as compared with 1904. The dividends paid by the gold-mining companies for that year amounted to £2,167,639 as against £2,205,547 in 1904. Up to 1905 the total recorded mineral production of Western Australia amounted to £6,512,490, representing £537,901 of that sum; while £137,793,842 had been paid in dividends.

Western Australia ranks as the largest gold producer of the Australian Colonies. Gold-mining operations which had been going on between Greenough and Mulla Mulla on the Geraldton-Cue railway line were discontinued in 1905, the bore hole, carried to a depth of 1418 ft. having failed to show coal. The tonnage of gold produced in 1905 amounted to 16,206; of tin, £65,840; of silver, £44,278. The value of the coal produced in that year was £55,312.

Indians.—The agricultural possibilities of the state are more restricted than those of the eastern states, as the rainfall in the southern and temperate portion does not extend far from the coast, and the land where the fall is satisfactory is only good over small areas of land. The area cultivated in 1871 was 14,870 acres; in 1891, 64,000 acres; and in 1905, 467,122 acres. The principal crops grown in the year last named were: wheat, 195,071 acres; oats, 15,713 acres; hay, 124,900 acres. The wool on hand was 1,470,076, and the hay crop was 1,122,410 tons per acre. In 1905 the number of sheep depastured was 3,120,763, cattle, 631,825; horses, 97,979. These figures show an increase for the past ten years. The number of sheep has increased considerably in late years. In 1871, 2,000,000 lb. of wool were exported; in 1881, 4,100,000 lb. in
WESTERN AUSTRALIA

1891, 8,800,000 lb; in 1900, 9,514,000 lb; and in 1905, 17,489,402 lb; the value of the latter being $594,872.

Western Australia has very extensive forests of timber, and it has been estimated that the forested surfaces cover more than 20 million acres, of which 8 million acres are jarrah; 1,200,000 acres, karri; 200,000 acres, tuart; 7 million acres, wandoow; and 4 million acres, York gum, yate, sandwood and jam. The principal timber ports is jarrah, karri and wandoo, and the exports being about $656,000 annually. There are 30 saw-mills in operation, employing altogether 2750 hands.

Fisheries are taking an important position, and comprise pearl shell, fishing, salmon, and oyster fishing. The payments from these fisheries have been increasing. In 1899 the exports amounted to $110,667, and in 1904 they were $171,237.

Mandurah, at the mouth of the Murray, and Fremantle have preserving sheds for mullet and snapper. Guano beds are worked to much advantage at the Laccadive Isles. Salt is produced largely at Rottnest Island. Raisins are dried, and the oil of castor trees is expressed. The mulberry tree succeeds well, and sericulture is making progress. Dugong oil is got from Shark's Bay. Honey and wax are becoming valuable exports; from the abundance of flowers the hives can be emptied twice a year. Manna and gums of various kinds are among the resources of the country. Among the wines made are the Risling, Burgundy, Sweetwater, Hock and Fontainbleau.

Commerce.—All the great lines of steamers trading between Australia and Europe make one of the ports a place of call both on the outward and homeward voyages; this makes the shipping very large compared with the population. In 1891 the tonnage entered and cleared equalled 21 tons per head, and in 1905 14.3 tons. The shipping coming from Europe at Fremantle is shown by the following figures.

The trade of Bunbury was shipping 92,281 tons, imports $59,197; Broome, shipping 32,191 tons, imports $48,653; other ports, shipping 18,366 tons, imports $18,730.

The trade has increased very rapidly under the influence of the gold discoveries, as the following figures show:

About 54% of the trade is with Great Britain and 21% with the other Commonwealth states.

Railways.—Western Australia is the only state of Australia in which there is any considerable length of railway lines not owned by the State. The railway line in 1857 was not more than 655 m. were privately owned. The divergence of the policy of Western Australia from that pursued by other states was caused by the inability of the government to construct lines at a time when the extension of the railway was most urgently required in the interests of settlement. Private enterprise was therefore encouraged by liberal grants of land to undertake the work of construction. Changed conditions have modified the state policy in respect of landgrants, and in 1897 the government acquired the Great Southern railway. 243 m. in length, one of the two trunk lines in private hands. The cost of constructing and equipping the state lines open for traffic in 1900 was $4,500,000; the earnings for that year amounted to $6,101,129, the working expenses were $1,256,003, and the net receipts $5,115,126; this represents a return of 36.6% upon the capital.

Posts and Telegraphs.—The postal business has grown enormously since the gold discoveries. In 1905 there were 295 post offices as compared with 86 in 1891. In the latter year the letters despatched and received were 3,300,000 letters; the newspapers and periodicals were 1,000,000; the money orders amounted to $1,634,597. There were sixteen public telephone exchanges and 4877 telephones in use at the end of that year.

Banking.—There are six banks of issue, with 109 branches in various parts of the country. The liabilities of these banks in 1904 averaged $5,205,176, and the assets $6,999,350; the note circulation was $2,548,610; the deposits bearing interest $1,475,610; deposits not bearing interest $3,258,204, making the total deposits $4,733,910. The gold and silver held by the banks, including bullion, was $2,129,304. The savings banks are directly controlled by the government. In 1903 there were 54,873 depositors in these banks with $2,079,763, being an average of $37. 18s. per depositor. In 1891 there were only 3564 depositors and $6,181 at credit.

HISTORY.—The Western and northern coasts of the colony are dotted with numerous islands and reefs. The Great Barrier Reef, stretching for 1,200 miles from Cape York to the northern coast of Queensland, is the longest barrier reef in the world. The reefs are covered with a profusion of coral and marine life. The area of the reef is estimated at 200,000 square miles. The coral is used for building and for the manufacture of coral beads and other decorative objects.

The discovery of the coast may be attributed to Portuguese and Spanish navigators, who were in the seas northward of Australia as early as 1520. The next visitors, nearly a century later, were the Dutch. John Edel explored the coast in 1616, and Captain J. F. M. de Twee in 1628. The "Guilde Zeepaard" in 1629 landed along the south coast of Western Australia. The territory belonging to Nuyt's Land. Tasman made a survey of the north shore in 1644, but did not advance far on the western border. Dampier was off the west coast in 1696 and 1699, naming Shark's Bay. Vancouver entered Cook Sound in 1778. The French, under D'Entrecasteaux, were off Western Australia in 1792; and their commodore Baudin, of the "Géographe" and "Naturaliste," in 1801 and 1802 made important discoveries along the western and north-western shores. Captain Flinders about the same time paid a visit to the Southern and northern lands and beyond the South Australian boundary. Freycinet went thither in 1818. Captain King surveyed the northern waters between 1818 and 1822. The earliest settlement was made from Port Jackson, at the end of 1825. Owing to a fear that the French might occupy King George Sound, Major Lockyer carried thither a party of convicts and soldiers, seventy-five in all, and took formal British possession, though Vancouver had previously done so. Yet the Dutch had long before declared New Holland, which then meant only the western portion of Australia, to be Dutch property. This continued occupation returned to Sydney in 1829. In 1827 Captain Stirling was sent to report upon the Swan river, and his narrative excited such interest in England as to lead to an actual free settlement at the Swan river. Captain Fremantle, R.N., in 1827 took official possession of the whole country. Stirling's account stimulated the emigration ardour of Sir F. Vincent, and Messrs Peel, Macqueen, &c., who formed an association, securing from the British government permission to occupy land in Western Australia proportionate to the capital invested, and the number of emigrants they despatched thither. In this way Mr Peel had a grant of 250,000 acres, and Colonel Latour of 103,000. Captain (afterwards Sir James) Stirling was appointed lieutenant-governor, arriving June 3, 1829. The people were scattered on large grants. The land was poor, and the forests heavy; provisions were at famine prices; and many left for Sydney or Hobart Town. The others struggled on, finding a healthful climate, and a soil favouring fruits and vegetables, whilst their stock grazed in the more open but distant quarters. The overland journey of Eyre from Adelaide to King George Sound in 1830-1834, through a waterless waste, discouraged settlers; but Grey's overland walk in 1838 from Shark's Bay to Perth revealed fine rivers and good land in Victoria district, subsequently occupied by farmers, graziers and miners. The difficulties of the settlers had compelled them to seek help from the British treasury, in the offer to accept convicts. These came in 1859; but transportation ceased in 1868, in consequence of loud protests from the other colonies.

The progressive history of Western Australia may be said to commence in 1870, when its energetic and capable governor, Sir Frederick Weld, began to inaugurate public works on a
large scale. It was still the day of small things, for the colony, though of the enormous extent of 1,000,000 sq. m., was practically unknown, its resources were restricted, and its population scanty. However, a beginning was then made, and the first Loan Bill to raise money for pushing on telegraphs, for surveying lines of projected railways, and above all for starting exploring expeditions, passed the Legislative Council. The colony was fortunate in possessing two brothers of the best practical type of explorer, John and Alexander Forrest. The object of their earliest expeditions was to find more land available for pastoral or agricultural settlement. Vast distances in various directions were covered, and severe hardships, chiefly from want of water, were undergone by these hardy pioneers. Perhaps the most famous of these journeys was that accomplished by Mr. (afterwards Sir) John Forrest between Eucla and Adelaide in 1870.

Some dauntless explorers—notably Mr. Ernest Giles, the Gregories and Mr. Austin—had also contributed to the growing knowledge of the resources of the vast territory, and the state owes and gratefully acknowledges its debt to these stalwart and splendid pioneers. Although, in consequence of the vast amount of gold which had been found in the eastern colonies, principally in Victoria, all these explorations had carried an immense amount of gold, it was not until 1851 that the government geologist reported indications of auriferous country in the Kimberley district, and the first payable gold-field was shortly afterwards "proclaimed" there. Exploring expeditions in every direction were then started both privately and publicly, and prosecuted with great vigour. Within five years gold-fields were proclaimed at Yilgarn, about 200 m. to the east of Perth, and the discovery of patches of rich alluvial gold in the Pilbara district quickly followed, but the rush for the Coolgardie and Kalgoorlie gold-fields did not begin until 1893.

The year 1893 saw the colony grow rapidly in population, and the desire for the extension of responsible government. Two years before, a practically unanimous vote of the Legislative Council had affirmed the principle of autonomy, and the general election in the following year showed more plainly the desire of the people of Western Australia for the self-government which had enabled the eastern colonies to control their own affairs successfully for thirty years. The new Legislative Council of 1894 therefore drafted a Constitution Bill, which after some discussion was forwarded to Lord Knutsford, the Secretary of State for the Colonies. This Bill was rejected before the Imperial Parliament, and another Bill was then rejected by that assembly, chiefly owing to the misunderstanding of vital questions, such as the control of crown lands, the scantiness of the scattered population, and other less important details. However, the governor of that day, Sir Frederick Napier Broome, K.C.M.G., having satisfied himself that the constitutional change was necessary not only for the immediate needs of the rapidly growing colony, but in view of the larger question of Imperial Federation, supported the demands of the Legislature in every possible way. A clear and able statement of the colonists' case, which appeared above his signature in The Times in the summer of that year, helped to bring about a better understanding of the subject; and a slightly modified Constitution Bill having been passed by the new Legislative Council, the governor and two members of the Legislature (Sir T. C. Campbell and Mr. S. H. Parker, Q.C.) were selected to proceed to England as delegates to explain and urge the wishes of the colonists upon the Imperial Parliament. A select committee, with Baron de Worms as chairman, was appointed, and the matter was carefully considered, with the satisfactory result that the Bill enabling the Queen to grant a constitution to Western Australia passed its third reading in the House of Commons on 4th July, and received the royal assent on 5th August 1890.

Since then the colony has made great progress. Sir John Forrest, who was for ten years its Premier, brought to his arduous task not only administrative ability of a very high order, but a thorough and intimate knowledge of the needs and resources of the vast colony over so much of which he had travelled.

For a long time the advantages of Federation were not so apparent to the people of Western Australia as to those of the eastern colonies, and although Sir John Forrest consistently and patiently laboured at every opportunity to explain the principles of the Bill framed by the committee of the Imperial Parliament, and approved by the Imperial Government, to Sir Alfred Holt, Lord Carnarvon, the then Secretary of State for the Colonies, and by the late Sir Charles Wordsworth, the Governor of New South Wales, there was much misapprehension, chiefly to the questions of tariff and free trade, and to the loss of the individual control of such sources of revenue as customs, postal and telegraphic services. Of the financial arrangements, for trade, it was urged in favour of Federation, but that was hardly enough to counterbalance the fears of the local producer, who had become accustomed to a protective tariff. The gold-fields expressed a desire to remain more or less independent of the colony, and although a numerous deputation of persons, including the Prime Minister, the Chief Justice, the Clerk of the Legislative Council, and the Secretary of the Colonies, was received by the Lord Lieutenant, it received scant encouragement. It was regarded in the light of a party move, and did not prove successful. Still there was great hesitation on the part of many of the colonists of Western Australia to join the Commonwealth without receiving a pledge for the retention of their own customs dues for five years, and early in 1900 Sir John Forrest made a personal attempt to obtain this concession from the sister governments. He was, however, unsuccessful, as was Mr. S. H. Parker, Q.C., who in the same year accompanied the delegates from the eastern colonies to London, and endeavoured to obtain the insertion in the Enabling Bill of certain recommendations of the Imperial Committee in Perth. Yet as a whole the people of Western Australia were loyal to the Federal cause, and therefore it was considered best to submit the Bill to a referendum of the electors, when a majority of over 25,000 votes decisive in the Northern Federation was obtained. The people of Western Australia should have the right to enact their own tariff as against the sister states for the desired five years, decreasing annually at the rate of one-fifth of the amount of the original duty until the whole was dropped.

(M. A. B.)

WESTFIELD, a township of Hampden county, Massachusetts, U.S.A., on the Westfield river, about 10 m. W. of Springfield. Pop. (1890) 9,605; (1900) 12,310 (2441 being foreign-born); (1905, state census) 13,611; (1910) 16,044. It is served by the New York, New Haven & Hartford and the Boston & Albany railways, and is connected with Springfield, Holyoke and Huntington by electric lines. The township lies in and on either side of a deep alluvial valley, 6-7 m. long from east to west and 2-3 m. wide, and includes the large village of Westfield, which was settled in 1720, and the township of Whist Whip Conduit. Although it was the largest in the world; this industry was begun here early in the 19th century. Other important manufactures are foundry and machine-shop products, paper, thread and bicycles. In 1905 the value of the product factory was $5,818,130, an increase of 31 % since 1900. A trading port, known by the Indian name Woronoco (or Woronoko), was established here about 1640. In 1669 the township, which had previously been part of Springfield, was erected under its present name—it was then the westernmost township in Massachusetts. Land was added to it in 1713, and part was taken from it to form Southfield (1770) and Northfield, (1773), to Montgomery (1775) and Russell (1792), and to West Springfield (1802).

WESTGATE-ON-SEA, a watering-place in the Isle of Thanet parliamentary division of Kent, England, 2 m. W. by S. of Margate on the South-Eastern & Chatham railway. Pop. (1901) 2738. It is of modern growth and noted for its healthy climate. Facing the sea there are gardens and promenades over 1 m. in length, and there is a marine drive along the top of the cliffs. There are also golf links and other appointments of a popular resort. BIRCHINGTON, immediately to the west (pop. 2218), is also a growing resort. The church of All Saints is
WEST HAM—WEST INDIES

Perpendicular, with an Early English tower, and contains some interesting monuments.

WEST HAM, a municipal, county, and parliamentary borough of Essex, England, forming an eastward suburb of London. Pop. (1891) 204,003, (1900) 267,358. The parish stretches north and south from Wanstead and Leyton to the Thames, and east and west from East Ham to the river Lee. It is divided into four wards—Church Street, Stratford-Langthorne, Plaistow and Upton. The church of All Saints has a good Perpendicular tower, but the remainder is extensively restored. There are a number of old monuments. In the restoration of 1866 some early mural painting was discovered in the church, and carefully woven; remaining above the nave.

There are several modern churches, and a Franciscan monastery and school (St Bonaventure’s). West Ham Park (80 acres) occupies the site of Ham House and park, for many years the residence of Samuel Gurney, the banker and philanthropist. The place was purchased for £25,000, and vested in the corporation of London for the use of the public. Of this amount the Gurney family contributed £10,000 and the corporation the same sum, the remaining £10,000 being collected from the inhabitants of West Ham by Mr. Gurney. The park was opened in 1874. Mrs Elizabeth Fry lived in a house in Upton Lane, on the confines of her brother’s park. In 1762 the number of houses in West Ham parish was stated to be 700, of which “455 are mansions and 245 cottages.” Now few large houses remain, but the smaller houses have greatly increased. There are numerous chemical and other manufactures which have been removed from London itself; and the large population can also be traced in part to the foundation of the Victoria and Albert docks at Plaistow. Included within the borough are the extensive railway works of the Great Eastern railway at Stratford. This industrial centre is continued eastward in the urban district of East Ham (pop. 66,018), where the old village church of St Mary Magdalene retains Norman portions. West Ham is governed by a mayor, 12 aldermen and 36 councillors. Area 4,683 acres.

At the time of the Conquest West Ham belonged to Aelastan and Leurted, two freemen, and at Domescadal to Ralph Geron and Ralph Peverel. West Ham village was included in the part which descended to the Gernons, who took the name of Montfichet. The manor of West Ham was settled upon Stratford-Upon-Abbey, founded by William de Montfichet, in 1254 for monks of the Cistercian order. The abbey stood in the marshes, on a branch of the Lea known as the Abbey Creek, about 1½ m. south of Stratford Broadway. West Ham received the grant of a market and annual fair in 1253. The lordship was given to the abbey of Stratford, and, passing to the crown at the dissolution, formed part of the dowry of Catherine of Portugal, and was therefore called the Queen’s Manor. In 1583 the urban sanitary district was erected into a parliamentary borough, returning two members for the northern and southern divisions respectively. It was incorporated in 1886.

WEST HAVEN, a borough of Orange township, New Haven county, Connecticut, U.S.A., on New Haven Harbor and separated from New Haven by the West river. Pop. (1900) 52,477 (833 foreign-born); (1910) 83,453. West Haven is served by the New York, New Haven, & Hartford railway. It is mainly a residential suburb of New Haven. There is a public park, and Savin Rock, rising from Long Island Sound, is a summer resort. West Haven was set apart from New Haven in 1822 and was united with North Milford to form the township of Orange; it was incorporated as a borough in 1873.

WEST HOBOKEN, a town of Hudson county, New Jersey, U.S.A., in the N.E. part of the state, adjoining Hoboken and Jersey City. Pop. (1890) 11,665; (1900) 23,004, of whom 9119 were foreign-born; (1910, census) 25,403. For transportation facilities the town depends upon the railways serving Hoboken and Jersey City. West Hoboken lies about 2½ m. W. of the Hudson river, occupies a pleasant site somewhat higher than that of its neighbouring municipalities, and commands a fine view of the surrounding country. Among the prominent buildings are a Carnegie library, St Michael’s Monastery (containing a theological school), a Dominican Convent, and several fine churches; and there are two Roman Catholic orphanages. The town is an important centre for the manufacture of silk and silk goods; in 1905 the value of these products was $4,211,018. West Hoboken was created a separate township in 1861, from a part of the township of North Bergen, and in 1884 was incorporated as a town.

WESTHOUNTON, an urban district in the Westhoughton parliamentary division of Lancashire, England, 5 m. W.S.W. of Bolton on the Lancashire and Yorkshire railway. Pop. (1900) 14,317. There are coal mines in the neighbourhood, and the town manufactures coal and cement. Westhoughton before the time of Richard II. was a manor belonging to the abbey of Cockersand. It was confiscated at the Reformation, and since then has been vested in the crown. The army of Prince Rupert assembled on Westhoughton moor before the attack on Bolton.

WEST INDIES, THE, sometimes called the Antilles (q.v.), an archipelago stretching in the shape of a rude arc or parabola from Florida in North America and Yucatan in Central America to Venezuela in South America, and enclosing the Caribbean Sea. The islands are divided into two large groups, the Greater Antilles (Cuba, Jamaica, Haiti and Porto Rico), and the Lesser Antilles (comprising the remainder). The Lesser Antilles are again divided into the Windward Islands and Leeward Islands. Geographically, the Leeward Islands are those part of St Lucia and the Windward, St Lucia and those to the south of it; but for administrative purposes the British islands in the Lesser Antilles are grouped as is shown in the table given later.

Geology.—The West Indies are the remnants of a submerged mountain chain, the continuation of which towards the west must be sought in the mountains of Honduras. In Haiti the chain divides, one branch passing through Jamaica and the other through Cuba, the Cayman Islands and the Mysterious Bank. In Das Antilis der Erde, E. Suess divides the Antilles into three zones: (1) the first or interior zone, which is confined to the Lesser Antilles, is entirely of volcanic origin and contains many recent volcanic cones. In it the island of St Lucia, the Archipelago of Barbadoes, and St Kitts to Grenada and the Grenadines. The western part of the deep-cleft island Guadeloupe belongs to this zone. (2) The second zone consists chiefly of Cretaceous and early Tertiary rocks. In the western part of the archipelago they are broad, including the whole of the island of Barbadoes, but in the east it is restricted to a narrow belt which comprises the Virgin Islands (except Anegada), Anguilla, St Bartholomew, Antigua, the eastern part of Guadeloupe and part of Barbadoes. (3) The third and outermost zone is formed of Miocene and later beds, and the islands which compose it are flat and low. Like the second zone it is broad in the west and narrow in the east. It includes the Bahamas, Anegada, Sombrero, Barbuda and part of Barbadoes. Geologically, Florida and the plain of Yucatan may be looked upon as belonging to this zone. Neither Trinidad nor the islands off the Venezuelan coast can be said to belong to any of these three zones. Geologically they are a part of the mainland itself. They consist of gneisses and schists, supposed to be Archeaean, eruptive rocks, Cretaceous, Tertiary and Quaternary deposits; and the strike of the older rocks varies from E. & W. to W.S.W. & E.N.E. The deposits are much more nearly allied to the Greater Antilles and to Central America than they are to the Lesser Antilles; and there is accordingly some reason to believe that the arc formed by the West Indian Islands is really continuous with that to the south. In the Greater Antilles recognized by Suess are fairly clearly defined, the geological history of the Lesser Antilles, with which must be included the Virgin Islands, can only be conjectured. In this group the oldest beds composed of Cretaceous rocks, with occasional beds of limestone and occasional Cretaceous fossils. These are overlaid by sediments of terrigenous origin, and the whole series was folded before the deposition of the next succeeding strata. The nature of these Cretaceous deposits clearly indicates the neighbourhood of an extensive area of land;
but during the succeeding Eocene period and the early part of the Oligocene, a profound subsidence led to the deposition of the Globigerina chalks and white Radiolarian earths of Jamaica, Cuba and Haiti, which to the present day appear to have been almost completely submerged, and the similar deposits of Barbados and Trinidad point to a similar subsidence beyond the Windward Islands. In the middle of the Oligocene period a mighty upheaval, according to the theory of continental drift, has raised the Antilles far above their present level, and united the islands with one another, and perhaps with Florida. A subsequent subsidence, and a series of minor oscillations finally resulted in the production of the present topography.

The geology of the Lesser Antilles is somewhat different. In some of the islands there are old volcanic tuffs which may possibly be the primary rocks, the surface of which, however, has been so altered, as to here continue throughout the Tertiary period and even down to the present day. Another important difference is that except in Trinidad and Barbados, which do not properly belong to the Caribbean region, the surface of the Lesser Antilles has been covered by the sea. Antilles and there is no evidence that the area ever sank to abysmal depths.

In the foregoing account the chronology of R. T. Hill has been followed; but there is still considerable difference of opinion as to the ages and correlation of the various Tertiary deposits and consequently as to the dates of the great depression and elevation. It is quite possible that the present faunal province and the Antilles in the Pliocene and Pleistocene periods. Moreover, on the evidence of submerged valleys, he concludes that practically the whole of the Caribbean Sea, and perhaps the adjacent sea, is the shallow eastern bay of the West Indian bridge, between North and South America.¹

The mineral wealth of the islands is not remarkable. Gold, silver, and iron ore of some value: lumber, oil, coal, mercury, arsenic, antimony, manganese, and rock salt either have been or are worked. Asphalt is worked to considerable advantage among the pitch lakes of Trinidad. Opal and chalcedony are the principal precious stones.

Climate.—As in most tropical countries where considerable heights are met with—and here over 15,500 sq. m. lie at an elevation of more than 500 ft. above sea-level—the average of the hottest month (in so far as heat and cold are concerned) varies at different altitudes, and on the higher parts of many of the islands a marked degree of coolness may generally be found. With the exception of parts of the Bahamas, all the islands lie between the Tropic of Cancer (23° 27′ and 82° 5′. The extreme heat, however, is greatly tempered by the sea breezes, and by long, cool, refreshing nights. Frost is occasionally formed in the cold season when half falls, but snow is unknown. The seasons may be divided as follows. The short wet season, or spring, begins in April and lasts from two to six weeks, and is succeeded by the short dry season, when the thermometer remains almost stationary at about 80° F. In July the heat increases to an extent well nigh unbearable. No change occurs till after a period varying from the end of July to the beginning of October, when the great rainfall of the year begins, accompanied by tremendous winds and heavy rain showers. This season is known as the "hurricane months." The annual rainfall averages 63 in. These storms arise in the Atlantic and towards the east. For a day or two the hurricane, a whirlwind, including in its limited path two points towards the north, the polar tendency becoming gradually more marked as the distance from the equator increases. When the hurricanes reach latitude 25° N., they curve to the northeast, and often break off round 30° N. and at the northern portion of the Gulf of Mexico, where after which they follow the coast line of North America. Their rate of speed varies considerably, but may be said to average 300 m. per day among the islands. The usual signs of the approach of the hurricane are an ugly and threatening appearance of the weather, sharp and frequent puffs of wind, increasing in force with each blast, accompanied with heavy rain, and the water coming from the direction of the approaching storm. December marks the beginning of the long dry season, which, accompanied by fresh winds and occasional hail showers, lasts till April. The average temperature of the islands is generally uniform throughout the year, about 80° F, in the rear of the glycine, and about 82° in the afternoon. The maximum is 87°, and the minimum 75°.

Flora.—The flora of the islands is of great variety and richness, as considerable efforts of the people of the islands are very flourishing in a wild state or under cultivation; grain, vegetables, and fruits, generally common in cool climates, may be seen growing in profusion in the islands which border the Atlantic, where the climate is one of the driest in the world, and which border the Atlantic, where the climate is one of the driest in the world.

The following list of the West Indian Islands gives their area and population. Notwithstanding the numbers and wide-spreadings, produce the most valuable woods and delicious fruits. Palms are in great variety, and there are several species of gum-producing trees. Some locust trees have been estimated to have attained an age of 4000 years, and are as thick as a man can encircle, and of immense height and bulk. Piptadenia, on account of its almost imperishable character when in the ground, is used as a material for house-building. Xanthoxylum, the admired and valuable satin-wood of China, is plentiful. Sapium, a red heartwood, has a market on account of its toughness; and fruit-woods yield a useful oil and afford reliable timber; and tree ferns of various species are common. Fimihito is plentiful.

Hymenoclonium striatum covers many of the plains, and affords food for cattle.

Fauna.—The fauna of the region is Neotropical, belonging to that region which includes South and part of Central America, although great numbers of birds from the North-American portion of the Holarctic realm migrate to the islands. The resident birds, however, are mostly Neotropical, and are divided into two main sub-groups, the native and the non-migrating. These are as, in most island groups, rare. The agouti abounds, and wild pigs, and dogs are sufficiently numerous to afford good sport to the hunter, as well as smaller game, in the shape of armadillos, muskrats, and raccoons. The non-migrating birds include trogons, sugar-birds, chattering-ants, and many parrots and humming birds. Waterfowl and various kinds of pigeons are in abundance. Reptiles are various, both the boa and adder are innocuous, while lizards, scorpions, tarantulas and centipedes are everywhere. Insects are in great numbers, and are often annoying. Among domestic animals mules are largely reared, and where the country affords suitable pasture and forage cattle-breeding is practised.

Area and Population.—The following list of the West Indian islands gives their area and population.
operations of educational institutions, and of large numbers of missionaries of various religious denominations, the percentage of illegitimate births among the population of the British West Indian islands remains very high—in Barbados about 54; in Jamaica, 63; in Trinidad, 59% of the general births; and 79% of the East Indian.

The population of the West Indies represents many original stocks, the descendants of which have developed variations of habits and customs in their New World environment. They may be divided into six main classes: (1) Europeans—immigrants (British, French, Spanish and in a lesser degree Dutch, Danish and German) and West Indian born; (2) African negroes—imported (excluding quantity) and West Indian born; (3) a mixture of Europeans and Africans; (4) coolies from India—imported and West Indian born; (5) Chinese; (6) aboriginal Indians of more or less pure descent. Of these, the people of pure African blood are in a large majority, the "coloured" race of mixed European and African blood being next in numerical importance. Under British influence the negroes of the West Indies have become British in thought and habit; and it would seem that the stimulating influence of European direction and encouragement is absolutely necessary for the future development and prosperity of the islands. In Dominica and Haiti the negroes are left to drift along, while the French and Danish islands show no great sign of progress.

British Colonies, Government, &c.—The British West India colonies are either crown colonies—that is to say, their government is absolutely under the control of the British Colonial Office, the official members of their councils predominating, and the unofficial members being nominated by the crown, as in the Windward and Leeward Islands—or they have a measure of representative government, as in the Bahamas, Barbados and Jamaica, in which all or part of the legislatures are elected and are more or less independent of crown control. The laws of the various colonies are English, with local statutes to meet local needs. The governors and high officials are appointed by the crown; other officials are appointed by the governor. Each governor acts under the advice of a privy council. In matters of detail the colonies present a variety of forms of government (for which see the separate articles). Federation has been widely discussed and is held desirable by many, but in view of the insular character of the colonies, the considerable distances separating some of them, and in many instances the lack of common interests (apart from certain broad issues), the project appears to be far from realization.

The only fortified places in the British West Indies are Jamaica, Barbados and St Lucia—all of importance as coaling stations. In many of the islands there are local volunteer forces. The police forces of the colonies are in the main modelled on the Irish constabulary, supplemented by rural constabulary. The force is usually officered by Europeans.

Economic Conditions.—The West Indian colonies have suffered from periods of severe economic depression, though from the early years of the 20th century there has been good evidence of recovery and development. An obvious reason for temporary depression is the liability of the islands to earthquakes and hurricanes, in addition to eruptions in the volcanic islands, such as those in St Vincent and Martinique in 1902. For example, the great earthquake of January 1907 in Jamaica may be recalled, and hurricanes caused serious damage in Jamaica in August 1903 and November 1909, and in the Bahamas in September and October 1908. A treasury fund has been established in Jamaica as a provision against the effects of such disasters and it has been stated that the expenses (apart from certain incidental costs) which accompanies these storms is of great ultimate benefit to the soil. The British West Indian colonies do not offer opportunities for ordinary labouring immigrants. Barbados is the only island where the land is entirely settled. But the settlement, planting and development of lands elsewhere involve a considerable amount of capital, and manual labour is provided by the natives or East Indian coolies. Attempts to settle European labourers have been unsuccessful. The West Indian negro, as a labouring class, has frequently been condemned as averse from regular work, apathetic in regard to both his own and his colony's affairs, immoral and dishonest. In so far as these shortcomings exist, they are due to the tendencies inherited from the period of slavery, to the ease with which a bare livelihood may be obtained, and to other such causes. But for the most part the negroes appreciate their advantages under British government and are quick to assimilate British customs and ideas. Advances in the system of peasant proprietorship have brought beneficial results. The drafting of large numbers of labourers from the West Indies to the Panama Canal, though causing a shortage of labour and involving legislation in some of the islands, exercised a moral effect on the natives by enlarging their horizon.

The growth of general prosperity in the British West Indies is attributed partly to the revival of the sugar industry, to the development of the fruit trade; to the increase in the cultivation of cocoa and cotton; to the volume of tourist travel, which swells year by year; and to such local developments as the "boom" in Trinidad oil. It was pointed out in the Report of the Royal Commission on Trade Relations between Canada and the West Indies (Cd. 5366, London, 1910) that "the geographical position of the West Indian Colonies must always tend to throw them under the influence of the fiscal system either of the United States or of the Dominion of Canada. Attempts have been made from time to time to obtain for these Colonies special advantages in the markets of the United States. . . . The Colonial policy of the United States has now finally stopped in that direction," and the connexion with the Dominion has therefore become of paramount importance. The Dominion government admitted the West Indies to the British preferential tariff (25% under existing duties) in 1898. The preference was raised to 32½ in 1900. In 1905 the duties imposed on bounty-fed beef sugar in the United States, which had opened the market there to West Indian sugar, were abolished, and a surtax (since removed) was placed on German imports into Canada. Both acts enhanced the value of the Canadian market to the West Indies, while that of the American sugar market was further reduced when in 1901 sugar from Porto Rico began to be admitted thereto free of duty, and when special terms were extended to sugar from the Philippine Islands and Cuba in 1902. The Canadian connexion was thus largely instrumental in saving the sugar industry in the West Indies from severe depression, if not from the actual extinction foreseen by a Royal Commission in 1897. This commission pointed out, in particular, the danger which threatened those colonies where sugar provided practically the sole industrial and commercial interest. On a recommendation of this commission the Imperial Department of Agriculture was established in 1898, its cost being met from imperial funds. It is under a commissioner with headquarters at Barbados. Its functions are to maintain and supervise botanical and experimental stations, to establish agricultural schools, arrange agricultural teaching in other schools, create scholarships, and issue publications. The department has been largely instrumental in establishing new industries and thus relieving many islands from dependence on the sugar industry alone.

The negotiations for commercial relations between the West Indies and Canada began in 1866; in 1872 proposals for steamship subsidies were accepted. The Commission of 1900 recommended that the governments should continue to subsidize Canadian steamers, and also suggested various improvements. In 1901 a line of subsidized steamers had been begun between Jamaica and England, but this contract expired, and the mail contract was determined in 1910, and recommendations were put forward for a steamship service between Canadian and West Indian ports with improvements additional to those recommended by the Commission. It may be added that the

1 In The Times of May 24, 1910, where, in an imperial supplement, a number of articles on the West Indian colonies appear.
Commission also made recommendations for the reduction of the high cable rates between the West Indies and the United Kingdom.

Besides sugar, the principal products of the islands are cocoa, fruits and cotton. Cotton-growing reached importance in a very short time owing largely to the efforts of the Imperial Government of India to develop the cotton industry. West Indian cotton was first grown only in 1903, and in that island and elsewhere (Antigua, St Kitts, Montserrat) good crops are now obtained. Grenada is almost entirely, and Trinidad, Dominica and Barbados largely, clothed with upland forest. The spice trade is of growing importance, and there is a demand for bottled fruit in Canada and elsewhere. The variety of fruits grown is great; the bananas and oranges of Jamaica, the pine-apples of the Bahamas and the local pine-apples of the Bahamas may be mentioned as characteristic.

It must be borne in mind, however, that the islands as a whole cannot be said to possess a community of commercial interests. Even the industries already indicated are by no means equally distributed throughout the islands; moreover there are certain local industries of high importance, such as the manufacture of rum in Jamaica, the production of oil from the oilfields (the development of which was first seriously undertaken about 1905) in Trinidad, and the production of arrowroot in St Vincent. Sponges are an important product of the Bahamas, and salt of the Turks Islands, rubber plantations have been successfully exploited in several islands, such as Trinidad, Dominica and St Lucia. (See further articles on the various islands.)

History.—In all the British colonies there is full religious toleration. The Church of England Province of the West Indies is divided into the following bishoprics: Jamaica, Nassau (i.e. Bahamas), Trinidad, St Vincent, Martinique, Guadeloupe, Barbados, Windward Islands, (British) Guiana. With the exception of Barbados and British Guiana, the Church of England is disestablished, disendowment taking place gradually, the churches thus becoming self-supporting. In Barbados the Church is both established and endowed. In the Bahamas and Jamaica disendowment is gradually taking place; in Trinidad and British Guiana the Church of England receives endowment concurrently with other religious bodies. The Windward Islands, Leeward Islands, British Guiana and British Honduras are totally disendowed. In all the islands, except Trinidad, St Lucia, Grenada and Dominica, the Church of England, though the Church of Rome, being the only Church with the exception of other bodies, is the most numerous of any denomination. There are Roman Catholic bishops at Port-of-Spain (Trinidad), Roseau (Dominica—for the Leeward Islands), Jamaica, British Guiana and Barbados (resident at Georgetown), British Honduras, Guadeloupe, Martinique, Haiti (archbishop and four bishops), Santo Domingo (archbishop), Cuba (archbishop and bishop), Porto Rico and Curagao. Other religious denominations working actively in the West Indies are the Baptists, Wesleyans, Presbyterians, Congregationalists and Moravians.

The archipelago received the name of the West Indies from Columbus, who hoped that, through the islands, he had found a new route to India. The name of Antilles was derived from the fact that Columbus, on his arrival here, was supposed to have reached the fabled land of Antilia. Columbus first landed on San Salvador, generally identified with Watling Island of the Bahamas, and several voyages to this new land were made in rapid succession by the great discoverer, resulting in the finding of most of the larger islands, and a more intimate knowledge of those already known. The importance of its latest possession was at once recognized by the court of Spain, and, as a first move towards turning the West Indies to profitable account, numbers of the natives, for the most part a harmless and gentle people, were shipped overseas and sold into slavery, others being employed in forced labour in the mines which the Spaniards had opened throughout the archipelago, and from which large returns were expected. Thus early in its history began that traffic in humanity with which the West India plantations are so widely associated, and which endured for so long a time. Government being wrongfully inflicted upon them, the aborigines at last took arms against their masters, but with the result which might have been expected—their almost utter extinction. Many of the survivors sought release from their sufferings in suicide, and numbers of others perished in the mines, so that the native race soon almost ceased to exist. Spain was not long allowed to retain an undisputed hold upon the islands: British and Dutch seamen soon sought the new region, accounts concerning the fabulous wealth and treasure of which stirred all Europe, and a desultory warfare began to be waged amongst the various voyagers who flocked to this El Dorado, in consequence of which the Spaniards found themselves gradually but surely forced from many of their vantage grounds, and compelled very materially to reduce the area over which they had held unchecked sway.

The first care of the English settlers was to find out the real agricultural capabilities of the islands, and they diligently set about planting tobacco, cotton and indigo. A French West India Company was incorporated in 1625, and a settlement established on the island of St Christopher, where a small English colony was already engaged in clearing and cultivating the ground; these were driven out by the Spaniards in 1627, but only to return and again settle the West Indies. About this time the celebrated buccaneers, Dutch smugglers, and British and French pirates began to infest the neighbouring seas, doing much damage to legitimate traders, and causing commerce to be carried on only under force of arms, and with much difficulty and danger. Indeed, it was not till the beginning of the 18th century—some time after Spain had, in 1670, given up her claim to the exclusive possession of the archipelago—that these rovers were rendered comparatively harmless; and piracy yet lingered off the coasts down to the early years of the 19th century. In 1640 sugar-cane began to be systematically cultivated, and the prosperity of the West Indies began; it was not from the gold and precious stones, to which the Spaniards had looked for wealth and power, but from the cane that the fortunes of the West Indies were to spring. The successful propagation of this plant drew to the islands crowds of adventurers, many of them men of considerable wealth. The West Indies were for many years used by the English government as penal settlements, the prisoners working on the plantations as slaves. In 1653 a British force made an unsuccessful attack on Haiti, but a sudden descent on Jamaica was more fortunate in its result, and that rich and beautiful island has since been the object of great rivalry. The Portuguese were the first to import negroes as slaves, and their example was followed by other nations having West-Indian colonies, the traffic existing for about 300 years. In 1650 a division of the islands was arranged between England and France, the remaining aborigines being driven to specified localities, but this treaty did not produce the benefits expected from it, and as wars raged in Europe the islands (see separate articles) frequently changed hands.

his bust of Sir William Chambers. In 1809 he was elected an associate, and in 1811 a full member of the Royal Academy, his diploma work being a "Ganymede" in high relief; in 1827 he was appointed to succeed Flaxman as Royal Academy professor of sculpture, and in 1837 he was knighted. A very large number of important public monuments were executed by him, including many portrait statues; but little can be said in praise of such works as the statue on the duke of York's column (1833), the portrait of Fox in Bloomsbury Square, or that of the duke of Bedford in Russell Square. Much admiration was expressed at the time for Westmacott's monuments to Collingwood and Sir Ralph Abercromby in St Paul's Cathedral, and of that of Mrs Warren in Westminster Abbey; but subjects like these were far less congenial to him than sculpture of a more classical type, such as the pedimental figures representing the progress of civilization over the portico of the British Museum, completed in 1847, and his colossal nude statue of Achilles in bronze, copied from the original on Monte Cavallo in Rome, and reared in 1822 by the ladies of England in Hyde Park as a compliment to the duke of Wellington. He died on the 1st of September 1856.

WESTMEATH, EARL OF, a title held in the Irish family of Nugent since 1622. In 1649 it was bestowed on Sir William Nugent (d. 1652) on the accession of James II. His grandson, Richard, 4th earl (d. 1686), married Catherine, daughter of John Fitzjoh. The barony, however, is considered to date from the time of Sir William Nugent and not from that of Sir Gilbert, 1389 being generally regarded as the date of its creation.

Sir William Nugent, who is generally called the 1st, but sometimes the 4th, baronet, was succeeded by his son, Sir Richard (d. c. 1465) as 2nd baronet. In 1444 and 1449 Sir Richard was lord deputy of Ireland. His grandson, Richard, the 4th baronet (d. c. 1538), was summoned to the Irish parliament in 1486. During his whole life he was loyal to the English king, and both before and after the years 1527 and 1528 when he was lord deputy, he took a vigorous part in the warfare against the Irish rebels. Among his descendants was Robert Nugent, Earl Nugent (g.v.). Richard's grandson, Christopher, the 6th baronet (c. 1544–1602), also served England well, but when he died in 1602 he left the barony of Queen Elizabeth, and he was several times imprisoned, being in the intervals employed in Ireland. He was a prisoner in Dublin Castle when he died. Delvin wrote A Primer of the Irish Language, compiled at the request and for the use of Queen Elizabeth.

His son, Richard, the 7th baronet (1583–1642), took part in 1606 in a plot against the English government and was imprisoned, but he soon escaped from captivity and secured a pardon from James I. In 1621 he was created earl of Westmeath. Having refused in 1641 to join the Irish rebellion, he was attacked by a party of rebels and was so seriously injured that he died shortly afterwards. His grandson, Richard, the 2nd earl (d. 1684), served Charles II. against Cromwell in Ireland and afterwards raised some troops for service in Spain. His grandson Thomas, the 4th earl (1650–1725), served James II. in Ireland. Thomas's brother, John, the 5th earl (1672–1754), left Ireland after the final defeat of James II. and took service in France. He fought against England at the battles of Ramillies, Oudenarde and Malplaquet and remained on active service until 1748. He died in Brabant on the 3rd of July 1754. His son George Frederick, the 7th earl (1776–1814), a member of the Irish House of Commons before 1792, was succeeded by his son George Thomas John (1785–1871), who was created marquess of Westmeath in 1832 and who was an Irish representative peer from 1831 to 1871. He died without legitimate sons on the 5th of May 1871, when the marquessate became extinct.

The earldom of Westmeath now passed to a distant cousin, Anthony Francis Nugent (1805–1879), a descendant of Thomas Nugent (d. 1715) of Pullen, Great Knocklayde, a son of the 2nd earl. Thomas was the chief justice of Ireland from 1651 to 1653 and was outlawed by the government of William III. In 1669 he was created James II. baron of Riverston, but the validity of this title has never been admitted. In 1838 his descendant, Anthony Francis (b. 1870), became the 11th earl.

Cadets of the Nugent family were Nicholas Nugent (d. 1782), chief justice of the common bench in Ireland, who was hanged for treason on the 6th of April 1782; William Nugent (d. 1785), an Irish rebel during the reign of Elizabeth; Sir George Nugent, 2nd baronet (d. 1757–1840), who, after serving with the army in America and in the Netherlands, returned in 1711 to 1813 and became a field-marshall in 1849; and Sir Charles Edmund Nugent (c. 1759–1844), an admiral of the fleet. More famous perhaps was Laval, Count Nugent (1777–1862), who rose to the rank of field-marshall in the Austrian army and was made a prince of the empire. His long and honourable military career began in 1793 and sixty-six years later he was present at the battle of Solferino. His most distinguished services to Austria were during the war with France in 1813 and 1814, and he served in the campaign in Russia in 1812.

See D'Alton, Pedigree of the Nugent Family; and Historical Sketch of the Nugent Family, printed by J. C. Lyons (1835).

WESTMEATH, a county of Ireland in the province of Leinster, bounded N.W. by Longford, N. by Cavan, N.E. and E. by Meath, S. by King's county, and W. by Roscommon. The area is 454,104 acres, or about 709 sq. m. The Shannon forms the western boundary. The average height of the surface of the county is over 250 ft. above sea-level. The highest summits are Knocklayde (795 ft.), Hill of Ben (710 ft.) and Knockavon (707 ft.). A large surface is occupied by bog. A special feature of Westmeath is the number of large loughs, which have a combined area of nearly 17,000 acres. In the north, on the borders of Cavan, is Lough Sheelin, with a length of 5 m., and an average breadth of between 2 and 3 m., and adjoining it is the smaller Lough Kinale. In the centre of the county there is a group of large loughs, of which Lough Dervenagh is 6 m. long by 3 broad at its widest part. To the north of it are Loughs Lene, Glore, Bawn and others, and to the south Loughs Iron and Owal. Further south is Lough Ennell or Belvidere, and in the south-west Lough Rea, a great expanse of water. The river Shannon, forming part of the boundary with Roscommon. The river Inny, which rises in Co. Cavan, enters Westmeath from Lough Sheelin, and, forming for parts of its course the boundary with Longford, falls into Lough Ree. The Inny has as one of its tributaries the Glore, flowing from Lough Lene through Lough Glore, a considerable part of its course being underground. From Lough Lene the Dale also flows southwards to the Boyne and so to the Irish Sea, and thus this lake sends its waters to the opposite shores of the island. The Brosna flows from Lough Ennell southwards by King's county's boundary to the Shannon. The Westmeath loughs have a peculiar fame among anglers for the excellence of their trout-fishing.

Westmeath is essentially a county of the great Carboniferous Limestone plain, with numerous lakes occupying the hollows. Two or three little inlets of Old Red Sandstone, as at Killucan and Moate, form distinct hills, about 600 ft. in height. The hill near Killucan, a core of Silurian strata appears within the sandstone dome. A considerable system of eskers, notably north of Tullamore, divides the surface of the county.

The soil is generally a rich loam of great depth resting on limestone, and is well adapted both for tillage and pasturage. The occupations are almost wholly agricultural, dairy farming and market gardening being the principal. Only the textile manufactures are those of friezes, flannels, and coarse linens for home use. The only mineral of any value is limestone.

The main line of the Midland Great Western railway enters the county from E. and passes W. by Mullingar and Athlone. From Mullingar a branch runs N.W. to Inny Junction, where lines diverge N. to Cavan (county Cavan), and W.N.W. to Longford (county Longford). A branch to Athlone and the Midland Great Western railway runs from Portarlington (Queen's county) to Athlone, and this and the Midland Great Western main line are connected by a short line between Clare and Streamstown, worked
by the latter company. Water communication with Dublin is furnished by the Royal Canal, traversing the centre of the county. A branch of the Grand Canal reaches Kilbeggan in the south.

The population (49,611 in 1891; 61,620 in 1901) decreases in excess of the average shown by the Irish counties, and emigration is considerable. About 92% of the total are Roman Catholics, and about 8% constitute the rural population. The principal towns are Athlone (pop. 6617), of which the part formerly in Roscommon was added to Westmeath by the Local Government (Ireland) Act of 1898, and Mullingar (4550), the county town. Castlepollard and Moate are lesser market towns. By the Redistribution Act of 1885 Westmeath was formed of the three parliamentary divisions, North and South, each returning one member, Athlone being included in the county representation. The county is divided into twelve baronies. Assizes are held at Mullingar and quarter sessions at Mullingar and Moate. The county is in the Protestant dioceses of Dublin, Killaloe and Ossory, and in the Roman Catholic dioceses of Kildare and Leighlin, Killaloe and Ossory.

Westmeath was severed from Meath (q.v.) in 1543. The plan for the insurrection of 1641 was concerted in the abbey of Mullingar, and both in the wars of this period and those of the great insurrection of 1641 and 1642 it was found that the majority of the estates were confiscated. There are a considerable number of raths or encampments; one at Rathconrath is of great extent; another at Ballymote was fortified during the wars of the Cromwellian period and those of 1688, and was afterwards the headquarters of General Ginkel, when preparing to besiege Athlone; and there is a third of considerable size near Lough Lene. The ruins of the Franciscan abbey of Mullifarnham, founded in 1236 by William Delaware, picturesquely situated near Lough Dereravagh, include a tower 93 ft. in height.

Westmeath, Marquesses of and Dukes of.

The title of marquess of Westmeath was bestowed in 1831 upon Robert Grosvenor, 2nd Earl Grosvenor (1767-1845), whose grandson, Hugh Lupus Grosvenor (1825-1890), was created duke of Westmeath in 1874. The family of Grosvenor is of great antiquity in Cheshire, the existence of a knightly house of this name (Le Grosvenor) in the palatine county being proved by deeds as early as the 12th century (see *The Ancestor*, vi. 19). The legend of its descent from a nephew of Hugh Lupus, earl of Chester, perpetuated in the name of the first duke, and the still more extravagant story, repeated by the old genealogists, and modern "peereages," of its ancestors, the "grand huntsmen" (gros veneurs) of the dukes of Normandy, have been exploded by the researches of Mr W. H. B. Bird (see "The Grosvenor Myth" in *The Ancestor*, vol. i. April 1902). The ancestors of the dukes of Westmeath, the Grosvenors of Eaton, near Chester, were cadets of the knightly house mentioned above, and rose to wealth and eminence through a series of fortunate marriages. Their baronetcy dates from 1622.

Sir Thomas Grosvenor, the 3rd baronet (1656-1700), in 1676 married Mary (d. 1730), heiress of Alexander Davies (d. 1665), a scion of an ancient Cheshire family. This union brought to the Grosvenor family certain lands, then on the outskirts of London, but now covered by some of the most fashionable quarters of the West End. Sir Thomas's sons, Richard (1689-1723), Thomas (1603-1733) and Robert (d. 1755), succeeded in turn to the baronetcy, Robert being the father of Sir Richard Grosvenor (1731-1802), created Baron Grosvenor in 1761 and Viscount Belgrave and Earl Grosvenor in 1784. The 1st earl, a great breeder of racehorses, was succeeded by his only surviving son Robert (1787-1843), who rebuilt Eaton Hall and developed his London property, which was rapidly increasing in value. In the House of Commons, where he sat from 1788 to 1802, he was a follower of Pitt, who made him a lord of the admiralty and later a commissioner of the board of control, but after 1806 he left the Tories and joined the Whigs. He was created a marquess at the coronation of William IV. in 1831. His son, Richard, the 2nd marquess, (1795-1860), was a member of parliament from 1818 to 1835 and lord steward of the royal household from 1830 to 1837. The latter's son, Hugh Lupus (1825-1890), created a duke in 1874, was from 1847 to 1890 member of parliament for Chester and from 1880 to 1885 master of the horse under Gladstone, but he left the Liberal party when the split came over Home Rule for Ireland. His great wealth made him specially conspicuous; but he was a patron of many progressive movements. His eldest son, Victor Alexander, Earl Grosvenor (1853-1884), predeceased him, and he was succeeded as 2nd duke by his grandson, Hugh Richard Arthur Grosvenor (b. 1875), who in 1901 married Miss Cornwallis-West. Earl Grosvenor's widow, Countess Grosvenor, a daughter of the 9th earl of Scarborough, became a baroness of Westmeath.

Two other peerages are held by the Grosvenor family. In 1857 Lord Robert Grosvenor (1801-1883), a younger son of the 1st marquess, after having sat in the House of Commons since 1822, was created Baron Ebury. He was an energetic opponent of ritualism in the Church of England; and he was associated in philanthropic work with the earl of Shaftesbury. On his death his son, Robert Wellesley Grosvenor (b. 1834), became the 2nd baron. In 1886, Lord Richard Grosvenor (1836-1913), a son of Lord Ebury, was created a viscount, one of the 1st of 1902). The council consists of a mayor, 10 aldermen and 60 councillors. The city comprises the parliamentary boroughs of the Strand, Westminster and St George's, Hanover Square, each returning one member. Area, 2502-7 acres. The City of Westminster, as thus depicted, extends from the western end of Fleet Street to Kensington Gardens, and from Oxford Street to the Thames, which it borders over a distance of 3 m., between Victoria (Chelsea) Bridge and a point below Waterloo Bridge. It thus includes a large number of the finest buildings in London, from the Law Courts in the east to the Imperial Institute in the west, Buckingham Palace and St James's palace, the National Gallery, and most of the greatest residences of the wealthy classes. But the name of Westminster is more generally associated with a more confined area, namely, the quarter which includes the Abbey, the Houses of Parliament, the government and other buildings in Whitehall, the Roman Catholic Cathedral, and the parts immediately adjacent to these.

Westminster Abbey.—The Abbey of St Peter is the most widely celebrated church in the British empire. The Thames, bordered in early times by a great expanse of fen on either hand from Chelsea and Battersea downward, connects the point where the Abbey stands, on the north shore of a low island perhaps three-quarters of a mile in circumference, known as Thorney or Bramble islet. Tributary streams from the north formed channels through the marsh, flanking the island north and south, and were once connected by a dyke on the west. These channels belonged to the Tyburn, which flowed from the high ground of Hampstead. Relics of the Roman occupation have been excavated in the former island, and it is supposed that traffic on the Watling Street, from Dover to Chester, crossed the Thames and the marshes by way of Thorpe burn before the construction of London Bridge; the road continuing north-west in the line of the modern Park Lane (partly) and Edgware Road. Tradition places on the island a temple of Apollo, which was destroyed by an earthquake in the reign of the emperor Antoninus Pius. On the site King Lucius is said to have founded a church (c. A.D. 170). The irrigation of the Saxons left Thorney desolate. Traditional still, but supported by greater probability, a story states that Sebert,
king of the East Saxons, having taken part in the foundation of St Paul's Cathedral, restored or refounded the church at Thorney "to the honour of God and St Peter, on the west side of the City of London." A splendid legend relates the coronation of St Peter in person to hallow his new church. The sons of Sebert relapsed into idolatry and left the church to the mercy of the Danes. A charter of Offa, king of Mercia (785), deals with the conveyance of certain land to the monastery of St Peter; and King Edgar restored the church, clearly defining by a charter dated 951 (not certainly genuine) the boundary of Westminster, which may be indicated in modern terms as extending from the Marble Arch south to the Thames and east to the City boundary, the former river Fleet. Westminster was a Benedictine founda-

tion. In 1060 Edward the Confessor took up the erection of a magnificent new church, cruciform, with a central and two western towers. Its building continued after his death, but it was consecrated on Childermas Day, 28th December 1065; and on the following "twelfth mass eve" the king died, being buried next day in the church. In 1245 Henry III. set about the rebuilding of the church east of the nave, and at this point it becomes necessary to describe the building as it now appears.

Westminster Abbey is a cruciform structure consisting of nave with aisles, transepts with aisles (but in the south transept the central aisle has entirely disappeared), a western choir, eastern cloister walk, and choir of polygonal apsidal form, with six chapels (four polygonal) opening north and south of it, and an eastern Lady Chapel, known as Henry VII's chapel. There are two western towers, but in the centre a low square tower hardly rises above the pitch of the roof. The main entrance in common use is that in the north transept. The chapter-house, cloisters and other conventional buildings and remains lie to the south. The total length of the church (exterior) is 531 ft. and of the transepts 205 ft. in all. The breadth of the nave is 132 ft., that of the aisles 11 ft. 2 in. and its height 102 ft. These dimensions are very slightly lessened in the choir. Without, viewed from the open Parliament Square to the north, the beautiful proportions of the building are readily realized, but it is somewhat dwarfed by the absence of a central tower and by the vast adjacent pile of the Houses of Parliament. From this point (considered as a building merely) it appears only as a secondary unit in a magnificent group. Seen from the west, however, it is the dominant unit, but here it is impossible to overlook the imperfect conception of the "architect" (who he was or what or how it manifested by Wren) from whose design the western towers took shape in 1740. The north front, called Solomon's Porch from a former porch over the main entrance, is from the designs of Sir G. G. Scott, considerably altered by J. L. Pearson.

Within, the Abbey is a superb example of the pointed style. The body of the church has a remarkable appearance of uniformity, because, although the building of the new nave was continued with interruptions from the 14th century until Tudor times, the broad design of the Early English work in the eastern part of the church was carried on throughout. The choir, with its unusual form and radiating chapels, plainly follows French models, but the name of the architect is lost. Exquisite ornament is seen in the triforium arcade, and between some of the arches in the transept are figures, especially finely carved, though much mutilated, known as the censing angels. Henry VII's Chapel replaces an earlier Lady Chapel, and is the most remarkable building of its period. It comprises a nave with aisles, and an apsidal eastward end formed of five small radiating chapels. Both within and without it is ornamented with an extraordinary wealth and minuteness of detail.

A splendid series of carved oak stalls lines each side of the nave, and above them hang the banners of the Knights of the Bath, of whom this was the place of installation when the Order was re-

constituted in 1815. The main screen and side screens of the transepts, the pendants, is the most exquisite architectural feature of the chapel. The choir stalls in the body of the church are modern, as is the organ, a fine instrument with an "echo" attachment, electrically controlled, in the triforium of the south transept. The restoration is by Sir G. G. Scott; with mosaic by Salvati. In Abbot Islip's chapel there is a series of effigies in wax, representing monarchs and others. The effigies of the bones and the less preserved figures of series II. survive. Some of the effigies were carried in funeral processions according to custom, but this was done not later than 1735. There are, however, figures of Lord Chatham and Nelson, set up by the officials who received the fees formerly paid by visitors to the exhibition.

But the peculiar fame of the Abbey lies not in its architecture, nor in its connexion with the metropolis alone, but in the fact that it has long been the place of coronation, the coronation crowns of Edward II. and the burial-places of many of them and of their greatest subjects. The original reason for this was the reverence attaching to the memory of the Confessor, whose shrine is in the central aisle of the church. The remains of Norman kings were ready to do honour to his name. From William the Conqueror onward every sovereign has been crowned here excepting Edward V. The coronation chairs stand in the Confessor's chapel, and are by the same artist as the thrones of Edward I., and contain beneath its seat the stone of Scone, or stone of destiny, on which the Celtic kings were crowned. It is of Scottish origin, but may have been copied from one of the Irish thrones of the 10th century. The stool of the king and queen is set up to the right of the altar. At the sides are kept the sword and shield of Edward III., still used in the coronation ceremony. The second chair was made for Mary, consort of William III. Subsequent to the Conquest many kings from France were buried here. Of all the graves, perhaps the most famous is that of Henry VII. and his queen, Elizabeth of York, the central object in his choir. The splendid remembrance effigies in bronze, of Italian workmanship, rest upon a tomb of black marble, and the whole is enclosed in a magnificent shrine of wrought brass. Monuments, tombs, busts and memorials crowd the choir, its chapels and transepts, not wholly without limit. It is true that the minority of the Gothic period (among which the canopied tombs of Edmund Crouchback and Aymer de Valence, in the sanctuary, are notable) appear incongruous in a Gothic setting. Many of the effigies are effaced, and not without reason. The effigies of the kings and queens, however, are the subjects they commemorate always worthy to lie here, for the high honour of burial in the Abbey was not always so conscientiously observed. Now, however, a wonderful range of sculptural art is found. A part of the south transept is famed under the name of the Poet's Corner. The north transept contains many monuments to statesmen.

The abbey was dissolved in 1539, and Westminster was then erected into a bishopric, but only one prelate, Thomas Turley, held the office of bishop. In 1555 Mary again appointed an abbot, but Elizabeth reinstated the dean, with twelve prebends. Of the conventional buildings the cloisters are of the 13th and 14th centuries. On the south side of the southern walk remains of a wall of the refectory are seen from without. From the eastern walk a arch gives entry to the cloisters and the chapel of the Pyx. The first is of the time of Henry III., a fine octagonal building, its vaulted roof supported by a slender clustered column of marble. It was largely restored by Sir George Gilbert Scott in 1865.

The second is of the time of Henry VIII., a vaulted building, with the Pyx kept in it, and is the oldest building of its kind in the country. It is built of brick with stone dressings, and is supposed to be the ancient Bishop's House.

The third, dating from 1601, has a small cloister attached, and is supposed to have been the Provost's House. It was given to the Duke of Devonshire in 1776, and is now the counting-house of the Bank of England.

The cloisters are the Deanery, Jerusalem chamber and College Hall, the building surrounding a small court and dating in fabric mainly from the 14th century. This was the Abbot's house, its most famous portion is the Jerusalem chamber, believed to be named from the former tapisseries on its walls, representing the holy city. Here died Henry IV. in 1435, as set forth in Shakespeare's Henry IV. (Part 2, Act iv. Sc. 4). It is a beautiful room, with open timber roof, windows partly of stained glass, and walls tapestried and paneled. The College Hall, adjoining it, is of similar construction, but plainly fitted in the common manner of a refectory, with a High table and high chairs, with a gallery on the south side. It is now the dining-hall of Westminster School.

Westminster School.—St Peter's College, commonly called Westminster School, is one of the most ancient and eminent public schools in England, and the only school of such standing still occupying its original site in London. A school was maintained by the monks from very early times. Henry VIII. took steps to raise it in importance, but the school owes its greatest growth to Queen Elizabeth, who endowed it with the endowment of a Latin commemoration service held periodically in the Abbey, where, moreover, the daily school service is held. The school buildings lie east of the conventional buildings, surrounding Little Dean's Yard, which, like the cloisters, communicates with Dean's Yard, in which are the picturesque houses of the headmaster, canons of the Abbey, and others. The buildings are modern or large modernized. The Great Schoolroom
is a fine panelled hall, bearing on its walls the arms and names of many eminent alumni; it is entered by a gateway attributed to Inigo Jones, also covered with names. Ashburnham House, now containing one of the school houses, the library and class-rooms, is named from the family for whom it was built, traditionally but not certainly, by Inigo Jones. The finest part remaining is the grand staircase. The number of scholars, called King's Scholars, on the foundation is 60, of which 40, who are boarders, represent the original number. The present proprietors of the boys are house boarders (Town Boys). In the College dormitory a Latin play is annually presented, in accordance with ancient custom. It is preceded by a prologue, and followed by a humorous epilogue, in Latin adapted to subjects of the moment. Other customs for which the school is noted are the acclamation of the sovereign at coronation in the Abbey, in accordance with a privilege jealously held by the boys; and the "Pancake Grease," a struggle in the Great Schoolroom on Shrove Tuesday to obtain possession of a pancake carrying with it a reward from the Dean. The number of boys is about 250. Valuable close scholarships and exhibitions at Christ Church, Oxford, and Trinity College, Cambridge, are awarded annually.

St Margaret's.—On the north side of the Abbey, close beside it, is the parish church of St Margaret. It was founded in or soon after the time of the Confessor, but the present building is Perpendicular, of greater beauty within than without. St Margaret's is officially the church of the House of Commons. It is frequently the scene of fashionable weddings, which are rarely held in the Abbey. On the south side of Dean's Yard is the Church House, a memorial of Queen Victoria's Jubilee (1887), consisting of a proportionate hall of brick and stone, with offices for numerous Church societies.

Westminster Palace: Houses of Parliament.—A royal palace existed at Westminster at least as early as the reign of Canute, but the building spoken of by Fitzstephen as an "incomparable structure furnished with a breastwork and a bastion" is supposed to have been founded by Edward the Confessor and enlarged by William the Conqueror. The Hall, called Westminster Hall, was built by William Rufus and altered by Richard II. In 1352 the palace suffered greatly from fire, and thereafter ceased to be used as a royal residence. Stephen's chapel, originally built by King Stephen, was used from 1557 for the meetings of the House of Commons, which had been held previously in the chapter house of the Abbey. The Lords used another apartment of the palace, but on the 16th of October 1834 the whole of the buildings, except the hall, was burnt down. In 1840 the building of the New Palace, or Houses of Parliament, began, and it was completed in 1867, at a cost of about three millions sterling. (For plan, &c., see ARCHITECTURE: Modern.) It covers an area of about 8 acres, and has a frontage of about 300 yds. to the Thames. The architect was Sir Charles Barry, and the style is late Perpendicular.

Towards the river it presents a rich façade with a terrace rising directly from the water. At the south-west corner rises the vast Victoria tower, above the royal entrance, 340 ft. high, and 75 ft. square. At the north is the clock tower, 320 ft. high, bearing the great mural clock, with four smaller ones on the corners, and striking hours on a bell weighing over 13 tons, named Big Ben after Sir Benjamin Hall, First Commissioner of Works at the time when the clock was erected. It incorporates Westminster Hall, which contains 200 ft. in length, 68 in width, and 60 in height. It has a magnificent open roof of carved oak, and is used as the vestibule of the Houses of Parliament. Of the modern rooms, the House of Peers is a magnificent oval chamber, 97 ft. in length, that of the Commons is 70 ft. long, and less lavishly adorned. The sitting of parliament is signified by a flag on Victoria Tower in daytime and by a light at the summit of the clock tower at night.

Whitehall.—Northward from Parliament Square a broad, slightly curving thoroughfare leads to Trafalgar Square. This is Whitehall, which replaced the narrow King Street. Here, between the Thames and St. James's Park, formerly stood York House, a residence of the archbishops of York from 1248. Worsley beautified the mansion and kept high state there, but on his disgrace Henry VIII. acquired and reconstructed it, employed Holbein in its decoration, and made it his principal residence. Inigo Jones designed a magnificent new palace for James I., but only the banqueting hall was completed (1622), and this survived several fires, by one of which (1697) nearly the whole of the rest of the palace was destroyed. The hall, converted into a royal chapel by George I., and now housing the museum of the Royal United Service Institution, the buildings of which adjoin it, is a fine specimen of Palladian architecture, and its ceiling is adorned with allegorical paintings by Rubens, restored and rehung in 1864. The museum contains military and nautical relics, models and other exhibits. Through this hall Charles I. passed on his way to execution beneath its windows; and the palace was the scene of the death of Henry VIII., Cromwell and Charles II.

The principal government offices are situated in Whitehall. On the left, following the northerly direction, are buildings completed in 1608, from the designs of J. M. Wren, for the Board of Education, Trade, Local Government, &c. The Home, Foreign, Colonial and India Offices occupy the next block, a heavy building, adorned with allegorical figures, by Sir G. G. Scott (1873). Downing Street, the seat of the Prime Minister, was built in 1735. On the right is the building surrounding a court-yard, built in 1753 on the site of a guard-house for the security of Whitehall palace, dating from 1631. On the south, the ground is levelled and surrounded by a fence of trooping of the colour is held at the celebration of the sovereign's birthday. The portion of the Admiralty facing Whitehall dates from 1726 and is plain and sombre; but there are handsome new buildings. The site on the north side. On the right of Whitehall, besides the banqueting hall, are the fine War Office, completed in 1906, from the designs of W. Young, and Montagu House, the residence of the duke of Buccleuch. In front of the War Office an equestrian statue of the duke of Cambridge (by H. Timothy) was unveiled in 1907.

Trafalgar Square is an open space sloping sharply to the north. On the south side, facing the entry of Whitehall, is the Nelson monument, by W. Railton, 145 ft. in height, a copy in granite from the temple of Mars Ultor in Rome, crowned with a statue of Nelson by E. H. Baily, and having at its base four colossal lions in bronze modelled by Sir Edwin Landseer. The centre of the square is lined with paves of white marble, and striking the eye. There are statues of George IV., Napier, Havelock and Gordon. Behind the terrace on the north rises the National Gallery (1838), a Grecian building by William Wilkins, subsequently much enlarged, with its splendid collection of paintings. The National Portrait Gallery is contained in a building (1895) on the north-east side of the National Gallery.

Westminster Cathedral.—A short distance from Victoria Street, towards its western end, stands Westminster Cathedral (Roman Catholic). Its foundation was laid in 1866, and its consecration was at the close of 1895. It is somewhat sombre, and is smaller in size, than its bulk rendering it less than a general appreciation of its complex outline; but its stately domed campanile, 283 ft. in height, forms a landmark from far over London. The style was described by the archbishop, J. F. Bentley, as early Christian Byzantine, and the material is mainly red brick. The extreme length is 360 ft., the breadth 130 ft., the breadth of the nave 60 ft., and its height (domes within) 112 ft.

WESTMINSTER, STATUTES OF, two English statutes passed during the reign of Edward I. Parliament having met at Westminster on the 22nd of April 1275, and after due consideration of the statute of Westminster I. This was drawn up, not in Latin, but in Norman French, and was passed "par le assentement des erceveskes, eveskes, abbayes, prius, contes, barons, et la communauté de la tete ilekomes somons." Its provisions can be best summarized in the words of Stubbs (Const. Hist. cap. iv.):—

"This act is almost a code by itself; it contains fifty-one clauses, and covers the whole ground of legislation. Its language now to a large extent of Canute, but Alfred, now and contains two fourths; on the one hand common right is to be done to all, as well poor as rich, without respect of persons; on the other, elections are to be free, and no man is by force, malice or menace, to disturb them. The spirit of this statute is the most remarkable in the various enactments, abuses of wardship, irregular demands for feudal aids, are forbidden in the same words or by abridging enactments. The inquest system of Henry II., the law of wreck, and
the institution of coroners, measures of Richard and his ministers, come under review as well as the Provisions of Oxford and the Statute of Marlborough."

The second statute of Westminster was passed in the parliament of 1285. Like the first statute it is a code in itself, and contains the famous clause De donis conditionibus (g.), "one of the fundamental institutes of the medieval, Oxford, England." Stubbs says of it: "The law of dover, of ad- vowson, of appeal for felonies, is largely amended; the in- stitution of justices of assize is remodelled, and the abuses of manorial jurisdiction repressed; the statute De religiosis, the statutes of Merton and Gloucester, are amended and re-enacted. Every clause has a bearing on the growth of the later law."

From Synods against Emperors of 1950 is sometimes called the statute of Westminster III.

WESTMINSTER, SYNODS OF. Under this heading are included certain of the more important ecclesiastical councils held within the present bounds of London. Though the precise locality is occasionally uncertain, the majority of the medieval synods assembled in the chapter-house of old St Paul's, or the former chapel of St Catherine within the precincts of West- minster Abbey or at Lambeth. The councils were of various types, each with a constitutional history of its own. Before the reign of Edward I, when convocation assumed substantially its present form (see Convocation), there were convened in London various diocesan, provincial, national and legatine synods; during the past six centuries, however, the chief ecclesiastical assemblies held there have been convocations of the province of Canterbury.

The first really notable council at St Paul's was that of 1075 under the presidency of Lanfranc; it renewed ancient regulations, forbade simony and permitted three bishops to remove from country places to Salisbury, Chichester and Chester respectively. In 1102 a national synod at Westminster under Alexander II adopted clauses against simony, simoniacal and slavery. The councils of 1126, 1127 and 1138 were legatine, that of 1175 provincial; their canons, chiefly re-enactments, throw light on the condition of the clergy at that time. The canons of 1200 are based in large measure on recommendations of the Lateran Council of 1179. At St Paul's the legatine constitutions of Otto were published in a synod of 1237, those of Ottobon in 1268: these were the most important national councils held after the independence of York had been established. A synod at Lambeth in 1281 put forth canons none too well received to Edward I; they included a detailed scheme for the religious instruction of the faithful. During the next two centuries the councils devoted much attention to heresy; eight propositions concerning the body of Christ after his death were rejected at St Mary-le-Bow in 1286; the expulsion of the Jews from England was sanctioned by a legatine synod of Westminster in 1291; ten theses of Wiclif's were condemned at the Dominican friary in 1382, and eighteen articles drawn from his Triologus met the same fate at St Paul's in 1396; and the doom of Sir John Oldcastle was sealed at the latter place in 1413. The 14th-century synods at St Paul's concerned them- selves largely with the financial and moral status of the clergy, and made many quaint regulations regarding their dress and behaviour (1328, 1342, 1343; cf. 1465). From the time of Edward VI on, many of the most vital changes in ecclesiastical discipline were adopted in convocations at St Paul's and in the Abbey. To enumerate them would be to give a running com- mentary on the development of the Church of England; among the most important were those of 1547, 1552, 1554, 1562, 1577, 1602, 1632 and 1662. In 1852 there was held the first of a series of synods in the new Diocese of London. For the "Pan-Anglican Synods" see LAMBERT CONFERENCES.

W. W. R.*

WESTMORLAND, EARLS OF. Ralph Neville, 4th Baron Neville of Raby, and 1st earl of Westmorland (1364-1425), eldest son of John, 3rd Baron Neville, and his wife Maud Percy (see Neville, Family), was knighted by Thomas of Woodstock, afterwards duke of Gloucester, during the French expedi- tion of 1380, and succeeded to his father's barony in 1388. He had been joint warden of the west march in 1386, and was reappointed for a new term in 1390. In 1391 he was put on the committee which was to enforce the duties of constable in place of the duke of Gloucester, and he was repeatedly engaged in negotiations with the Scots. His support of the cause of the earl against the lords appellant was rewarded in 1397 by the earldom of Westmorland. He married as his second wife Joan Beaufort, half-sister of Henry of Lancaster, afterwards Henry IV, whom he joined on his landing in Yorkshire in 1399. He already held the castles of Brancepeth, Raby, Middleton and Sherif Hutton when he received from Henry IV. the honour and lordship of Richmond for life. The only rivals of the Nevilles in the north were the Percies, whose power had been broken at Shrewsbury in 1403. Both marches had been in their hands, but the warden- ship of the west marches was now assigned to Westmorland, whose influence was also paramount in the east, which was under the nominal wardenship of the young Prince John, afterwards duke of Bedford. Westmorland had prevented North- umberland from marching to reinforce Hotspur in 1403, and before embarking on a new revolt he sought to secure his enemy, surrounding, but too late, one of Sir Ralph Eure's castles where the earl had been staying. In May the Percies were in revolt, and Thomas Mowbray, 1st earl, and Archbishop Scrope. Westmorland met them on the 26th of May 1405, and suggested a parley between the leaders. By pretending accord with the archbishop, the earl induced him to allow his followers to disperse. Scrope and Mowbray were then seized and handed over to Henry at Pontefract on the 3rd of January. The improbabilities of this narrative have led some writers to think, in face of contemporary authorities, that Scrope and Mowbray must have surrendered voluntarily. If Westmorland betrayed them he at least had no share in their execution. The Percy's power was busily engaged in negotiating with the Scots and keeping the pace on the borders. He did not play the part assigned to him by Shakespeare in Henry V, for during Henry's absence he remained in charge of the north, and was a member of Bedford's council. He consolidated the strength of his family by marriage alliances. His daughter Catherine married in 1412 John Mowbray, second duke of Norfolk, brother and heir of the earl marshal, who had been executed after Shipton Moor; Anne married Humphrey, first duke of Buckingham; Eleanor married, after the death of her first husband Richard le Despenser, Henry Percy, 2nd earl of Northumberland; Cicely married Richard, duke of York, and was the mother of Edward IV. and Richard III. The sons by his second marriage were Richard Neville, earl of Salisbury, William, Baron Fauconberg, George, Baron Latimer, Robert, bishop of Salisbury and then of Durham, and Edward, Baron Abergavenny. The earl died on the 21st of October 1425, and a fine alabaster tomb was erected to his memory in Staindrop church close by Raby Castle.

Ralph, 2nd earl of Westmorland (c. 1404-1484), the son of John, Lord Neville (d. 1423), succeeded his grandfather in 1425, and married as his first wife Elizabeth Clifford, daughter of Sir Henry Percy (Hotspur), thus forming further bonds with the Percies. The 3rd earl, Ralph Neville (1456-1490), was his nephew, and the son of John Neville, Lord Neville, who was slain at Towton. His grandson Ralph, 4th earl of Westmorland (1490-1550), was an energetic border warrior, who remained faithful to the royal cause when the other great northern lords
WESTMORLAND

joined the Pilgrimage of Grace. He was succeeded by his son
Henry, 5th earl (c. 1525-1563).

Charles, 6th earl (1545-1601), eldest son of the 5th earl by his
first wife Jane, daughter of Thomas Manners, 1st earl of
Rutland, was brought up a Roman Catholic, and was further
attached to the Catholic party by his marriage with Jane,
daughter of Henry Howard, earl of Surrey. He was a member
of the council of the north in 1569 when he joined Thomas Percy,
7th earl of Northumberland, and his uncle Christopher Neville,
in the Catholic rising of the north, which had as its object the
liberation of Mary, queen of Scots. On the collapse of the ill-
organized insurrection Westmorland fled with his brother earl
over the borders, and eventually to the Spanish Netherlands,
where he lived in receipt of a pension from Philip II. of Spain,
until his death on the 16th of November 1601. He left no sons,
and his honours were forfeited by his formal attainer in 1572.
Raby Castle remained in the hands of the crown until 1645.

The title was revived in 1624 in favour of Sir Francis Fane
(c. 1574-1629), whose mother, Mary Neville, was a descendant
of a younger son of the first earl. He was created baron of
Burghersh and earl of Westmorland in 1624, and became Lord
le Despenser on his mother's death in 1626. His son Mildmay
Fane, 2nd or 5th earl of Westmorland (c. 1662-1660), at first
sided with the king's party, but was afterwards reconciled with
the parliament. John Fane, 7th or 13th earl of Westmorland
(1662-1760), served under Marlborough, and was made in
1708 lieutenant-general of the British armies.

His son, the 14th earl, only son of John,
9th earl, was known as Lord Burghersh until he succeeded to
the earldom in 1841. He entered the army in 1803, and in 1805
took part in the Hanoverian campaign as aide-de-camp to
General Sir George Don. He was assistant adjutant-general
in Sicily and Egypt (1806-1809), served in the Peninsular War
from 1808 to 1813, was British military commissioner to the
allied armies under Schwarzenberg, and marched with the
allies to Paris in 1814. He was subsequently promoted major-
general (1825), lieutenant-general (1838) and general (1854),
although the latter half of his life was given to diplomatic
service. He was British resident at Florence from 1814 to
1839, and British ambassador at Berlin from 1841 to 1851,
when he was transferred to Vienna. In Berlin he had mediated
in the Schleswig-Holstein question, and in Vienna he was one of
the British plenipotentiaries at the congress of 1855. He retired
in 1855, and died at Apthorpe House, Northamptonshire, on
the 16th of October 1859. Himself a musician of considerable
reputation and the composer of several operas, he took a keen
interest in the cause of music in England, and in 1832 made
proposals which led to the foundation in the next year of the
Royal Academy of Music. His wife Priscilla Anne (1793-1879),
daughter of William Wellesley-Pole, 3rd earl of Mornington,
was a distinguished artist.

His published works include Memoirs of the Early Campaigns of
the Duke of Wellington in Portugal and Spain (1820), and Memoir
of the Operations of the Allied Armies under Prince Schwarzenberg
and Marshal Blucher (1822).

Francis William Henry, 12th or 18th earl (1825-1891), fourth
son of the preceding, was also a distinguished soldier. He
entered the army in 1843 and served through the Punjub cam-
pan. In 1848 he became aide-de-camp to the governor-general
in 1848, and distinguished himself at Gjerkut on the 21st of
February 1849. He went to the Crimea as aide-de-camp to Lord
Raglan, and was promoted lieutenant-colonel in 1855. On
his return to England he became aide-de-camp to the duke
of Cambridge, and received the Crimean medal. The death
of his elder brother in 1851 gave him the style of Lord Burghersh,
and after his accession to the earldom in 1859 he retired from
the service with the rank of colonel. He died in August 1891
and was succeeded by his son, Anthony Mildmay Julian Fane,
b. 1870 (1870) at 16th earl.

WESTMORLAND, a north-western county of England, bounded
N.W. by Cumberland, N.E. for a short distance by
Durham, E. by Yorkshire, S. and S.W. by Lancashire. It
reaches the sea in the Kent estuary in Morecambe Bay. The
area is 786.2 sq. m. Physically the county may be roughly
divided into four areas. (1) The great upland tract in the north-
eastern part, bordering on the western margin of Yorkshire
and part of Durham, consists mainly of a wild moorland area,
rising to elevations of 720 ft. in Millburn Forest, 2403 in Dutton
Forest, and 2816 ft. in the Bowfell group of the Western Fells.
(2) The second area comprises a third of the Lake District (g.r.),
westward from Shap Fells. This area includes High Street (2663 ft.),
Helvellyn (3181) and Fairfield (2863), Langdale Pikes (2401)
and on the boundary Bow Fell (2060), Crinkle Crags (2816) and
Pike o' Blisco (3046). It must also be taken to cover the elevated
area on the Yorkshire border which includes the Ravenstonedale
and Langdale Fells to the N. and the Middleton and Barbon
Fells to the S., of an intrusive angle of Yorkshire. This area,
however, which reaches in some points over 2260 ft. of altitude,
is marked off from the Lake District mountains by the Lune
valley. All but the lower parts of the valleys within these two
areas lie at or above 1000 ft. above Ordnance datum; and more
than half the remainder lies between that elevation and 1750 ft.,
the main mass of high land lying in the area first mentioned.
(3) The third area includes the comparatively low country
between the northern slopes of that just described and the edge
of the uplands to the north-east thereof. This covers the Vale
of Eden. About three-fifths of this area lies between the 500
and the 1000 ft. contour. (4) The Kendall area consists mainly
in the western lowland of the county, and the Silurian rocks
are divided into three-fifths above 2600 ft. More than half this
area lies below the 500 ft. contour. Westmorland may thus be said to be
divided in the middle by uplands ranging in a general south-easterly
direction, and to be bordered all along its eastern side by
the elevated moorlands of the Pennine chain. The principal
rivers are—in the northern area the higher part of the Tees, the Eden
with its main tributaries, the Lowther and the Eamont, and in
the southern area the Lune and the Kent, with their numerous
tributary becks and gills. The lakes include Windermere,
partin of Ullswater, Grasmere. Hawes Water and numerous
smaller lakes and tarns, which are chiefly confined to the north-
western parts of the county. Amongst the other physical
features of more or less interest are numerous crags and
sers, chiefly in the neighbourhood of the lakes; others are Mallerstang
Edge, Helbeck, above Brough; Haikable or High Cup Gill,
neak Appleby; Orton Sears; and the limestone crags west of
Kirkby Lonsdale. Among the waterfalls are Caldron Snout,
on the northern confines of the county, flowing over the Whin
Sill, and Stock Gill Force, Ryal Falls, Skelwith Force, and
Doune Gill Force, all situated amongst the volcanic rocks in
the western fellland. Hillhead Crags, near Kirkby Stephen,
are conspicuous examples of natural
arches eroded by the streams flowing through them.

Geology.—The diversity of scenery and physical features in
this county are directly traceable to the influence of geological
structure. In the mountainous north-western portion, which includes
the heights of Helvellyn, Langdale Pikes, and Bow Fell, and the lakes
Ullswater, Hawes Water, Grasmere and Esthwaite, we find
the great mass of igneous rocks known as the Borrowdale volcanic
series—andesites, basalts and tuffs—of Ordovician age. On the
south-western and north-western sides of these volcanic masses
the Silurian rocks occur in the northern part of the county; their southern
boundary runs north-easterly from the upper end of Windermere by Kentmere
and past the granitic mass of Shap Fell; whence the boundary
turns north-westward through Rylsm to the east end of Ullswater.
Narrow strips of Ordovician Skiddaw slate occur on the south banks
of Ullswater and fringe the Borrowdale rocks for some distance east of
them. A large area of Caledonian rocks occupies most of the
south-western part of the county from Windermere to Ravenstonedale
and southward to Sedbergh, Kendal and Kirkby Lonsdale.
The Ordovician and Silurian rocks are bordered on the east and
north-eastern parts of the county by the Carboniferous limestone
of the Garstang and Clitheroe areas. The classic example of
this limestone is found again on the east side of the Eden valley in Millburn
Forest, Dutton Fell, Steeinsmore and Winsford Fell. Here and there
in the south-east corner Millstone Grit and Shales cap the limestone
and some little distance east of Brough under Stainmore a small patch of Coal Measures remains. At the base of the Carboniferous red sandstones is a red clay deposit, of which may be regarded as Old Red Sandstone age; it may be traced from Ullswater through Butterwick, Rasgill and Teyab, and it rises again at Sedbergh, Barrow and around Kendal. The limestones on the east side of the Eden the Great Whin Sill, a diabase dyke, may be followed for a considerable distance. In the Eden valley two sets of red sandstones occur, that on the western side being red and the eastern Maryport and Whitehaven red and limestone. There are 115 civil parishes. Westmorland is in the diocese of Carlisle, and contains 86 ecclesiastical parishes or districts, wholly or in part. There are two parliamentary divisions, Northern or Appleby and Southern or Kendal, each returning one member.

History.—The earliest English settlements in the district which is now Westmorland were effected by the Anglian tribes who entered Yorkshire by the Humber in the 6th century and laid the foundations of the kingdom of Deira, which included within its bounds that portion of Westmorland afterwards known as the barony of Kendal. The northern district, corresponding to the later barony of Appleby, meanwhile remained unconquered, and it was not until the close of the 7th century that Egfrith drove out the native Britons and established the Northumbrian supremacy over the whole district. With the Danish invasions of the 9th century the Kendal district was included in the Danelaw, while the barony of Appleby formed a portion of the land of Carlisle. The first mention of Westmorland in the Saxon Chronicle occurs under 969, when it was conquered by King Guthred. The annexation of the northern portion of Westmorland to the crown of England was accomplished by William Rufus, who in 1102 drove out Dolan from the land of Carlisle, and fortified Brough-under-Stainmore, Brougham, Appleby and Pendragon. In the reign of Henry I. the barony of Appleby was included in the grant to Ranulf Meschin of the earldom of Carlisle, but on the accession of Ranulph to the earldom of Chester in 1120 it was surrendered to the crown, and its inclusion in the pipe roll of 1131 shows that Westmorland was now definitely established as the dynamic basis of an English county.

The barony of Kendal was held in the 12th century by the Mowbrays, and from them passed to the family of Lancaster, who held it as of the honour of Westmorland. In the 13th century it was separated into two moieties; the Lindsay moiety which passed from the Lindsays to the Copelands and Couys and in the reign of Henry VI. to the Beaumonts and Richmonds, whence was derived its later name of Richmond Fee; the Brus moiety, which became subdivided into the Marquis Fee held by the Parr family, ancestors of Katherine Parr, and the Lumley Fee which passed from the Thwengs to the Lumleys and Hothams. The barony of Appleby, with the hereditary shrievalty, was bestowed by King John on the family of Vetepont, from whom it passed by female descent to the Clifords in the 13th century, and in the 16th century to the Tuftons, afterwards earls of Thanet, who retained the dignity until their descendant, Mr Barham of Trecwn, yielded his rights to the crown.

The division of Westmorland into wards originated with the system of defence against the inroads of the Scots, each barony being divided into two wards, and each ward into a half ward, a turn of which is held at certain fairs and other appointed places. The barony of Kendal was divided into Kendal and Lonsdale wards, and the barony of Appleby, called the Bottom, into east and west wards, there being anciently a middle ward between these last two. The shire court and assizes for the county were held at Appleby.

The barony of Appleby was included in the diocese of York from the 7th century, and in 1201 formed the deaneries of
Lonsdale and Kendal within the archdeaconry of Richmond. The barony of Appleby, which had been bestowed by Henry I. in the see of Carlisle, formed in 1291 the deanery of Westmorland within the archdeaconry and diocese of Carlisle. The barony of Kendal was placed by Henry VIII. in his new diocese of Chester, of which it remained a part until in 1876 it was constituted the archdeaconry of Westmorland within the diocese of Carlisle. In 1859 the Westmorland portion of the archdeaconry of Carlisle was subdivided into the deaneries of Appleby, Kirkby Stephen and Lowther; and the additional deanery of Ambleside was formed within the archdeaconry of Westmorland. The only religious foundation of any importance in Westmorland was the Premonstratensian house at Shap founded by Thomas, son of Gospatrik, in the 12th century.

The early political history of Westmorland after the Conquest is a record of continuous raids and devastations from the Scots. In the Scottish invasion of the northern counties which followed the battle of Bannockburn Brough and Appleby were burnt, and the county was twice harried by Robert Bruce in the ensuing years. In 1385 a battle was fought at Hoff near Appleby against the Scots under Earl Douglas, and in 1388, after Otterburn, the Scots sacked Appleby with such effect that nineteen-tenths of it lay in ruins and was never rebuilt. In the Wars of the Roses, Westmorland, under the Clifford influence, inclined to favour the Lancastrian cause, but was not actively concerned in the struggle. In the Civil War of the 17th century the county was in a state of unrest, and in 1641 Anne, countess of Pembroke, hereditary high sheriff of the county, garrisoned Appleby Castle for the king, placing it in charge of Sir Philip Musgrave, the colonel of the train-bands of Westmorland and Cumberland. In 1642 a memorable war was caused by nearly 5000 of the inhabitants of Westmorland and Cumberland protesting their loyalty and readiness to sacrifice their lives and fortunes in his service. Appleby Castle surrendered in 1648, but the strength of the royalist feeling was shown in the joy which greeted the news of the Restoration, the mayor of Appleby publicly destroying the charter which the town had received from Cromwell. The Jacobite rising of 1745 found many adherents in Westmorland, and a skirmish took place on Clink Moor between the forces of Lord George Murray and the duke of Cumberland.

The economic development of Westmorland, both on account of natural disadvantages and of the ravages of border strife, has been slow and unimportant; the rugged and barren nature of the ground being unfavourable to agricultural prosperity, while the lack of fuel hindered the growth of manufactures. Sheep-farming was the chief occupation of the county, and the Premonstratensian house at Shap supplied wool to the Florentine and Flemish markets in the 13th and 14th centuries. The clothing industry, which spread from Kendal to the surrounding districts, is said to have been introduced by one John Kempe of Flanders, who settled there in the reign of Edward III., and a statute of 1465 alludes to cloths of a distinct make being manufactured at Kendal. In 1589 the county suffered severely from the ravages of the plague, 2500 deaths being recorded in the deanery of Kendal alone. Speed, writing in the 17th century, says "it is crossed either for plenty of corn or cattle, being neither stored with arable grounds to bring forth the one, nor pasturage to lead up the other; the principal profit that the people of this province raise unto themselves is by clothing." The comb manufacture was established at Kendal in 1700, and about the same time the development of the boot and shoe trade to some extent supplemented the loss consequent on the decline of the clothing industry. There were two paper-mills at Milnthorpe in 1777, one of which existed eighty years before.

Westmorland returned two knights for the county to the parliament of 1290, and in 1295 two burgesses for the borough of Appleby. Under the Reform Act of 1832 Appleby was disfranchised and Kendal returned one member.

Antiquities.—Notable ecclesiastical buildings are almost entirely wanting in Westmorland, though mention may be made of the ruins of Shap Abbey, which lies near the small market town of that name in the bleak upper valley of the Lowther. The Perpendicular western tower and other fragments remain. Late Norman work is preserved in some of the churches, as at Kirkby Lonsdale, and in a few castles. Among the castles, the remains of Appleby, Brough, Brougham and Kendal are conspicuous, but examples are numerous. Among old houses, Levens Hall dates from the 16th century, and Sizergh Hall embodies part of an ancient castle; both are in the Kendal district. The formal gardens at Levens Hall are remarkable. Lowther Castle, near Penrith, the seat of the earl of Lonsdale, is a fine modern mansion, in a Gothic style more satisfactory in broad effect than in detail.

WESTON, THOMAS (1737-1776), English actor, was the son of a cook. His first London appearance was about 1759, and from 1763 until his death he was admitted to be the most amusing comedian on the English stage. Foote wrote for him the part of Falstaff in the "Prince of Parthia," which opened at Drury Lane in 1759. The part was taken by John Kempe, and that of the pilot by an actor called the Alchemist was one of his famous performances; and Garrick, who also played this part, praised him highly for it.

WESTON-SUPER-MARE, a seaside resort in the Wells parliamentary division of Somersetshire, England, on the Bristol Channel, 137 m. W. by S. of London by the Great Western railway. Pop. of urban district (1901), 19,048. It is built partly on level ground near the shore, and partly on the slopes of Worlebury Hill, which aids in giving shelter from the north and east. Among the first-clad slopes of the neighbourhood, which command a fine view of the Welsh hills across the Channel, there are many beautiful walks and drives. An esplanade extends for about 5 m., and public gardens have been laid out on Worlebury Hill, from the far end of which a long pier projects, linking the rocky islet of Birnbeck to the town. Grove Park, once the manor-house, is owned by the council, and is used as a free library, its grounds being open. Other institutions include a museum opened in honour of Queen Victoria's Diamond Jubilee, and the West of England Sanatorium, to which two large conservatories are attached, as a winter-garden for invalids. Weston has long been famous for its potteries, and there are mineral water-works and fisheries. Large quantities of oysters are caught. Intermittent springs exist in Weston, which are affected by the ebb and flow of the tide.

WEST ORANGE, a town of Essex county, New Jersey, U.S.A., in the N.E. part of the state, about 13 m. W. of New York City. Pop. (1800) 43,58, (1900) 6889 (1772 foreign-born); (1905, state census) 8722; (1910) 10,080. It is served by the Orange branch of the Erie railroad, and is connected with neighbouring towns and cities by electric lines. The town has an area of about 12 m., of which about 7 m. is suburban, and the chief towns are the First (also called the Orange or Watchung) Mountain and the Second Mountain. It is traversed by the Passaic River, which runs through the town from west to east, and by the Morris Canal, which runs through the town from south to north. The town is noted for its large number of schools, and for its many large residences, including the home of the late Mayor Hull, who was born and reared in the town. The town is also noted for its fine parks and playgrounds, and for the many fine homes which are built on its hillsides.

West Orange has a number of fine parks and playgrounds, and is noted for its many fine homes, which are built on its hillsides. The town is also noted for its fine schools, and for the many fine homes which are built on its hillsides.

See H. Whittemore, The founders and builders of the Oranges (Newark, 1896).
WESTPHAL, RUDOLF (1826-1862), German classical scholar, was born at Oberkirchen in Schaumburg on the 3rd of July 1826. He studied at Marburg and Tübingen, and was professor at Breslau (1858-1862) and Moscow (1875-1879). He subsequently lived at Bückeburg, and died at Stadthagen in Schaumburg-Lippe on the 10th of July 1872. Westphal was a man of varied attainments, but his chief claim to remembrance rests upon his contributions on Greek music and metre. His chief works are: Metrik (3rd ed., 1855-1856); System der antiken Rhythmik (1862); Handbuch der Griechischen Metrik (1866); Aristoxenus of Tarentum (translation and commentary, 1883-1885, vol. ii. being edited after his death by F. Saran); Die Musik des griechischen Altertums (1885); Allgemeine Metrik der indogermanischen and semitischen Volker (1892). He made translations of Catullus (1870) and of Aristophanes' Acharnians (1889), in which he successfully reproduced the Dorisms in Plattdeutsch.

WESTPHALIA (Ger. Westfalen), a province of the kingdom of Prussia. The ancient duchy and the Napoleonic kingdom of the same name, neither of which was conterminous with the modern province, are dealt with in the historical part of this article. The area of the province is 7801 sq. m., its length both from N. to S. and from E. to W. is about 130 m., and it is bounded N. by Hanover, E. by Schaumburg-Lippe, Hanover, Lippe-Detmold, Brunswick, Hesse-Nassau and Waldeck, S. and S.W. by Hesse-Nassau and the Rhine Province, and N.W. by the kingdom of the Netherlands.

The territory of Westphalia is an extension of the northern German plain, which here stretches S.E. into an acute angle enclosed on the N.E. by the long low range of the Teutoburger Wald and its southern prolongation the Eggegebirge, and on the S. by the line of hills called the Haarstrang and Harschtrang, which divides the Lippe and Ruhr. There are no high points. The land is a sandy waste called the Senne. The plain is drained into the Rhine by the Lippe, which rise close together in the Teutoburger Wald. Between their basins are the Vechte and other small rivers flowing into the Zuider Zee. The triangular southern portion of Westphalia, most of which is included in Sauerland ("south land"), is a rugged region of slate hills and wooded valleys, drained chiefly by the Ruhr with its afluent the Lenne, Münne, &c., and in the S. by the Sieg and Eder. The hills rise in the S.E. to the Rottläger or Rothargebirge, culminating in the Westfälische Wanne (2713 ft.), the highest summit in the province. The Rothargebirge and the Teutoburger Wald form with some intermediate ranges the watershed between the basin of the Weser and those of the Rhine and Elbe. The western part of the Rhine, the Wiehengebirge from the Wesergebirge by the narrow pass called Porta Westfalica.

The climate is temperate except in the south, which is cold in winter and has much heavy rainfall. Of the total area 43% is covered by cultivated land, of which 21% are meadows, and 26% by forests. The best agricultural land is in the Helling and the Weser basin. The number of peasant proprietors is proportionately greater than in any other part of Prussia, and as a class they are well-to-do. The crops include grain of all kinds (not sufficient, however, for the needs of the province), peas and beans, sugar-beet, potatoes, and pumpkins. The cultivation of corn is very extensive, especially in the E.N.W. Swine, which are reared in great numbers in the plains, yield the famous Westphalian hams; and the growth of lace is of great importance. The breeding of horses is fostered by the government.

The mineral wealth is very great, especially in coal and iron. The production of coal is greater than that of any other province of Prussia, and amounted in 1906 to 53,000,000 tons. The Ruhr coal-field extends from the Rhineland into the province as far as Unna, the centre being Dortmund, and there is a smaller coal-field near N., at Ibbenbüren. The production of iron ore, chiefly S. of the Ruhr, with the districts of Wanne-Eickel, is exceedingly large, and is worked entirely by the Rhine province. After coal and iron the most valuable minerals are zinc, lead, pyrites and copper. Antimony, quicksilver, salt, silver and stone slate are also worked, and there are brine springs in the Helling and mineral springs at Lippespringe, Oyhausen, &c.

The manufacturing industry of the province, which chiefly depends on the mineral wealth, is of considerable importance. Iron and steel goods are produced in the so-called "Enneper Strasse," the valley of the Ennepe, a small tributary of the Ruhr with the town of Hagen, and in the neighbouring towns of Bochum, Dortmund, Iserlohn and Altena, and also in the Siegen district. The brass and bronze industries are carried on at Iserlohn and Altena, those of tin and Britannia metal at Lüdenscheid; needles are made at Iserlohn and wire at Altena. The very important linen industry of Bielefeld, which was founded by the counts of Minden and is still flourishing, the hosiery industry of Minden and Soest, the needle industry of Soest, and the manufacture of linen goods in the W. Paper is extensively made on the lower Lenne, and leather around Siegen. Other manufactures are glass, chemicals, textiles, chemicals, and tobacco. The mining and manufacturing districts of Westphalia are connected by several trunk lines of railway which cross the province (total miles in 1906, 1889 m., exclusive of light railways) and by the navigation of the river Lippe (of which Minden has a port), Ens, Ruhr and Lippe. Beverungen is the chief port for corn and Paderborn for wool.

The population in 1905 was 3,618,090, or 464 sq. m. It is very unevenly distributed, and in the industrial districts is increasing very rapidly. In recent years there has been a great influx of Poles into these parts, attracted by the higher wages. In 1900 they already numbered more than 100,000. Between 1893 and 1900 the mean annual increase of the population was 3.3%, the highest recorded in the German empire, but between 1895 and 1905 it fell to 2.5%. The percentage of illegitimate births (2.6) is the lowest in Germany. 51-9% of the inhabitants are Roman Catholics, 47.9% Protestants. The distribution of the two communities still closely follows the lines of the settlement at the peace of Westphalia. Thus the former duchy of Westphalia and the bishoprics of Münster and Paderborn which remained in ecclesiastical hands are almost entirely Roman Catholic, while the secularized bishopric of Minden and the former counties of Ravensberg and Mark, which fell or had fallen to Brandenburg, and the Siegen district, which belonged to Nassau, are mainly Protestant.

The province is divided into the three government departments (Regierungsbezirke) of Minden, Münster and Arnsberg. Münster is the seat of government and of the provincial university. Westphalia has sent 43 members to the Prussian Lower House and seventeen to the Reichstag.

The inhabitants are mainly of the Saxon stock and speak Low German dialects, except in the Upper Frankish district around Siegen. Here and there the Teutonic dialect is spoken.

Westphalia, "the western plain" (in early records Westfalen), was originally the name of the western province of the early duchy of Saxony, including the western portion of the modern province and extending north to the borders of Friesland. When Duke Henry the Lion of Saxony fell under the ban of the empire in 1180, and his duchy was divided, the bishop of Münster and Paderborn became princes of the empire, and the archbishop of Cologne, Philip of Burgundy, professed as pope the emperor Frederick I. the Sauerland and some other districts were added to the duchy of Westphalia. Within the duchy were some independent secular territories, notably the county of Mark, while other districts were held as fiefs from the archbishops, afterwards electors. From 1368 the electors themselves held the county of Arnsberg as an imperial fief. The duchy received a constitution of its own, and was governed for the elector by a marshal (Landseschall, after 1480 Landdrost) who was also stadholder, and presided over the Westphalian chancellery. This system lasted till 1505. By Maximilian's administrative organization of the empire in 1500 the duchy of Westphalia was included in the appanage of Cologne in the scattered circle of the Lower Rhine. The Westphalian circle which was formed at the same time comprised nearly all the rest of the modern province (including Mark) and the lands north of it between the Weser and the frontier of the Netherlands, also Verden, Schaumburg, Nassau, Wied, Lippe, Berg, Cleves, Jülich, Liège, Bouillon and Cambrai.

Brandenburg laid the foundations of her dominion in Westphalia by obtaining the counties of Mark and Ravensberg in 1314 (confirmed 1666), to which the bishopric of Minden was added by the peace of Westphalia in 1648 and Tecklenburg in 1707. By the settlement of 1803 the church lands were secularized, and Prussia received the bishopric of Paderborn and the eastern part of Münster, while the electoral duchy of Westphalia was given to Hesse-Darmstadt.

After the peace of Tilsit the kingdom of Westphalia was created by Napoleon I. on the 18th of August 1807, and given to his brother Jerome (see Bonaparte). It included the present governmental department of Minden, but by far the larger part of the kingdom lay outside and chiefly to the east of the modern
WESTPHALIA, TREATY OF

province, and comprised the Hanoverian department of Hildesheim and in part that of Arensburg, Brunswick, the northern part of the province of Saxony as far as the Elbe, Halle, and most of Hesse-Cassel. The area was 14,627 sq. m., and the population nearly two millions. Cassel was the capital. A constitution on the French imperial pattern granted by the king remained practically inoperable, an arbitrary bureaucratic régime was instituted, the finances were from the beginning in a hopeless condition, and the country was drained of men and money for Napoleon's wars. In January 1810 most of Hanover was added, but at the end of the same year half the latter, together with the cleared district, was handed over to the French Empire. There had already been serious revolts and raids, and after the battle of Leipzig the Russians drove the king from Cassel (October 1813), the kingdom of Westphalia was dissolved and the old order was for a time re-established. At the congress of Vienna (1815) Hesse-Darmstadt surrendered her share of Westphalia to Prussia, and the present province was constituted.

WESTPHALIA, TREATY OF, a collective name given to the two treaties concluded on the 24th of October 1648 by the empire with France at Münster and with Sweden and the Protestant estates of the empire at Osnabrück, by which the Thirty Years' War (q.v.) was brought to an end.

As early as 1636 negotiations had been opened at Cologne at the instance of Pope Urban VIII., supported by the seigniory of Venice, but failed owing to the disinclination of Richelieu to stop the progress of the French arms, and to the refusal of Sweden to treat with the papal legate. In 1637 the agents of the emperor began to negotiate at Hamburg with Sweden, though the mediation of Christian IV., king of Denmark, was rejected by Sweden, and the discussions dragged on for years without result. In the meantime the new emperor Ferdinand III. proposed at the diet of Regensburg in 1640 to exchange the peace of Prague for the whole empire, on the basis of an amnesty; from which, however, those Protestant estates who were still leagued with foreign powers were to be excluded. His aim was by settling the internal affairs of the empire to exclude the German princes from participation in negotiations with foreign powers; but these efforts had no result.

A more practical suggestion was made by the Comte d'Avaux, the French envoy at Hamburg, who proposed in 1641 that the negotiations at Cologne and Hamburg should be transferred to Münster and Osnabrück, two cities in the Westphalian circle not more than 30 m. apart. A preliminary preliminary treaty had proposed was concluded between the representatives of the emperor, France and Sweden at Hamburg on the 25th of December 1641. A dispute as to precedence between France and Sweden, and the refusal of the latter power to meet the papal nuncio, made the choice of a single meeting-place impossible. It was arranged, however, that the two assemblies should be regarded as a single congress, and that neither should conclude peace without the other.

The date fixed for the meeting of the two conventions was the 29th of July 1643, but not more than six weeks before all the representatives arrived, and the settlement of many questions of precedence and etiquette caused further delays. England, Poland, Muscovy and Turkey were the only European powers unrepresented. The war continued during the deliberations, which were influenced by its fortunes.

The chief representative of the emperor was Count Maximilian von Trautmannslof, to whose sagacity the conclusion of peace was largely due. The French envoys were nominally under Henry of Orleans, duke of Longueville, but the marquis de Sablé and the comte d'Avaux were the real agents of France. Sweden was represented by John Oxenstierna, son of the chancellor, and by John Adler Salvius, who had previously acted for Sweden at Hamburg. The papal nuncio was Fabio Chigi, afterwards Pope Alexander VII. Brandenburg, represented by Count Johann von Sayn-Wittgenstein, played the foremost part among the Protestant states of the empire. On the 1st of June 1645 France and Sweden brought forward propositions of peace, which were discussed by the estates of the empire from October 1645 to April 1646. The settlement of religious matters was left to the decision of the German estates. The peace treaty was signed at Münster by the members of both conventions on the 24th of October 1648, and ratifications were exchanged on the 8th of February 1649. The papal protest of January 3, 1651, was disregarded.

The results were determined in the first place by the support given to each other by France and Sweden in their demands for indemnification, the concession of which necessitated compensation to the German states affected, and secondly by the determination of France to weaken the power of the emperor while strengthening the Roman Catholic states, especially Bavaria. 1646 was the starting-point of the defensive policy of eastern Pomerania with Kiégen and the mouths of the Oder, Wismar and Poel, in Mecklenburg, and the lands of the archbishopric of Bremen and the bishopric of Verden, together with an indemnity of 5,000,000 thalers. The privileges of the Free Towns were preserved. Sweden thus obtained control of the Baltic and a footing on the North Sea, and became an estate of the empire with three deliberative voices in the diet.

The elector of Brandenburg received the greater part of eastern Pomerania, and, as he had a claim on the whole duchy of Saxony, after the death of the last duke in 1635, he was indemnified by the bishoprics of Halberstadt, Minden and Kammin, and the reversion of the archbishopric of Magdeburg, which came to him on the death of the administrator, Prince Augustus of Saxony, in 1680. The elector of Saxony was allowed to retain Lusatia. As compensation for Wismar, Mecklenburg-Schwerin obtained the bishoprics of Schwerin and Ratzeburg and some lands of the Knights of St John. Brunswick-Lüneburg restored Hildesheim to the elector of Cologne, and gave Minden to Brandenburg, but obtained the alternate succession to the bishopric of Osnabrück and the church lands of Walkenried and Großinger. Hesse-Cassel received the prince-abbacy of Hersfeld, the county of Schmückenburg, &c. The elector of Bavaria was confirmed in his possession of the Upper Palatinate, and in his position as an elector which he had obtained in 1623. Charles Louis, the son and heir of Frederick V., the count palatine of the Rhine, who had been placed under the ban of the empire, received back the Lower Palatinate, and a new electorate, the eighth, was created for him.

France obtained the recognition of the sovereignty (which she had enjoyed de facto since 1552) over the bishoprics and cities of Metz, Toul and Verdun, Pinerolo in Piedmont, the town of Breisach, the landgraviate of Upper and Lower Alsace, the Sundgau, the advocacy (Landvogtei) of the ten imperial cities in Alsace, and the right to garrison Philippsburg. During the Thirty Years' War France had professed to be fighting against the house of Austria, and not against the empire. It was stipulated that the immediate possessions of the empire in Alsace should remain in enjoyment of their liberties (in ea libertate et possessione immediatæ erga imperium Romanum, qua haecius gavisse soleat), but it was added as a condition that the sovereignty of France in the territories ceded to her should not be impaired (sic tamen, ut praesentibus declaratrum nihil detractum intelliagatur de eo omni supræmini dominii ture, quod supra concessum est). The intention of France was to acquire the full rights of Austria in Alsace, but as Austria had never owned the landgraviate of Lower Alsace, and the Landvogtei of the ten free cities did not in itself imply possession, the door was left open for disputes. Louis XIV. afterwards avoided himself of this ambiguous clause in support of his aggressive policy on the Rhine. The independence of Switzerland was at last formally
recognized, as was that of the United Netherlands in a separate treaty signed by Spain at Münster.

Apart from these territorial changes, a universal and unconditional amnesty to all those who had been deprived of their possessions was declared, and it was decreed that all secular lands should be restored to those who had held them in 1618. Some exceptions were made in the case of the hereditary dominions of the House of Habsburg.

Even more important than the territorial redistribution was the ecclesiastical settlement. By the confirmation of the treaty of Passau of 1552 and the religious peace of Augsburg of 1555, and the extension of their provisions to the Reformed (Calvinist) Church, toleration was secured for the three great religious communities of the empire. Within these limits the governments were bound to allow at least private worship, liberty of conscience and the right of emigration, but these measures of toleration were not extended to the hereditary lands of the house of Habsburg. The Protestant minority in the imperial diet was not to be coerced by the majority, but religious questions were to be decided by amicable agreement. Protestant administrators of church lands obtained seats in the diet. Religious parity was established in the imperial chamber (Reichskammergericht), and in the imperial deputations and commissions.

The difficult question of the ownership of spiritual lands was decided by a compromise. The edict of restitution of 1629 was annulled. In Württemberg, Baden and the Palatinate these lands were restored to the persons who had held them in 1618 or their successors, but for the rest of the possession was determined by the fact of occupation on the 1st of January 1624 (bonus decretorius or normal year). By the provision that a prince should forfeit his lands if he changed his religion an obstacle was placed in the way of further spread of the Reformation. The declaration that all protests or vetoes by whosoever pronounced should be null and void dealt a blow at the intervention of the Roman curia in German affairs.

The constitutional changes made by the treaty had far-reaching effects. The territorial sovereignty of the states of the empire was recognized. They were empowered to contract treaties with one another and with foreign powers, provided that the emperor and the empire suffered no prejudice. By this and other changes the princes of the empire became absolute sovereigns in their own dominions. The emperor and the diet were left with a mere shadow of their former power. The emperor could not pronounce the ban of the empire without the consent of the diet. The diet, in which the 61 imperial cities gained the right of voting on all imperial business, and thus were put on an equality with the princes, retained its legislative and fiscal powers in name, but practically lost them by the requirement of unanimity among the三级. Its influence, which had been considerable, was diminished, and its decisions by majority of its members, but by agreement between them.

Not only was the central authority replaced almost entirely by the sovereignty of about 300 princes, but the power of the empire was materially weakened in other ways. It lost about 40,000 sq. m. of territory, and obtained a frontier against France which was incapable of defence. Sweden and France as guarantors of the peace acquired the right of interference in the affairs of the empire, and the former gained a voice in its councils. For many years the Holy Roman Empire thus became the principal theatre of European diplomacy and war. But if the treaty of Westphalia pronounced the dissolution of the old order in the empire, it facilitated the growth of new powers in its component parts, especially Austria, Bavaria and Brandenburg.

The treaty was recognized as a fundamental law of the German constitution, and formed the basis of all subsequent treaties until the dissolution of the empire.

For the history, see von Nienhuis, Geschichte der Deutschen Monarchie (2 vols., Berlin, 1850-1851), and History of the German Confederation (1885, 1888). A collection of treatises, partial and official, on the treaty is reproduced in R. J. H. H. (1899).
regiments.” Three buildings had been erected here to house a library, an engineers’ school and a laboratory, and practical experiments in gunnery had been begun here in February 1790. In 1793, at Newburgh, Washington laid before his officers the matter of a military academy such as Knox had suggested. A school for artillers, engineers and cadets of the corps was established here on the president’s recommendation in 1794, and continued until the buildings were destroyed by fire in 1796. In July 1801, Henry Dearborn, Jefferson’s secretary of war, directed that all cadets of the corps of artillers, a subordinate rank which had been established in 1794, should report at West Point for inspection, and in September of that year a school was opened with fifteen cadets. And during the last week of March 1802, President Jefferson approved an act establishing a military academy at West Point, and on the 4th of July it was formally opened with ten cadets present. Acts of 1802 and 1808 authorized 40 cadets from the artillery, 100 from the infantry, 16 from the dragoons and 20 from the riflemen. But few of these were actually appointed, and for several years instruction was disorganized and desultory. In 1811-1812 instruction was practically abandoned, and in March 1812 the “academy” was without a single instructor. Up to this time the state had been able to find only incompetent and unqualified men for the posts of instruction, and at any age between 12 and 34 was accepted. Congress of the 29th of April 1812 reorganized the academy, and laid down the general principles and plan on which it has since been conducted. A maximum of 250 cadets was then authorized. Under the able superintendency of Major Sylvanus Thayer this plan was perfected and put into successful operation. Up to 1843 no territorial requirement was necessary for appointment, but in that year a custom that had grown up of providing for one cadet from each Congressional district, each Territory and the District of Columbia, was embodied in the law.

By acts of 1900, 1902, 1903 and 1908 the Corps of Cadets as now constituted consists of 1200 cadets (appointed on recommendation by members of Congress), one from each Territory, one from the District of Columbia, one from Porto Rico, two from each state at large (on recommendation of the senators), and 40 from the United States at large, all to be appointed by the president. Four Filipinos may also receive instruction and become eligible for graduation on commissions in the Philippine Scouts. The maximum number of cadets under the appointment of the twelfth census was 533. Candidates for admission must be between 17 and 22 years, unmarried, and at least 5 ft. 4 in. high. For entrance there are physical examinations, and examinations in algebra, trigonometry, descriptive geometry, nature, geography and general history. In 1902 the entrance requirements were raised and the actual amount of work done in the academic course increased. The military courses are: tactics for all classes; civil and military engineering (first class); military engineering (fourth, third, second and first classes); mechanics and astronomy (third and second classes); mathematics (new cadets, fourth and third classes); chemistry, mineralogy, geology (third and second classes); drawing (third and second classes); modern languages, i.e. French and Spanish (fourth, third, second and first classes); law (first class); ordnance and gunnery (first class); military hygiene (second class); and English history (new cadets and fourth class). The course is four years, and academic instruction continues from the 1st of September to the 5th of July. The summer months are devoted to field work and encampments. Each cadet while in attendance receives pay at the rate of $800 a year and one ration per day, or commutation thereof at thirty cents per day, amounts to $709.50. The number of graduates from the academy is shown by the following:

The above figures show that the number of graduates from the academy has been comparatively small, and that the number of cadets assigned to the academy has been in proportion.

The annual report shows that the academy is in a sound financial condition, and that the appropriation of $70,000 is ample for the support of the military education of 1200 cadets.

See G. W. Callum, Biographical Register of the Officers and Graduates of the United States Military Academy (1847-1893); E. C. Boynton, History of West Point (1866); J. P. Farley, West Point in the Early Sixties (Troy, 1902); Morris Schaff, Old West Point (Boston, 1907); and the annual reports of the superintendent.

WESTPORT, a market-town, sea-port and seashore resort of County Mayo, Ireland, near the mouth of a small river in Clew Bay, Pop. (1901) 1892. The town is 160 m. W. from Dublin by the Midland Great Western railway, Westport Quay at the river mouth being served by a branch line. There is a small export trade in grain. The beautiful demesne of the marquess of Sligo enriches the neighbourhood. Clew Bay, thickly studded with islands and superb panoramas, is one of the most magnificent of the great inlets on the West. The W. shore of the B. is Clogh Patrick (2510 ft.), an isolated conical hill of singularly perfect form, in wide repute as a place of pilgrimage.

WEST PRUSSIA (Ger. Westpreussen), a province of Prussia, bounded on the N. by the Baltic, on the E. by East Prussia, on the S. by Russian Poland and the province of Posen, and on the W. by Brandenburg and Pomerania. The area is 8062 sq. m. The greater part is occupied by the low Baltic plateau, intersected by a network of streams and lakes, and rising to the forested plateau of Prussian Poland (1806 ft.) at the foot of Konitz is an extensive moorland, 70 m. long, called the Tuchow. The eastern half of the province is traversed by the Oder and its tributaries, and is mountainous. But very numerous, are not large. The Vistula, here of greatest width, and subject to destructive floods, which drain the province near Thorn, and flowing north in a valley which divides the plateau, enters Danzig Bay by a large delta, the Werder. The other rivers are chiefly tributaries of the Vistula, as the Drewenz on its right bank and the Brahe on its left.

In general physical characteristics the province resembles East Prussia, but the climate is less harsh and the fertility of the soil is greater. Arable land and gardens occupy 55.6% of the area, meadows and pastures 12.9%, forests 21.7%, and the rest is covered by heather. In agriculture the province is very large. In the province are small but extensive districts in the north-east, and numerous rice-producing districts in the south. The province is rich in coal and iron, and is a great producer of sugar. The sugar factories and distilleries. Much of the trade passes through the ports of Danzig and Elbing.

The population in 1895 was 1,641,746, showing a mean density of 166 to the sq. m. Of these 567,318 or 34.5% were Poles, a larger proportion than in any other Prussian province except Posen. They are increasing somewhat faster than the Germans, and the Germans are mainly colonizing the northern part of the province, while the immigration of German farmers. The Kashubs (k’s), nearly all of whom (less than 200,000) live in W. Prussia, chiefly in the west, from Pomerania to Konitz, are here reckoned with the Poles. The Poles proper chiefly inhabit the centre of the province, and the borders of Polish Poland. Among the Germans, who are most numerous in the north-east, Low German dialects are spoken, except in a Swabian colony round Kollne. Roman Catholics number 51.4% and Protestants 46.6% of the population, and there are 16,000 Jews. The Poles are almost all Roman Catholics.

The province is divided into the governmental departments of Danzig and Marienwerder, the latter having two-twenty-two members to the Prussian Lower House and thirteen to the Reichstag. Danzig is the capital, and the only large town.

West Prussia, with the exception of southern Pomerania (around Marienwerder) which belonged to Prussia, was a possession of Poland from 1466 till the first partition of Poland in 1772, when it was given to Prussia with the exception of Danzig and Thorn, which Poland retained till 1793. The present province was formed in 1808, but from 1824 to 1878 was united with East Prussia. For its history see also Prussia and Poland.

See C. Lohmyer, Geschichte von Ost- und Westpreussen (part i., 3rd ed., Gotha, 1898); Valfren, Westpreussen seit den ersten Jahrhunderten (Tilsit, 1893); Ambrass, Westpreussen, ein Handbuch der Heimatkunde (Danzig, 1897).

WEST SPRINGFIELD, a township of Hampden county, Massachusetts, U.S.A., on the Connecticut river, opposite Springfield. Pop. (1800) 5077; (1900) 7102 (1910 foreignborn); (1910) 9224. Area, about 18 sq. m. The township is served by the Boston & Albany railway, and by interurban
electric railways to Holyoke and Hartford. The principal villages are Merrick and West Springfield on the Connecticut river and Monticollage on the Westfield river. West Springfield was originally a part of Springfield. The first settlement was not made, however, until about 1655, and there were few settlers until after King Philip's War (1675). In 1666 West Springfield was organized as a separate parish, and in 1774 was made a separate township. Holyoke was set off from it in 1860, and Agawam in 1855.

Climate.—Inasmuch as the state has a range of over 4000 ft. in altitude, the climate varies greatly in different districts. The mean annual temperatures for typical sections are as follows: Ohio Valley, north of the thirty-ninth parallel, 53° F.; south-western part of state, 56°; central plateau district, 53°; mountainous belt along south-eastern boundary of state, 48° to 50°. Wellsburg, in the eastern Panhandle, has a mean of 37°. Martinsburg, in the eastern Panhandle, has nearly the same means, 32° and 74°. Terra incognita, in the north-eastern mountains, has a winter mean of 26°, a summer mean of only 65°. The first killing frosts generally occur about the middle of October in the Ohio Valley region, and about the second of August in the eastern Panhandle. The coldest month in the state is January, and the warmest month is July. The average dates for the last killing frosts in the southern part of the state are the middle and last of April respectively. In the Ohio Valley and eastern Panhandle the summer mean temperature is 74°, the winter mean 46°. The upper plateau, and the margin of the range, is 107°, the lowest-35°. Temperatures above 100° and below-15° are rare. Precipitation is greatest in the mountains, over 50 in.; and least over the Ohio Valley, the eastern Panhandle and the Alleghany Mountain region, 20 in. The snowfall is greatest in the winter, and sometimes deep in the higher plateau and mountain districts. The prevailing winds are from south to west.

Agriculture.—The state is primarily agricultural. The general richer western part is devoted to crops, and the eastern part to raising livestock. The crop of Indian corn in 1909 was 27,632,000 bushels, and the acreage 880,000. The wheat crop was 4,810,000 bushels, and the acreage 5,590,000. The principal districts are the Fairmount (or Upper Monongahela) and the Elk Kark (or Upper Potomac) in the northern, and the Pocahontas (or Flat Top) and the New and Morningstar in the southern counties. The total output of the state was 44,648 tons in 1853, when the first shipments outside the state were made; and 41,887,843 tons (valued at $40,000,054) in 1906, when the output of West Virginia was third in quantity and in value among the states of the Union, being exceeded only by that of Pennsylvania and of Illinois. The forests are principally above water levels and in many cases have been laid bare by erosion; and the supply is varied—besides a fat, cooking, and medicinal kind, there are also cypress, alder, and white pine, and various kinds of oak, hickory, birch, maple, and ash. The bituminous coal, which is by far the most important part of the mineral wealth, is found in the southern part of the state, and is only known in the counties of Kanawha, Marshall, Preston, and Taylor. The total output in 1865-1868 was 3,000,000 bbls. of bituminous coal, valued at $20,000,000, taken out of these districts. A successful well in Marion county, near Charleston, far from the region of the earlier wells, was drilled in 1868, and the output increased to 3,000,000 bbls. in 1888 to 544,115 in 1889, and to 2,406,218 in 1891; in 1893 it was first more than 8,000,000 bbls.; and in 1900 it was 16,165,765. After 1890 it gradually decreased—although new wells in Pocahontas and Marshall counties were found in 1902—and in 1908 it was 9,523,176 bbls. (valued at $16,911,865).

Petroleum ranks second to coal among the state's mineral resources. In 1877 Thomas Jefferson described a 'burning spring' in the Kanawha Valley, and when wells were drilled for salt brine near Charleston petroleum and natural gas were found here before there was any drilling for oil in Pennsylvania. Immediately after the American Civil War, petroleum was discovered in shallow wells near Parkersburg, and there was a great rush of prospectors and speculators to the Little Kanawha Valley. But the Civil War interrupted development. After the war, wells were drilled at Burning Springs, Clarksburg, and several smaller places, and in 1865-1868 there were shipped to the East 2,406,218 bbls. of bituminous coal, valued at $20,000,000, taken out of these districts. A successful well in Marion county, near Charleston, far from the region of the earlier wells, was drilled in 1868, and the output increased to 3,000,000 bbls. in 1888 to 544,115 in 1889, and to 2,406,218 in 1891; in 1893 it was first more than 8,000,000 bbls.; and in 1900 it was 16,165,765. After 1890 it gradually decreased—although new wells in Pocahontas and Marshall counties were found in 1902—and in 1908 it was 9,523,176 bbls. (valued at $16,911,865).

Natural gas, like petroleum, was found before it is so far in West Virginia in central part of the Kanawha, and along the sites of the gas springs on the Big Sandy and the Little Kanawha. In 1841 natural gas was found with salt brine in a well on the Kanawha, and the first well which produced both oil and gas was sunk at Union, West Virginia, and the principal field is in Wetzel county, but there are important supplies in Lewis, Harrison, Marion, Monongahela,
Lincoln and Wayne counties. Much of the natural gas is piped out of the state, to Pennsylvania and Maryland; within the state gas has been utilized as a fuel in carbon black and glass factories.

Brine wells have been mentioned above; the salt industry is small, but there is a production of 1,145,187 bushels produced with a value of $10,184; and there is a small output of bromine. Iron ore is found in the state in the coal hills (especially Laurel Hills and Beaver Lick Mountain), but the deposits have not been commercially worked. Fortunately for the state, the iron would be very difficult to manufacture because of the low price of fuel; in 1909 the value of pig iron manufactured in the state was $6,454,000. There are deposits of excellent iron ore (1,221,119 tons valued at $2,083,821) the state ranked after Ohio and New Jersey in the value of the ore. The total value of all clay products in West Virginia was $3,561,736 in 1908. An excellent glass sand is produced in the middle of the state in Monroe county. Grindstones have been quarried in Wood and Jackson counties. There are black slate deposits near Martinsburg.

There are mineral springs, mostly medicinal waters, in Greenbrier, Summers, Webster, Ohio and Preston counties. Among the more noted medicinal springs are: classed as calcareous and earthy, Sweet Springs, 72°F, in Monroe county, diuretic and diaphoretic; and Berkeley Springs, 74°F, in Morgan county, reputed restorative for nervous and neurotic cases, and as containing sulphur; Salt Sulphur Springs, in Monroe county, of value in scrofula and skin diseases.

Manufactures.—Manufacturing is largely localized in the northwestern districts along the Allegheny and Monongahela rivers. The factory product in 1905 was $99,040,676. The principal manufactures are iron and steel; in 1905 the product of steel works and rolling mills was $3,452,735. The Allegheny and the Ohio Rivers, where the first rolling mill west of the Allegheny Mountains was probably one near Morgantown.

In next importance among the state's manufactures are lumber and timber, and flour and grist mills. There are also foundry and machine works, and leather and leather-goods factories. The state is largely dependent on the plentiful supply of oak and hemlock bark for tanning, is centralized in the northern and eastern parts of the state, near the forests. The glass industry began in Wheeling in 1821, and there was a process discovered by which in 1845, for potash, a silicate of lime and soda was distilled and sold for making glass.

Transportation and Commerce.—Railway development in West Virginia has been due largely to the exploitation of the coal and lumber resources of the state. The Baltimore & Ohio railway leads in trackage: it enters the state with several lines at its northern end; its main line crosses this portion of the state from east to west, striking the Ohio at Parkersburg, and one of its lines (the Ohio River railway) extends nearly the length of the state from Wheeling in the north through Parkersburg to Kenova in the south. This road serves as the main distributary artery of the state. The Chesapeake & Ohio traverses the southern part of the state, from White Sulphur Springs in the east, through Charleston to the Ohio, serving the New and Kanawha rivers coal district as a freight carrier; the Kanawha Valley line and the Kanawha and Ohio rivers extension of the Ohio River railways runs north along the valley of the Big Sandy, carrying coal both east and west from the Pocohontas coal-field; and the new Virginian railway entering at the south-east taps the coal-producing region (the Kanawha and Pocohontas districts) at Deepwater, serving in addition to the Norfolk & Western as a carrier of coal to Norfolk on the Virginia coast. The railway mileage of the state grew with great rapidity in the decade 1880-90; it was 651 mi. in 1880, 1,453 in 1890, 2,473 in 1900 and 3,215 in 1910. Natural facilities for transportation, afforded by the Ohio river and its branches, the Monongahela, at the northern end of the state, and the Little Kanawha and the Great Kanawha, are of special value for the shipment of lumber and coal. The Monongahela has been improved by locks and dams to Fairmont. It is the carrier of a heavy tonnage of coal to Pittsburg, Pennsylvania. The Little Kanawha and Kanawha rivers serve also for the transportation of logs which are floated down to the Ohio.

Population.—The population of West Virginia at the various censuses since its organization as a state has been as follows: 1870, 443,014; 1880, 618,457; 1890, 762,794; 1900, 958,800; 1910, 1,221,119. In 1890-1900 and 1900-1910 the increase in population was more than one fourth. Of the total population in 1900, 07:1% was native-born, 892,854 were native whites, 43,490 were negroes, 56 were Chinese and 12 were Indians. Of the inhabitants born in the United States 61,588 were natives of Virginia, 40,301 of Ohio, 28,057 of Pennsylvania and 25,598 of West Virginia; 5,727 were born in Germany, 6,119 in Ireland, 6,573 Germans, 3,342 Irish, 2,612 Italians and 2,622 English. Of the total population 71,358 were of foreign parentage—i.e. either one or both parents were foreign-born, and 18,323 were of German and 10,534 of Irish parentage, on both the father's and the mother's side.

In 1906 there were in the state 301,656 members of religious denominations, of whom 86:2% were Protestants. The Methodist bodies with 115,932 communicants (38-4% of the total number of church members) are the strongest. There were 67,044 Baptists (2226 United Baptist Churches) and 1,513 Free Baptists; 40,011 Roman Catholics; 19,993 United Brethren, all of the "New Constitution"; 19,668 Tresybrians; 1,332 Disciples of Christ; 6266 Lutherans; and 5320 Protestant Episcopalians. The principal cities of the state are Wheeling, Huntington, Parkersburg, Charleston (the capital), Martinsburg, Fairmont and Grafton.

Administration.—The first constitution of 1863 was superseded by the present instrument which was adopted August 28, 1872 and was amended in 1880, 1895 and 1902. The constitution may be amended by either of two methods: either by a constitutional convention elected for the purpose, or by a majority of the members elected to each house by a majority of the people at a general election to a referendum. Under the present system the latter method is used. The referendum provides that at least two-thirds of each house of the legislature may submit an amendment or amendments to popular vote at the next general election, when the approval of a majority of the voters of the state is necessary. All male citizens above twenty-one years of age have the right of voting. Each elector is entitled to a residence of one year in the state and sixty days in the county in which they offer to vote. Paupers, insane, and those convicted of treason, felony or bribery in an election are barred, "while the disability continues," and no person in the military, naval or marine service of the United States is deemed a resident of the state by reason of being stationed therein. An official blanket ballot containing the names of the candidates arranged in columns according to party is provided at public expense.

Executive.—The executive department consists of the governor, secretary of state, superintendent of public schools, auditor, treasurer, and attorney-general, all elected by the people at the time of the presidential election and serving for four years from the fourth of March following. The governor must have been a citizen for five years preceding this election, must have attained the age of thirty and is ineligible for re-election during the four years succeeding the expiration of his term. In case of the death or resignation of the governor, the lieutenant governor becomes governor. In case of death, resignation or removal for term or disability the governor, the president of the Senate acts as governor, and in case of his incapacity the Speaker of the House of Delegates; and these two failing, the legislature on joint ballot elects an acting governor. A majority of the members of both houses is required for the election, unless the unexpired term is less than one year. The governor appoints, subject to the consent of a majority of the members of the Senate, all citizens who are otherwise appointed, if not otherwise provided for. In case of a vacancy in the court of appeals or in the circuit court the governor appoints until the next general election, or if the unexpired term is less than two years, until the end of the term. The governor sends a message to the legislature at the beginning of each session of the legislature, and may convene the houses in extraordinary session when he deems it necessary. He may veto, or, in case of an appropriation bill, the separate items, but this veto may be overridden by a simple majority of the total membership of each house. Any bill not returned with objections within five days after presentation becomes a law. An appropriation bill cannot be altered by the legislature.

Legislature.—The legislature, consisting of the Senate and the House of Delegates, meets at the capital on the first Wednesday in January of the odd years. The Senate is composed (1910) of thirty members, chosen from districts as nearly equal to each other as the state is divisible, one half the membership retiring biennially. A senator must be twenty-five years of age, and must have been a citizen of the state (total communicants, or members) district for at least six years preceding his election. The Senate elects a president, confirms or rejects the nominations of the governor, and acts as a court of impeachment for the trial of public officers, besides sharing in legislative functions. The House of Delegates is composed (1910) of one hundred and twenty members, of whom each county chooses at least one. A delegate must be a citizen and have resided one year in the county from which he is chosen. No person holding a licentiate office under the state, or United States, nor holding a position of a railroad company, and no officer of any court of record is eligible for membership in either house. Besides its legislative functions the House prepares and impeachment cases, and impeaches and tries the officers of the state. The length of the legislative session is thirty-five days.
WEST VIRGINIA

but it may be extended by a vote of two-thirds of the members elected to each house. No act takes effect until ninety days after its passage unless two-thirds of the members of each house specifically order it to take effect sooner. (See page 563.)

Judiciary.—The judicial power is vested in the Supreme Court of Appeals, the Circuit Courts, such inferior courts as may be established, county courts, the police courts, tax and other courts for the collection of taxes, however, chiefly police and fiscal, and, in justices of the peace. The Supreme Court of Appeals, consisting of five judges, elected for terms of twelve years, holds three terms annually, one at Wheeling, one at Charleston, and one at Charles Town. It has appellate jurisdiction in cases of habeas corpus, mandamus and prohibition, and appellate jurisdiction in cases involving a greater amount than one hundred dollars; and, in all cases in which the title of lands is involved, with the appointment or qualification of personal representatives, guardians, curators, committees, &c., possessing or exercising any of the rights of courts. In order to relieve the circuit courts the legislature has established by special acts inferior courts, generally with criminal jurisdiction only, in nine counties. The judges of these courts, with the appointment of executors, administrators and other personal representatives, and the settlement of their accounts, matters relating to apprentices and to criminal elections for county and district officers. See below under Local Government. One or two justices of the peace (depending on population) are elected from each magisterial district; there must be not less than three, nor more than ten, districts in each county.

Local Government.—As in Virginia, the county is the unit of government, though an unsuccessful attempt to introduce the township system failed. Each county is constituted as a corporation by three commissioners elected for six years but with terms so arranged that one retires every two years, is the police and fiscal authority. Other officers are the clerk of the county court, elected for six years, the sheriff, who also acts as tax-collector and treasurer, the prosecuting attorney, one or two assessors, the surveyor of lands and the superintendent of free schools, all elected for the term of four years; the sheriff may not serve two consecutive full terms. In addition there are county auditors appointed or elected by various authorities and charged with specific duties. They include the local board of health and the board of jury commissioners. Each of the magisterial districts of which a county is comprised (there must be at least three unless the population of each is less than ten in each county) elects one or two magistrates and constables, and a board of education of three members. The constitution provides that the legislature, on the request of any county, may establish a special system of county government, and several of the larger and more populous counties have special acts.

Miscellaneous Laws.—A woman's right to hold, manage and acquire property by marriage even if that union is separated from each other by marriage is protected in the life use of one-third of the real estate and to one-third of the personal state absolutely. If there is no issue she takes the whole of the personal estate, while the real estate goes to her husband. A husband who dies intestate leaves a widow and issue, the widow is entitled to the life use of one-third of the real estate and to one-third of the personal estate absolutely. If there is no issue she takes the whole of the personal estate, while the real estate goes to her husband. If the wife dies intestate the husband has a right to the use of her real estate for life, and to one-third of the personal estate if there is issue. All personal effects of a deceased woman will descend to the right of dower or courtesy in the real estate and of the right to one-third of the personal estate. Children may be disinherited with or without cause. Any parent or infant children of deceased parents may set apart personal estate not exceeding $1,000 for the use and benefit of persons living in the family, but subject to execution. A homestead not exceeding $1,000 in value may be set apart, provided that it is recorded before the deed in which it is conveyed. In the case of a wife the homestead is claimed by contract, or by descent from whites and negroes, or where either party had a wife or husband living, or within the prohibited degrees of consanguinity, or where either was insane or physically incapable of marriage, or where the property was acquired before marriage. There is no provision for female widows or deserted females whose homestead may be annulled. No female or male under twelve years may be employed in mines, and no child under twelve may be employed in a factory, and no woman or girl in any factory nor under six years.

Charities, &c.—The state charitable and penal institutions consist of the West Virginia Hospital for the Insane at Weston, the Second Hospital for the Insane at Spencer, three miners' hospitals—one at Welch, one at McMechen and one at Fairmont; the West Virginia Asylum for Incurables at Huntington, Schools for the Dofl and Blind at Romney, the West Virginia Penitentiary at Moundsville, Hospital for the Incurable at Wheeling, the West Virginia Industrial Home for Girls near Salem. There is also the supervision of a state board of control of three members, appointed by the governor, which was created in 1909, and also has been provided for in the several acts (1878, 1899, 1904) establishing the hospitals above mentioned, a humane society which was organized in 1899 for the protection of children and of the helpless aged, and for the prevention of cruelty to animals. The West Virginia Colored Orphans' Home near Moundsville has been established. It has been chartered and organized under act of the legislature. In 1898 a law was enacted for establishing the West Virginia Children's Home to be under the control of the Home Society.

Education.—Each magisterial district constitutes a school district and there are also a few independent school districts. For each school district there is a board of education consisting of a president and two or more members, usually elected at the time elections are held for county and district officers. The board of education elects a school commissioner every two years. This board is authorized to establish and alter sub-districts. A law enacted in 1908 requires that children between the ages of four and fifteen years of age shall attend school twenty-four weeks each year, provided the public school in their district is in session that length of time. The county supervision of public schools is vested in a county superintendent, who is elected for a term of four years. The state supervision is vested in a state superintendent, who is elected for a term of four years. A state board of education, consisting of the state superintendent and five other persons appointed by him, constitutes a state board of examiners (for special primary, high schools) for the purpose of inspecting educational work in the state. There are also a state school book commission, consisting of the state superintendent and eight other members appointed by the governor. The commissioner is elected by the respective boards of regents of the several institutions (at Huntington, Fairmont, West Liberty, Glenville, Shepherdstown, Athens) and two for negroes (at Institute and at Bluefield). They are governed by a board of regents consisting of the state superintendent and the superintendents of the several institutions. The head of the educational system is the West Virginia University (1867) at Morgantown (q.v.). The principal institutions of higher learning not under state control are Bethany College (Christian, 1848), at Bethany; Morris Harvey College (Methodist Episcopal, Southern, 1888), at Barboursville; West Virginia Wesleyan College (Methodist Episcopal, 1890), at Buckhannon; and Davis and Elkins College (Episcopal, 1895), at Davis. (See Education, Schools and Colleges.)

Finance.—The state revenue is derived mainly from a general property tax, licence taxes levied on various businesses and occupations, a collateral inheritance tax and a capitation tax. For the year ending on the 30th of September 1908 the revenues were $3,122,113 and the disbursements $3,482,317-03. West Virginia's share of the Virginia debt which existed when West Virginia was set off from Virginia has not yet been determined (see below).

History.—That part of Virginia beyond the Allegheny mountains was a favourite haunt of the Indians before the first coming of the whites, and there are many Indian mounds, indicative of an early and high cultural development, within the present limits of the state, and especially in the neighbourhood of Moundsville (q.v.). The western part of Virginia was not explored until long after considerable settlements had been made in the east. In 1671 General Abram Wood, at the direction of Governor William Berkeley (c. 1610–1677), sent a party which discovered Kanawha Falls, and in 1716, Governor Alexander Spotswood with about thirty horsemen made an excursion into what is now Pendleton county. John Van Metre, an Indian trader, penetrated into the northern portion in 1725, and Morgan ap Morgan, a Welshman, built a cabin in the present Berkeley county in the same year. In 1736, John Gano founded New Mecklenburg, the present Shepherdstown, on the Potomac, and others soon followed. Charles II of England, in 1661, granted to a company of gentlemen the land between the Potomac and Rappahannock rivers, commonly known as the "Northern Neck." The grant finally came into the possession of Thomas, Lord Fairfax, and in 1746 a stone was erected at the source of the north branch of the Potomac to mark the western limit of the grant. A considerable part of this land was surveyed by George Washington between 1748 and 1751. The diary kept by the young surveyor indicates that there were already squatters, largely of German origin, along the South Branch of
the Potomac. Christopher Gist, a surveyor, in the employ of the first Ohio Company (see OHIO COMPANY), which was composed chiefly of Virginians, in 1748-1750 explored the country along the Ohio river north of the mouth of the Kanawha, and the company sought to have a fourteenth colony established with the name "Vandalia." Many settlers crossed the mountains after 1750, though they were somewhat hindered by Indian depredations. Probably no Indians lived within the present limits of the state, but the region was a common hunting ground, crossed also by many war trails, and during the French and Indian war (1754-63) the scattered settlements were almost destroyed. In 1774 the governor of Virginia, Lord Dunmore, himself led a force over the mountains, and a body of militia under General Andrew Lewis dealt the Shawnee Indians under Cornstalk a crushing blow at Point Pleasant (g.v.) at the junction of the Kanawha and the Ohio rivers, but Indian attacks continued until after the War of Independence. During the war the settlers in Western Virginia were generally active Whigs and many served in the Continental army.

Social conditions in western Virginia were entirely unlike those existing in the eastern portion of the state. The population was not homogeneous, as a considerable portion of the immigration came by way of Pennsylvania and included Germans, the Protestant sect of the Alleghans. During the War of Independence the movement to create another state beyond the Alleghanies was revived, and a petition (1776) for the establishment of "Westsylvania" was presented to Congress, on the ground that the mountains made an almost impassable barrier on the east. The rugged nature of the country made slavery unprofitable, and time only increased the social, political and economic differences between the two sections of the state. The convention which met in 1839 to form a new constitution for Virginia, against the protest of the counties beyond the mountains, required a property qualification for suffrage, and the slave-holding counties the benefit of three-fifths of their slave population in apportioning the state's representation in the lower Federal house. As a result every county beyond the Alleghanies except one voted to reject the constitution, which was nevertheless carried by eastern votes. Though the Virginia constitution of 1850 provided for white manhood suffrage, yet the distribution of representation among the counties was such as to give control to the section east of the Blue Ridge Mountains. Another grievance of the West was the large expenditure for internal improvements at state expense in the East compared with the scanty proportion allotted to the West. For an account of the Virginia convention of 1861, which adopted the Ordinance of Secession, see VIRGINIA. Here it is sufficient to say that only nine of the forty-six delegates from the present state of West Virginia voted to secede. Almost immediately after the adoption of the ordinance a mass meeting at Clarksburg recommended that each county in northwestern Virginia send delegates to a convention to meet in Wheeling on the 15th of May 1861. When this "First Wheeling Convention" met, four hundred and twenty-five delegates from twenty-five counties were present, but soon there was a division of sentiment. Some delegates advocated the immediate formation of a new state, but the more far-sighted members argued that as the ordinance had not yet been voted upon by the people, and Virginia was still in the Union, such action would be revolutionary, since the United States Constitution provides that no state may be divided without its consent. Therefore it was voted that in case the ordinance should be adopted (of which there was little doubt) another convention including the members-elect of the legislature should meet at Wheeling on the 11th of June. At the election (23rd May 1861) the Whigs, southerners, and people from the counties traversed by the Ohio had a large majority in the state as a whole, but in the western counties 40,000 votes out of 44,000 were cast against it. The "Second Wheeling Convention" met according to agreement (11th June), and declared that, since the Secession Convention had been called without the consent of the people, all its acts were void, and that all who adhered to it had vacated their offices. An act for the "reorganization" of the government was passed on the 19th of June. The next day

Francis H. Pierpont was chosen governor of Virginia, other officers were elected and the convention adjourned. The legislature, composed of the members from the western counties who had been elected on the 23rd of May and some of the holdover senators who had been elected in 1859, met at Wheeling on the 1st of July, filled the remainder of the state offices, organized a state government and elected two United States senators who were recognized at Washington. There were, therefore, two state governments in Virginia, one owning allegiance to the United States and one to the Confederacy. The Convention, which had taken a recess until the 6th of August, then reassembled and (August 20) adopted an ordinance providing for a convention to frame a constitution if the vote should be favourable. At the election (October 24, 1861) 18,489 votes were cast for the new state and only 781 against. The convention met on the 26th of November 1861, and finished its work on the 18th of February 1862, and the instrument was ratified by the people (18,162 for and 571 against) on the 11th of April 1862. Next the legislature of the "Reorganized" government on the 13th of May gave its consent to the formation of the new state. Application for admission to the Union was now made to Congress, and on the 31st of December 1862 an enabling act was approved by President Lincoln admitting the state on the condition that the gradual abolition of slavery be inserted in the Constitution. The Convention was reconvened on the 12th of February 1863, and the demand of Congress was met. The revised instrument was adopted by the people on the 26th of March 1863, and on the 20th of April 1863 President Lincoln issued a proclamation admitting the state at the end of sixty days (June 20, 1863). Meanwhile officers for the new state were chosen, and Governor Pierpont removed his capital to Alexandria where he asserted jurisdiction over the counties of Virginia within the Federal lines. The ordinance of secession of the new state was brought before the Supreme Court of the United States in the following manner. Berkeley and Jefferson counties lying on the Potomac east of the mountains, in 1863, with the consent of the "Reorganized" government of Virginia voted in favour of annexation to West Virginia. Many voters absent in the Confederate army when the vote was taken refused to acknowledge the transfer on their return. The Virginia legislature repealed the act of cession and in 1866 brought suit against West Virginia asking the court to declare the counties a part of Virginia. Meanwhile Congress on the 10th of March 1866 passed a joint resolution recognizing the transfer. The Supreme Court in 1871 decided in favour of West Virginia, and there has been no further question. During the Civil War West Virginia suffered comparatively little. McClellan's forces gained possession of the greater part of the territory in the summer of 1861, and Union control was never seriously threatened, in spite of Lee's attempt in the same year. In 1863 General John D. Imboden, with 5000 Confederates, overran a considerable portion of the state. Bands of guerrillas burned and plundered in some sections, and were not entirely suppressed until after the war was over. The state furnished about 80,000 soldiers to the Federal armies and sustained a loss of less than 10,000 to the Confederate forces. The absence in the army of the Confederate sympathizers helps to explain the small vote against the formation of the new state. During the war and for years afterwards partisan feeling ran high. The property of Confederates might be confiscated, and in 1866 a constitutional amendment disfranchising all who had given aid and comfort to the Confederacy was adopted. The addition of the Fourteenth and Fifteenth Amendments to the Constitution created a reaction, the Democratic party secured control in 1870, and in 1871 the constitutional amendment of 1866 was abrogated. The first steps toward this change had been taken, however, by the Republicans in 1870. In 1872 an entirely new constitution was adopted (August 22).

Though the first constitution provided for the assumption of a part of the Virginia debt, negotiations opened by Virginia in 1870 were fruitless, and in 1871 that state funded two-thirds of the debt and arbitrarily assigned the remainder to West Virginia.
The legislature of the latter state in 1873 adopted a report declaring that between 1822 and 1861, during which period the debt had been incurred, the western counties had paid an excess of taxes, more than equal to the amount which had been expended in the west for the purposes for which the debt had been incurred, and concluded with the statement: "West Virginia owes the bonds for sale and asks no help." In 1866 Virginia entered suit in the U.S. Supreme Court to compel West Virginia to assume a portion of the debt. West Virginia demurred, but was overruled, and on the 4th of May 1908 a master was appointed to take testimony. The state rejected decisively the overtures made by Virginia in 1866, looking towards a reunion of the commonwealths.

Fast and Hu Maxwell, History and Government of West Virginia (Morgantown, 1901; new edition, 1903); A. S. Withers, Chronicles of Border Warfare (1831, reprinted Cincinnati, 1900); T. F. Hale, Trans-Allegheny Piombo (Cincinnati, 1898); W. P. Willson, Constitution of West Virginia (Wheeling, 1901); and M. F. Callahan, Evolution of the Constitution of West Virginia (Morgantown, 1909).

WESTWARD HO, a small seaside village in the Barnstable parliamentary division of Devоshire, England, on the east of Barnstaple Bay, 2 3/4 m. N.W. of Bideford, on the Bideford and Appledore railway, which takes its name from a famous novel by Charles Kingsley. Many visitors are attracted in summer by its pure and bracing air, its quiet, and, above all, by its golf club, with links laid out on the sandhills known as Braunton Burrows. Westward Ho forms part of the urban district of Northam, which had a population in 1901 of 5155.

WETHERSFIELD, a township of Hartford county, Connecticut, U.S.A., on the Connecticut river, adjoining on the N. the city of Hartford, of which it is a residential suburb. Pop. (1900) 2271; (1900) 2200, (1900) 4220 and (1900) 3148; Area, about 12 sq. m. It is served by the New York, New Haven & Hartford railway and by electric lines to Hartford. Among its old buildings are the house in which in 1781 George Washington and Count Rochambeau met to plan the Yorktown campaign; the First Church of Christ (Congregational), erected in 1761 and remodelled in 1838 and 1882; and the old academy building, which was built in 1802, is now used as a town hall, and houses a public library. There is a great elm here, 26 1/2 ft. in girth. The Connecticut state prison is in Wethersfield. In the township tobacco, vegetables, and dairy produce are raised, and dairying interests are of considerable importance; the principal manufactures are small tools and mattresses. Wethersfield is the oldest permanently inhabited township in the state; it was first settled in the winter of 1634-1635 by colonists from Watertown, Massachusetts, and received its present name in 1637. With Hartford and Windsor in 1639 it formed the Fundamental Orders of the Colony of Connecticut. Before 1660 its inhabitants aided in the founding of Stamford and Milford, Connecticut, and of Hadley, Massachusetts.

See H. R. Stiles, History of Ancient Wethersfield (New York, 1900).

WETSTEIN (also WETSTEIN), JOHANN JAKOB (1693-1754), New Testament critic, was born at Basel on the 6th of March 1693. Among his tutors in theology was Samuel Werenfels (1657-1740), an influential anti-racism of modern scientific exegesis. While still a student he began to direct his attention to the special pursuit of his life—the text of the Greek New Testament. A relative, Johann Wetstein, who was the university librarian, gave him permission to examine and collate the principal MSS of the New Testament in the library, and he copied the various readings which they contained into his copy of Gerard of Maestricht's edition of the Greek text. In 1733 in his public examination he defended a dissertation entitled De variis Novi Testamenti lectionibus, and sought to show that variety of readings did not detract from the authority of the Bible. Wetstein paid great attention also to Aramaic and Talmudic Hebrew. In the spring of 1714 he undertook a learned tour, which led him to Paris and England, the great variety of his inquiry everywhere being manuscripts of the New Testament. In 1717 he returned to Basel, and there submitted his dissertation on R. Bentley at Cambridge, who took great interest in his work. The great scholar induced him to return to Paris to collate carefully the Codex Ephraemi, Bentley having then in view a critical edition of the New Testament. In July 1717 Wetstein returned to take the office of a curate at large (diasconus communis) at Basel, a post which he held for three years, at the expiration of which he exchanged it to become his father's colleague and successor in the parish of St Leonard's. At the same time he kept his favourite study, and gave private lectures on New Testament exegesis. It was then that he decided to prepare a critical edition of the Greek New Testament. He had in the meantime broken with Bentley, whose famous Proposals appeared in 1720. His earlier teachers, however, J. C. Iselin and J. L. Frey, who were engaged upon work similar to his own, became so unfriendly towards him that after a time he was forbidden any further use of the manuscripts in the library. Then a rumour got abroad that his projected text would take the Socinian side in the case of such passages as 2 Timothy iii. 16; and in other ways (e.g. by regarding Jesus's temptation as a subjective object), which, as he himself expressed it, he had given occasion for the suspicion of heresy. At length in 1729 the charge of projecting an edition of the Greek Testament favourable to Arian and Socinian views was formally laid against him. The end of the long and unedifying trial was his dismissal, on the 13th of May 1730, from his office of curate of St Leonard's. He then removed from Basel to Amsterdam, where a relative, Johann Heinrich Wetstein, had an important printing and publishing business, from whose office excellent editions of the classics were issued. He undertook the printing of Gerard of Maestricht's edition of the Greek Testament. Wetstein had begun to prepare this, when he was called upon to prepare an edition of the Greek Testament, which was suddenly stopped for some unknown reason. As soon as he reached Amsterdam he published anonymously the Prolegomena ad Novi Testamenti Graeci editionem, which he had proposed should accompany his Greek Testament, and which was republished by him, with additions, as part of his great work, 1751. The next year (1752) the Remonstrants offered him the chair of philosophy in their college at Amsterdam, vacated by the illness of Jean le Clerc, on condition that he should clear himself of the suspicion of heresy. He thereupon returned to Basel, and received a reversal (March 22, 1752) of the previous decision, and admission to all his clerical offices. But, on his becoming a candidate for the Hebrew chair at Basel, his orthodox opponents procured his defeat and his retirement to Amsterdam. At
The family of Wettin, which he recommended to place a textus receptus and the full list of various readings. Beneath the latter passages are many critical and methodical accounts of the MSS. and the readings of the fathers, as well as the work, the difficulties with which the text has to contend in the prosecution of the work of his life. He was the first to designate uncial manuscripts by Roman capitals, and cursive manuscripts by Arabic figures. He did not live long enough to complete this work. He died at Amsterdam on the 23rd of March 1754.

Wettin's New Testament has never been republished entirely. The edition of 1756, by William Baker, published in parts, is in which he introduced the readings recommended by Wettin; J. G. Semler republished the Prolegomena and appendix (1762); A. Loizeau commenced a new edition of the work, but the Prolegomena were not issued. The editor of the works of Wettin is generally allowed that Wettin rendered invaluable service to textual criticism by his selection of various readings and his methodical account of the MSS. and other sources, and that his work was rendered less valuable through his prejudice against the Latin version and the principle of grouping MSS. in families which had been recommended by Richard Bentley and J. A. Bengel.

WETTIN—WEXFORD

Wetin, the name of a family from which several of the royal houses of Europe have sprung, derived from a castle which stood near the small town of that name on the Saale. Attempts to trace the descent to the Saxon chief Widukind or Wittkeke, who wielded influence in the latter part of the 10th century. Dietrich, who was count of Hesse or Housay, a district on the left bank of the Saale. Dietrich was killed in 982 fighting the Hungarians, and his sons Dedo I. (d. 1000) and Frederick (d. 1017) received lands taken from the Wends, including the county of Gosau of Wettin on the right bank of the Saale. Dedo's son Dietrich II. inherited these lands, distinguished himself in warfare against the Poles, and married Matilda, daughter of Eckard I., margrave of Meissen. Their son Dedo II. obtained the Saxon east mark and lower Lusatia on the death of his uncle Eckard II. margrave of Meissen, in 1016, but in 1060 he quarrelled with the emperor Henry IV. and was compelled to surrender his possessions. He died in 1075, and his lands were granted to his son Henry I., who in 1089 was invested with the mark of Meissen. In 1103 Henry was succeeded by his cousin Thimo (d. 1104), who built a castle at Wettin, and was called by this name. Henry II., son of Henry I., followed, but died childless in 1123; his cousin, Conrad I., son of Thimo, claimed Meissen, of which he secured possession in 1130, and in 1135 the emperor Lothair II. added lower Lusatia to his possessions. Abolishment in the 12th century, William's lands were divided between his five sons, when the county of Wettin fell to his fourth son Henry, whose family died out in 1217. Wettin then passed to the descendants of Conrad's youngest son Frederick, and in 1288 the county, town and castle of Wettin were sold to the archbishop of Magdeburg. They were retained by the archbishop until the peace of Westphalia in 1648, when they passed to the eleventh of Brandenburg, and afterwards became incorporated in the kingdom of Prussia.

Conrad I. and his successors had added largely to their possessions, until under Henry I., the Illustrious, margrave of Meissen, the lands of the Wettins stretched from the Oder to the Werra, and from the Erzgebirge to the Harz mountains. The subsequent history of the family is merged in that of Meissen, Saxony and the four Saxon dukedoms. In June 1880 the 800th anniversary of the rule of the Wettins in Meissen and Saxony was celebrated with great splendour at Dresden.

Posse, Die Markgrafen von Meissen und das Haus Wettin (Leipzig, 1881); K. Wenck, Die Wettiner im 14ten Jahrhundert (Leipzig, 1877); Kämmel, Festschrift zur 800 jährigen Jubiläum der Häuser Wettin (Leipzig, 1889); and H. T. Meyer, Hof- und Zentralverwaltung der Wettiner (Leipzig, 1902).

WETZLAR, a town of Germany, in the Prussian Rhine province, pleasantly situated at the confluence of the Dill and Lahn, 64 m. N.E. of Coblenz by the railway to Giessen. Pop. (1905) 12,776. The most conspicuous building is the cathedral, dating in part from the 11th, in part from the 14th-16th centuries. The municipal archives contain interesting documents of the whilom imperial chamber (see infra). The town preserves associations of Goethe in 1772. After living here in 1772 as a legal official, and of Charlotte Buff, the Lotte of Werther. Overlooking the town are the ruins of the medieval castle of Kalsmunt. There are iron mines and foundries and optical instrument factories. Wetzlar was originally a royal demesne, and in the 12th century became a free imperial town. It had grown in importance when, in 1603, the imperial chamber (Reichskammergericht) was removed hither from Spires. The town lost its independence in 1803, and passed to the prince-primate Dalberg. Three years later (1806), on the dissolution of the empire, the imperial chamber ceased to exist. The French occupied here the palaces of Wettins and Saxons under the archduke Charles, 15th June 1796.

WEXFORD, a county of Ireland in the province of Leinster, bounded N. by Wicklow, E. and S. by St George's Channel, and W. by Waterford, Kilkenny and Carlow. The area is 576,737 acres or about 902 sq. m. The coast-line does not present any striking features, and owing to the number of sandbanks navigation is dangerous near the shore. The only inlet of importance on the east coast and the only safe harbour is Wexford Harbour, which, owing to a bar, is not accessible to large vessels at ebb-tide. The artificial harbour of Rosslare, after living here in 1772 as a legal official, and of Charlotte Buff, the Lotte of Werther. Overlooking the town are the ruins of the medieval castle of Kalsmunt. There are iron mines and foundries and optical instrument factories. Wetzlar was originally a royal demesne, and in the 12th century became a free imperial town. It had grown in importance when, in 1603, the imperial chamber (Reichskammergericht) was removed hither from Spires. The town lost its independence in 1803, and passed to the prince-primate Dalberg. Three years later (1806), on the dissolution of the empire, the imperial chamber ceased to exist. The French occupied here the palaces of Wettins and Saxons under the archduke Charles, 15th June 1796.

The surface of the county is chiefly a series of verdtant low hills, except towards the northern and western boundaries. An elevation, rising on the north-western boundary forms the termination of the granitic range in Wicklow, and in Croghan Kinshela, on the borders of Wicklow, rises to a height of 1085 ft. On the western border, another range, situated chiefly in Carlow, extends from the valley of the Slaney at Newtownbarry to the confluence of the Barrow with the Nore at New Ross, and reaches 2400 ft. in Blackstairs Mountain, and 2610 ft. in Mount Leinster on the border of Co. Carlow. In the southern district, a hilly region, reaching in Forth Mountain a height of 725 ft., forms with Wexford Harbour the northern boundaries of the baronies of Fonth and Bangy, a peninsula of flat and fertile land. The river Slaney enters the county at its north-western extremity, and flows south-east to Wexford Harbour. Its chief tributary is the Bann, which flows south-westwards from the borders of Wicklow. The Barrow forms the western boundary of the county from the Blackstairs range of mountains till its confluence with the Suir at Waterford Harbour.
Geology.—The Leinster Chain, with its granite core and margin of mica-schist, bounds the county on the west. From this, Silurian greywacke sea, like that forming with the Palaeozoic surface, numerous intrusive and contemporaneous felsic lavas, and some diorites occurring along the strike in continuation of the Waterford series. A granite outlier rises south of Enniscorthy; and granite, in part gneissic, forms Carrsore Pt. From near Courtown to Bannow Bay, greenish slates like the Oldhamian series of Wicklow form a broad band, with Old Red Sandstone and Carboniferous limestones on either side. The plant bed is well held, as at Cornelscourt, SIlurian near New Ross, and again towards Carnsore. The surface of the county is much modified by glacial drift, and by the presence of sands and gravels of pre-Glacial and possibly late Pleistocene age. These interesting beds, are used for liming the fields, under the name of “manure gravels,” on account of the fossil shells that they contain.

Industries.—The soil for the most part is a cold stiff clay resting on a layer of peat. Hay-plots and grass fields are much more numerous here than to the south of the county, and there are a few fishing villages on the inlets of the south coast.

The Dublin & South-Eastern railway enters the county from N.E., and runs to Wexford by way of Enniscorthy, with a branch W. to New Ross, from Macmine Junction. Connecting with this line at Palace East, a branch of the Great Southern & Western joins the Kilkenny & Cashel line at Kilkenny town, county Carlow. This company also owns the lines from Rosslare harbour to Wexford and across the southern part of the county to Waterford. There is water communication for barges by the Slaney to Enniscorthy; by the Barrow for larger vessels to New Ross, and by this river and the Grand Canal for barges to Dublin.

Population and Administration.—The population decreases (112,063 in 1891; 104,104 in 1901), but this decrease and the emigration returns are less serious than the average of Irish counties. Of the total about 91 1/2% are Roman Catholics, and about 8 1/2% form the rural population. The principal towns are Wexford (pop. 13,768), New Ross (3,847), Enniscorthy (3,458) and Gorey (2,718). Newtownbarrny, finitely situated on the Slaney below the outliers of Mount Leinster, is a lesser market town. To the Irish parliament, until the Union of 1800, the county returned two members, and the boroughs of Bannow, Clonmines, Enniscorthy, Fethard, Gorey, New Ross, Taghmon and Wexford two each. By the Redistribution Act of 1885 Wexford, which had returned two members since 1800, was divided into two parliamentary divisions, North and South, each returning one member, the borough of Wexford, which formerly returned two, being retained, and the portion of the county of Wexford retained within the county, being merged in the South Division. The county is divided into ten baronies. It is in the Protestant diocese of Dublin, and the Roman Catholic dioceses of Dublin, Ferns, and Kildare and Leighlin. Assizes are held at Wexford, and quarter sessions at Enniscorthy, Gorey, New Ross and Wexford.

History and Antiquities.—The northern portion of Wexford was included in Hy Kinseleagh, the peculiar territory of the Macmorrowes, overlords of Leinster, who had their chief residence at Ferns. Dermot Macmorrow, having been deposed from the high-kingship of Leinster, fled to England, and was named king of England, who authorized him to raise forces in England for the assertion of his claim. He secured the aid of Strongbow by promising him the hand of Eva, and in addition obtained assistance from Robert Fitzstephen and Maurice Fitzgerald of Wales. On the 1st of May 1169 Fitzstephen landed at Bagenon on the south side of Fethard, and after four days' siege captured the town of Wexford from its Danish inhabitants. After this Dermot granted the territory of Wexford to Fitzstephen and Fitzgerald and their heirs for ever. Macmorrow having died in 1171, his son, the he-ir of Wexford, retained Wexford in his own possession, but in 1174 he committed it to Strongbow. The barony of Foy is almost entirely peopled by the descendants of those who accompanied these English expeditions. Wexford was one of the twelve counties into which the conquered territory in Ireland is generally stated to have been divided by King John, and formed part of the possessions of William Marshal, earl of Pembroke, who had married Strongbow's daughter. Through the female line it ultimately passed to John Talbot, earl of Shrewsbury, who in 1446 gave Wexford and radiiis of Dunbrody, Enniscorthy and New Ross. Among the monastic ruins special mention may be made of Dunbrody abbey, of great extent, founded about 1178 for Cistercian monks by Hervey de Montmorency, marshal of Henry II.; Tintern abbey, founded in 1200 by William Marshal, earl of Pembroke, and peopled by monks from Tintern abbey in Monmouthshire; the abbey of St Sepulchre, Wexford, founded shortly after the invasion by the Irish king John, and by the monks of the abbey of Macmorrow (with other remains including the modernized cathedral of a former see, and ruins of a church); and the abbey of New Ross, founded by St Alban in the 6th century. There are a considerable number of old castles, including Ferns, dindsay by the line at Ballinacourty, county Carlow.

WEXFORD, a seaport, market town and municipal borough, and the county town of Co. Wexford, Ireland, finely situated on the south side of the Slaney, where it discharges into Wexford Harbour, on the Dublin & South-Eastern railway, 924 m. S. of Dublin. Pop. (1901) 11,166. Wexford Harbour, formed by the estuary of the Slaney, is about 5 m. from N. to S. and about 4 from E. to W. There are quays extending nearly 900 yds., and the harbour affords good accommodation for shipping, but its advantages are in great part lost by a bar at its mouth preventing the entrance of vessels drawing more than 12 ft. An artificial harbour was therefore opened at Rosslare in 1906, outside the southern part of the promontory closing in the harbour, and this is connected with Wexford by a railway (8 m.) owned by the Great Southern & Western Company, and is served by the passenger steamers of the Great Western railway of England from Fishguard. The town of Wexford consists, for the most part, of extremely narrow streets, of picturesque appearance, but inconvenient to traffic. Some remains exist of the old walls and flanking towers. The Protestant cathedral, on the site of the ancient abbey of St Sepulchre or Selsker, is said to occupy the spot where the treaty was signed between the Irish and the English invaders in 1169. The principal modern buildings are the town-hall, court-house, barracks, occupying the site of the ancient castle, St Peter's College for the education of Catholic clergy, with a striking chapel by A. W. Pugin, and a number of convents. At Carrick: 2 m. W., the Anglo-Normans erected their first castle, and opposite this, across the river, is a modern round tower commemorating the men of Wexford who died in the Crimean War. At Carrick are three monuments erected in the 15th century, by the abbey of St Sepulchre or Selsker. The town has a large distillery for the manufacture of artificial manure, flour, agricultural implements, and rope and twine. Wexford is the headquarters of salmon and sea fishery districts. Under the Local Government (Ireland) Act 1898 it retains its mayor and corporation.

Wexford was one of the earliest colonies of the English, having been taken by Fitzstephen. It was the second town that Cromwell besieged in 1649. It was garrisoned for William III. in 1690, and occupied by the French in 1798 and 1803. It was used as a military base by the French, but, however, surrendered it on the 21st of June. In 1378 the town received a charter from Aymer de Valence, which was extended by Henry IV. in 1411, and confirmed by Elizabeth in 1558.
By James I. it was in 1608 made a free borough corporate, by the title of the town and free borough corporate of Weyford. It returned two members to parliament from 1374 till the Union, when they were reduced to one. In 1885 it was included in the south division of the county.

WEYBRIDGE, an urban district in the Chertsey parliamentary division of Surrey, England; 19 m. W.S.W. from London by the London & South-Western railway. Pop. (1901) 5320. It lies in the flat valley of the river Wey, 1 m. above its junction with the Thames. The river is locked up to Godalming, and navigation is assisted by cuts. Weybridge has grown in modern times out of a village into a residential town. The church of St. James is modern but contains numerous ancient memorials, and one by Sir F. Chantrey for the duchess of York (d. 1829), daughter of Frederick William II. of Prussia, to whose memory there is also a column on Weybridge Green. The summit of this column is that which formerly stood at Seven Dials, London. The Roman Catholic chapel of St. Charles Borromeo was the burial-place of Louis Philippe, ex-king of the French (d. 1850), who resided at Claremont in the neighbouring parish of Esher, his queen and other members of his family; but their bodies were subsequently removed to Dreux in Normandy. To the east of Weybridge lies Henry VIII.'s park of Oatlands (see Walton-on-Thames). In 1907 the Brooklands racing track for motor-cars was opened near Weybridge. It has a circuit of 2½ m. round the inner edge, and including the straight finishing track is 100 m. long and 7 m. wide. The total length is about 3000 ft., and at the curves it is banked up to a maximum height of 28 ft. 8 in.

WEYDEN, ROGIER VAN DER [originally ROGER DE LA PASTURE] (c. 1400-1464), Flemish painter, was born in Tournai, and there apprenticed in 1427 to Robert Campin. He became a gold master in 1432 and in 1435 removed to Brussels, where he was shortly after appointed town painter. His four historical works in the Hôtel de Ville have perished, but three tapestries in the Bern museum are traditionally based on their designs. In 1449 Rogier went to Italy, visiting Rome, Ferrara (where he painted two pictures for Lionello d'Este), Milan and probably Florence. On returning (1450) he executed for Pierre Bladelin the "Magi" triptych, now in the Berlin Gallery, and (1453) an altarpiece for the abbey of Cambrai, which has been identified with a triptych in the Prado Gallery representing the "Crucifixion," the "Expulsion from Paradise" and the "Last Judgment." Van der Weyden's style, which was in no way modified by his Italian journey, is somewhat dry and severe as compared with the painting of the Van Eycks, whose pupil Vasari erroneously supposed him to be; his colour is less rich than theirs, his brush-work more laborious, his sense of form more exact. On the other hand, he cared more for dramatic expression, particularly of a tragic kind, and his pictures have a deeply religious intention. Comparatively few works are attributed with certainty to this painter; chief among such are two altarpieces at Berlin, besides that mentioned above, "The Joys and Sorrows of Mary," and "Life of St John the Baptist," a "Deposition" and "Crucifixion" in the Escorial, the Prado triptych, another ("Annunciation," "Adoration" and "Presentation") at Munich; a "Madonna" and a "St John the Baptist" at Frankfort. The "Seven Sacraments" altarpiece at Antwerp is almost certainly his, likewise the "Doom" in the Capella della triptych of the Beaune hospital, and the "Seven Sorrows" at Brussels. Two pictures of St Luke painting the Virgin, at Brussels and St Petersburg respectively, are attributed to him. None of these is signed or dated. Van der Weyden attracted many foreigners, notably Martin Schongauer, to his studio, and he became one of the main influences in the northern art of the 15th century. He died at Brussels in 1464. His descendant, ROGIER VAN DER WEYDEN the younger, is known to have entered the Antwerp guild in 1528, but no work of his has yet been satisfactorily authenticated.

See Hasse, Roger von der Weyden and Roger von Brugge (Strassburg, 1905).

WEYLER Y NICOLAU, VALERIANO, Marques of Tenerife (1837— ), Spanish soldier, was born at Palma de Majorca. His family were originally Prussians, and served in the Spanish army for several generations. He entered at sixteen the military college of Cadiz, and, when he obtained the rank of lieutenant, passed into the staff college, from which he came out as the head of his class. Two years afterwards he became captain, and was sent to Cuba at his own request. He distinguished himself in the expedition to Santo Domingo in many fights, and especially in a daring reconnaissance with few men into the heart of the enemy's lines, for which he got the cross with laurels of San Fernando. From 1868 to 1872 he served also brilliantly against the Cuban rebels, and commanded a corps of volunteers specially raised for him in Havana. He returned to Spain in 1873 as brigadier-general, and took an active part against the Carlists in the eastern provinces of the Peninsula in 1873 and 1876, for which he was raised to the rank of general of division. Then he was elected senator and given the title of marques of Tenerife. He held the post of captain-general in the Canary Islands from 1875 to 1883, and in the Balearic Islands afterwards. In 1888 he was sent out as captain-general to the Philippines, where he dealt very sternly with the native rebels of the Carolines, of Mindanao and other provinces. On his return to Spain in 1892 he was appointed to the command first of the 6th Army Corps in the Basque Provinces and Navarre, where he put down quelling several agitations, and then as captain-general at Barcelona, where he remained until June, 1897. In Catalonia, with a state of siege, he made himself the terror of the anarchists and socialists. After Marshal Campos had failed to pacify Cuba, the Conservative government of Canovas del Castillo sent out Weyler, and this selection met the approval of most Spaniards, who thought him the proper man to crush the rebellion. Weyler attempted to do this by a policy of inexorable repression, which raised a storm of indignation, and led to a demand from America for his recall. This recall was granted by the Liberal government of Sagasta, but Weyler afterwards asserted that, had he been left alone, he would have stamped out the rebellion in six months. After his return to Spain his reputation as a strong and ambitious soldier made him one of those who in case of any constitutional disturbance might be expected to play an important rôle, and his political position was nationally affected by this consideration; his appointment in 1900 as captain-general of Madrid resulted indeed in more than one ministerial crisis. He was minister of war for a short time at the end of 1901, and again in 1905. At the end of October 1909 he was appointed captain-general at Barcelona, but he died after a few weeks in the house of his friend, the Marquess of Francisco Ferrer were quelled by him without bloodshed.

WEYMAN, STANLEY JOHN (1852— ). English novelist, was born at Ludlow, Shropshire, on the 7th of August 1855, the son of a solicitor. He was educated at Shrewsbury School, and at Christ Church, Oxford. He took his degree in modern history in 1877, and was called to the bar at the Inner Temple in 1881, joining the Oxford circuit. He had been practising as a barrister for eight years when he made his reputation as a novelist by a series of romances dealing with French history: The House of the Wolf (1886); A Gentleman of France (1893); Under the Red Robe (1894); Memoirs of a Minister of France (1895), &c. Among his later novels were: Shrewsbury (1897), The Castle Inn (1898), Sophia (1900), Count Honnibal (1901), In King's Byways (1902), The Long Night (1903), The Abbess of Vlaye (1904), Starcross Farm (1905), Chipping (1906).

WEYMOUTH, a township of Norfolk county, Massachusetts, U.S.A., on Weymouth harbour, a part of Boston Bay, 9 m. S.E. of Boston, between Quincy and Braintree (to the W.) and Hingham to the E. Pop. (1850) 10,866; (1900) 11,342 (1845 foreign-born); (1905, state census) 11,585; (1910) 11,695. Area, 10 sq. m. Weymouth is served by the New York, New Haven & Hartford railway, and is connected with Boston, Quincy, Braintree, Hingham, Nantasket and Rockland by electric lines. In the township there are several villages, including Weymouth, North Weymouth, East Weymouth and South
WEYMOUTH—WHALE

Weymouth, and the smaller villages of Weymouth Centre, Weymouth Heights, Lovell's Corner, Nash's Corner and Old Spain, and there are also four islands, Round, Grape, Slate and Sheep. The mainland itself is largely a peninsula lying between the Weymouth Fore river and the Weymouth Back river, to the west and east respectively. The surface of the country is rough: Great Hill (at one of the narrowest parts of the peninsula) is about 200 yds. above the river, in the township of South Weymouth (1586, in South Weymouth) founded by a bequest of John S. Fogg; and the Tufts Library (1819, in Weymouth village), endowed by Quincy Tufts and his sister Susan Tufts. In 1905 the township's factory products were valued at $4,021,055, of which $2,388,213, or 52.6% of the total, was the value of boots and shoes. The township owns and operates its water works; the water supply is obtained from Weymouth Great Pond in the village of South Weymouth. Weymouth was first settled in 1623 by Robert Gorges. It was known first as the Plataation of Wessagus or Wessagusset; was incorporated as a township in 1635, and its boundaries have been practically unchanged since 1637, when Round and Grape islands were granted to Weymouth.

See C. F. Adams, Jr., "Wessagusset and Weymouth" in No. 3 (1905) of the Publications of the Weymouth Historical Society (organized in 1879 and incorporated in 1886), and D. H. Hurst, History of Norfolk County (Boston, 1884).

WEYMOUTH and MELCOMBE REGIS, a seaport, watermg-
place, market town and municipal borough in the Southern parlia-
mentary division of Dorsetshire,ß. 142. m. S.W. by W. from London, on the English Channel and Great Western railways. Pop. (1891) 16,100; (1901) 19,843. It is formed of Weymouth, a fishing town and seaport on the south-
west of the Wey, and Melcombe Regis on the north-east of the river, the two towns being contiguous. The situation on Wey-
mouth Bay, which is enclosed to the south by the Isle of Portland, and north by the eastward trend of the coast, is picturesque. An esplanade about 1 m. in length fronts the sea. To the south of the esplanade is a pier of stone on wooden piles, and the Alexandra and other public gardens are attractive. The harbour lies between the pier on the north and the spur of land called the Nothe on the south, and is protected by a concrete wall extending 500 ft. northward from the Nothe. The principal buildings are the old town hall, the market house, the guildhall, the Royal Dorset Yacht Clubhouse, the theatre, the Royal Victoria Jubilee Hall, the Weymouth and Dorset eye infirmary, the Weymouth royal hospital and dispensary and the barracks. Of the numerous churches none dates from before the 19th century. Opposite the Royal Terrace is an equestrian statue of George III. erected in 1809 in commemoration of his jubilee. A number of modern buildings are to be seen in all parts of the town. The harbour, the maritime trade, and the landing of goods were controlled by Henry VIII. for the protection of the shipping. The principal exports are Portland stone, bricks and tiles and provisions, and the imports are coal, timber, garden and dairy produce and wine. Ship and boat building, rope and sail making, and brewing are carried on. The Great Western railway company maintains a regular service of passenger steamers to Guernsey and Jersey. The municipal borough is under a mayor, 8 aldermen and 24 councillors. Area, 1299 acres.

Although its convenient harbour was probably used before Saxon times, and bronze weapons and Roman inscriptions have been found, there is no evidence that Weymouth (Wrinmu, Wainmu) was a place of early settlement. The first mention of "that place called Weymouth" occurs in a charter of King Ethelred (866-871), while it is again spoken of in a charter of King Æthelstan (895-940). Edward the Confessor gave the manor to the church of Winchester in 1042, and it remained with the prior and convent of St. Swithin until the 14th century, when it passed by exchange to Gilbert de Clare, earl of Gloucester, though the vassals of the prior and convent remained exempt from dues and tonnage in the port. Coming by marriage into the hands of the earls of March and Plantagenets, the manor was finally vested in the crown. The first charter was that granted by the prior and convent in 1252, by which Weymouth was made a free borough and port for all merchants, the burgesses holding their burgages by the same customs as those of Portsmouth and Southampton. The demand of six ships from the town by the king in 1324 shows its importance in the 14th century, but there is no mention of a mayor until 1467. It is probable that the town suffered considerably at the hands of the French at the beginning of the 15th century, though in 1404 the townsmen of Weymouth were victorious over a party of Flemings in the Isle of Portland. Early in the 16th century the commercial rivalry between Weymouth and the neighbouring borough of Melcombe came to a height. Melcombe had received a charter from Edward I. in 1280 granting to its burgesses half the port and privileges similar to those enjoyed by the citizens of London; Edward II. in 1307-1308 granted that its men might elect for themselves two bailiffs. The date of the grant of the town at an annual fee-farm of 8 marks is uncertain, but in the reign of Henry VI. a commission was appointed to inspect the destruction wrought by the king's enemies on the town, with the result that the fee-farm was reduced to 26s. The continual disputes between the two boroughs led to the passing of an act of union in 1571, the new borough being incorporated under the title of the "MayoI, Bailiffs and Burgesses" by James I. in 1616; further charters were granted by Charles II. and George II. Melcombe Regis first returned two members to parliament in 1507, and Weymouth in 1319, four members being returned by the united boroughs until 1832, when the representation was reduced to two and ceased in 1885. The medieval fairs are no longer held. As early as 1322 a trade war between Weymouth and Melcombe was ended by a treaty of peace, and a history of customs on wool and wool-felt is mentioned at Weymouth, while wine was imported from Aquitaine. In 1586 sugar is mentioned as an import, and in 1646 deal boards were brought here from Hamburg. The town suffered severely during the Civil War, being garrisoned by the parliamentary troops in 1642, taken by the earl of Carnarvon in 1643, and surrendered in the following year. The town is described as "but little" in 1733, but a few years afterwards it gained a reputation as a watering-place, and the duke of Gloucester built a house here; George III. and the royal family in 1780 paid Weymouth the first of a series of visits which further ensured its popularity.

WHALE, the English name applied to all the larger and some of the smaller representatives of the order CETACEA (q.v.). Although by their mode of life far removed from close observation, whales are in many respects the most interesting and wonderful of all the animals. In the structure and habits of these animals affords is that, in the endeavour to discover what a creature really is, from what others it is descended, and to which it is related, the outward appearance affords little clue, and we must go deep below the surface to find the essential characteristics of its nature. There was once, and may be still, an idea that a whale is a fish. To realize the folly of this notion we have only to consider what a fish really is, what under all the diversities of form, size and colour there is common to all fishes, and we see that in everything which characterizes a true fish and separates if from other classes, as reptiles, birds and mammals, the whale resembles the last and differs from the fish. It is as essentially a mammal as a cow or a horse, and simply resembles a fish externally because it is adapted to inhabit the same element; but it is no more on that account a fish than is a bat (because adapted to pass a great part of its existence on the wing) nearly related to a bird. In every part of the structure of a whale we see the result of two principles acting and reacting upon each other—one on the one hand adherence to type, or rather to fundamental inherited structural conditions, and on the other, adaptation to the peculiar circumstances under which it lives, and to which it has become gradually fitted. The external fish-like form is perfectly suited for
swimming through the water; the tail, however, is not placed vertically as in fishes, but horizontally, a position which accords better with the constant necessity for rising to the surface for the purpose of breathing. The hairy covering characteristic of all mammals, which if present might interfere with rapidity of movement through the water, is reduced to the merest rudiments—a few short bristles about the chin or upper lip—which are often only present in young animals. The function of keeping the body warm is performed by a thick layer of non-conducting

material, the "blubber," a dense kind of fat placed immediately beneath the skin. The fore-limbs, though functionally reduced to mere paddles, with no power of motion except at the shoulder-joint, have beneath their smooth and continuous external covering all the bones, joints and even most of the muscles, nerves and arteries of the human arm and hand; and rudiments even of hind-legs are found buried deep in the interior of the animal, serving no useful purpose, but pointing a lesson to those able to read it.

In the present article attention is directed only to what may be regarded as the typical whales. Of these the Greenland or Arctic right whale (Balaena mysticetus) attains, when fully grown, a length of from 45 to 50 ft. In this species (fig. 1) all the peculiarities which distinguish the head and mouth of the whales from those of other mammals have attained their greatest development. The head is of enormous size, exceeding one-third the whole length of the creature. The cavity of the mouth is actually larger than that of the body, thorax and abdomen together. The upper jaw is very narrow, but greatly arched from before backwards, to increase the height of the cavity and allow for the great length of the whalebone-blades; the enormous lateral halves of the lower jaw are widely separated posteriorly, and have a further outward sweep before they meet at the symphysis in front, giving the floor of the mouth the shape of an immense spoon. The whalebone-blades attained the number of 380 or more on each side, and those in the middle of the series have a length of 10 or sometimes 12 ft. They are black in colour, fine and highly elastic in texture, and fray out at the inner edge and ends into long, delicate, soft, almost silky, but tough hairs. The remarkable development of the mouth and of the structures in connexion with it, which distinguishes the right whale from all its allies, is entirely in relation to the nature of its food. By this apparatus the creature is enabled to avail itself of the minute but highly nutritious crustaceans and pteropods which swarm in immense shoals in the seas it frequents. The large mouth enables it to take in at one time a sufficient quantity of water filled with these small organisms and the length and delicate structure of the whalebone provide an efficient strainer or hair-sieve by which the water can be drained off. If the whalebone were rigid, and only as long as is the aperture between the upper and lower jaws when the mouth is shut, a space would be left beneath it when the jaws were separated, through which the water and the minute particles of food would escape. But instead of this the long, slender, brush-like, elastic ends of the whalebone blades fold back when the mouth is closed, the front ones passing below the hinder ones in a channel lying between the tongue and the lower jaw. When the mouth is opened, their elasticity causes them to straighten out like a bow unbent, so that at whatever distance the jaws are separated the strainer

remains in perfect action, filling the whole of the interval. The mechanical perfection of the arrangement is completed by the great development of the lower lip, which rises stiffly above the jaw-bone and prevents the long, slender, flexible ends of the whalebone from being carried outwards by the rush of water from the mouth, when its cavity is being diminished by the closure of the jaws and raising of the tongue.

If, as appears highly probable, the "bowhead" of the Okhotsk Sea and Bering Strait belongs to this species, its range is circum-polar. Though found in the seas on both sides of Greenland, and passing freely from one to the other, it is never seen so far south as Cape Farewell; but on the Labrador coast, where a cold stream sets down from the north, its range is somewhat farther. In, the Bering Sea, according to Scammon, "it is seen in thousands by the fiery fields parallel, which is about the farthest southern extent of the winter ice, while in the Sea of Okhotsk its southern limit is about the latitude of 54°." Everything tends to prove, Scammon says, "that Balaena mysticetus is truly an "ice whale," for among the scattered floes, or about the borders of the ice-fields or barriers, is its home and feeding-ground. It is true that these animals are pursued in the open water during the summer months, but in no instance have we learned of their being captured south of where winter ice-fields are occasionally met with." The occurrence of this species, therefore, on the British or any European coast is unlikely, as when alive and in health the southern limit of its range in the North Sea is from the east coast of Greenland at 64° N. lat. along the north of Iceland towards Spitzbergen, and a glance at a physical chart will show that there are no currents setting southwards which could bear a disabled animal or a floating carcasse to the British shores. To this improbability may be added the fact that no authentic instance has been recorded of the capture or stranding of this species upon any European coast. Scammon, however, states that amongst the Azores, And, and Faroe Islands, as well as on the coast of Labrador, and on the coast of Greenland, have in a few instances found their way to British shores, it would be rash to deny the possibility of the Greenland right whale doing the same.

The black whale or southern right whale (B. australis) resembles the preceding in the absence of a dorsal fin and of longitudinal furrows in the skin of the throat and chest, but differs in that it possesses a smaller head in proportion to its body, shorter whalebone, a different-shaped contour of the upper margin of the lower lip, and a greater number of vertebrae. This type inhabits the temperate seas of both southern and northern hemispheres and is divided into several species according to their geographical distribution: B. bicoayensis of the North Atlantic, B. japonica of the North Pacific, B. australis of the South Atlantic, and B. antarctic and B. macroceroides of the South Pacific. But the differential characters by which they are separated are slight, and the number of specimens available for comparison is not sufficient to afford the necessary data to determine whether these characters can be regarded as specific or not.

The Biscay right whale was formerly abundant in the North Atlantic, but is now verging on extinction. This was the whale the pursuit of which gave occupation to a numerous population on the

FIG. 1.—The Greenland or Arctic Right Whale (Balaena mysticetus),

shores of the Basque provinces of France and Spain in the middle ages. From the 10th to the 16th centuries Bayonne, Biarritz, St. Jean de Luz and San Sebastian were the centres of an active whale "fishery," which supplied Europe with oil and whalebone. In later times the whales were pursued as far as the coast of Newfoundland. They were, however, already getting scarce when the voyages under

taken towards the close of the 16th century for the discovery of the north-eastern route to China and India opened the seas round Spitzbergen: then for the first time the existence of the Greenland whale became known, and henceforth the energies of the European whale-fishers became concentrated upon that animal. Among instances of the occurrence of this whale in Europe in modern times
may be mentioned three, namely, in the harbour of San Sebastian in January 1854, in the Gulf of Taranto, in the Mediterranean, in February 1877, and on the Spanish coast between Galicia and Zarauz in February 1878. The skeletons of these whales are preserved in the museums of Copenhagen, Naples and San Sebastian respectively. On the coast of the United States several thousand dollars worth of a cargo of whalebone belonging to this species was received at New Bedford in 1896. During the latter half of the 19th century the Eskimos traded for whalebone. That the Basques seem to have well-nigh exterminated in their own waters; and it was not till a later epoch that the pursuit of the large baleened cousins, the (Balaena mysticetus), was initiated. Hunting the sperm-whale, or cachalot, in the South Sea was a still later development, while roqual-hunting is quite a modern industry.

Of whaling vessels of the old type, a brief notice will suffice. Those engaged in the British South Sea fishery, which was in its prime about the year 1790, were from 400 to 400 tons burden, and equipped for at least a three-years' voyage. They carried from 28 to 33 officers and men, and six whale-boats. Built sharp at both ends, these boats were about 27 ft. long, and were hung in laths and framework, and a strip of the blubber cut in a spiral direction. By raising this strip with the aid of proper apparatus, the whale could be turned round and round on its axis, and nearly the whole of the blubber removed in a continuous piece, to be cut, as required, into convenient lengths. Meanwhile the liquid sperm-oil, or "head-matter," was ladled out in buckets from the great cavity in the skull and put in casks, where it solidified, to be carried to port and there refined. The blubber was, however, reduced to oil by "try-marks" with which the vessel was provided, and stored in barrels. A large whale sperm-whale will yield as much as 350 tons of oil; while the yield of a small female does not exceed 1 or 2 tons. In the old days the cargo of a successful vessel might include the products of a hundred whales, yielding from 150 to 200 tons of boiled sperm-oil in addition to the spermaceti.

In the old days of the Greenland whale-fishery vessels of about 350 tons burden were deemed the most eligible, these being constructed in such a manner as to resist so far as possible the pressure of the ice. The crew was about fifty in number, and the vessel carried six or seven whale-boats of the same length as those used in the South Sea fishery. The vessels left Peterhead and Dundee (the ports for the Greenland fishery, as was London for the South Sea fishery) about the beginning of April, and, after touching at the Shetlands, reached the whaling-grounds before the end of that month. In approaching a whale, which was effectual from behind, silence was essential, and the harpoon had to be delivered within a distance of a few yards. The moment the wounded whale disappeared a flag was hoisted in the boat to give notice that assistance was required. At the signal to the line the whaleboat, of the utmost importance, as if it became entangled the boat would be drawn under water by the whale. Sometimes its motion
was retarded by one or more turns round the "bollard," a post fixed for this purpose in the boat; when this was done the friction was so great as to produce quantities of smoke, fire being prevented by sluicing the bollard with water. Even with the assistance offered by the bollard, the whale-line might be run out within ten minutes, when the lines of a second or even third whale were made fast. When a harnessed whale was towed at a rate of 700 fathoms of line would be taken out; the whale commonly remaining under water when first wounded for about 40 minutes, although a period of an hour is said to be not uncommon. On rising after its second descent the whale was attacked with lances thrust deep into the body and aimed at the vital parts. The old-fashioned lance was a 6-ft. rod and ¾-in. iron, flattened at one end into the form of a lance-head with cutting edges, and at the other expanding into a socket for the reception of a short wooden handle. Torrents of blood spouted from the blow-hole of the whale denoted the approach of the struggle. So soon as the whale was dead, no time was lost in piercing the tail or "flukes," and thus making the carcass fast to the boats by means of a cable, and then towing it in the direction of the ship. From fifteen minutes to as much as fifty hours might be occupied in a whale-hunt.

The following account of the operation of "flensing," or securing the blubber and whalebone of the Greenland whale, is taken from Sir William Jardine's Naturalists' Library:—

"The huge carcass is somewhat extended by strong tackles placed at the snout and tail. A band of blubber, two or three feet in width, encircling the whale's body at which the neck in other animals, is called the kent, because by means of it the whale is turned over or kent. To this band is fixed the lower extremity of a combination of powerful blocks, called the kent-purchase, by means of which the whole circumference of the animal is, section by section, brought to the surface. The harpooners, having spikes on their feet to prevent their falling from the carcass, then begin with a kind of spade, and with huy knives, to make long parallel cuts from end to end, which are divided by cross-cuts into pieces of about a half a ton. These are conveyed on deck, and, after being reduced to smaller portions, are stowed in the hold. Finally, being by other operations still further divided, the blubber is put into casks, which is called "making-off," and packed down completely by a suitable instrument.

"While this flensing is proceeding, and when it reaches the lips, which contain much oil, the baleen (whalebone) is exposed. This is detached by means of bone-handspikes, bone knives and bone spades. The whole whalebone is hoisted on deck in one mass, when it is split by bone wedges into joints, containing five or ten blades each. The blubber and whalebone are thus secured, the two jaw-bones, from the quantity of oil which they contain, are usually hoisted on deck, and then only the krenge remains—the huge carcass of flesh and bone, which is abandoned either to the birds or the bears, which duly attend on such occasions for their share of the prey."

The largest cargo ever secured by a Scotch whaler was that of the "Revolution" of Peterhead in 1814, which comprised the products of no less than forty-four whales. The oil, which amounted to 290 tons, realized £568, while the price obtained for the whalebone, added to the government bounty then given to Greenland whalers, brought up the total sum to £1,100. Allowing a ton to each whale, the whalebone alone at present prices would have yielded about £10,000.

At a later period, say about 1880, the Greenland whaler had grown to a vessel of from 400 to 500 tons gross register, rigged either as a bark, schooner, or proa with auxiliary engines of about 75 horse-power. She would be manned by from fifteen to sixty hands, and would carry eight boats of the type mentioned above. Below the hold-beams were fitted about fifty iron tanks capable of containing from 200 to 250 tons of oil. Such a vessel would cost about £15,000 to build, and her working expenses, exclusive of interest and insurance, would be about £200 a month. At the period mentioned each whale-boat was armed with a harpoon-gun measuring 4 ft. 6 in, in length and weighing 75 lb; the barrel being 3 ft. long, with 1¾-in. bore, and mounted in a wooden stock, tapering behind into a pistol-handle. The gun-harpoon is used solely for first getting on to the whales; hand-harpoons being employed for getting a hold with other lines.

Without referring to further improvements in the weapons and vessels employed, it will suffice to state that in the Greenland whale-fishery the whales are still killed from whale-boats. In the roqual-fishery, as at Newfoundland, on the other hand, the actual attack is made from a steam- vessel of considerable size, as is described in the following quotation from a paper by Mr G. M. Allen in the American Naturalist for 1904, referring to the fishery at Rose-au-Rue, Placentia Bay, Newfoundland:

"The fishery itself," observes the author, "is carried on by means of small and staunchly built iron steamers of something over one hundred tons. A cannon-like gun is mounted on a pivot at the bow, and discharges a 5½-ft. harpoon of over 180 lb weight, which at short range is nearly buried in the body of the whale. A hollow iron cap filled with blasting powder is screwed to the tip of the harpoon, forming its point. A timed fuse discharges the bomb inside the body of the whale. The harpooner carries a stout cable which is handled by a powerful 5-sheet winch on the steamer's deck."

Explosive harpoons of the type referred to were invented by Svend Fyn, a Norwegian, and used by him about the year 1865 or 1866 in the manner described above, as they still are in various Norwegian roqual-fisheries.

In fisheries of this type the carcasses of the whales are towed into harbour for flensing; and in place of the "krenge" being wasted, the flesh is worked up to form an excellent manure, while the bones are ground up and also used as fertilisers.

A somewhat similar mode of proceeding characterizes the sperm whale fishery now carried on in the Azores, so far at least as the towing of the carcasses to shore for the purpose of flensing is concerned. According to an account given by Professor E. L. Bouvier in the Bulletin de l'Institut Oceanographique for 1907, American whalers have observation stations on most of the islands of the Azores group; Horta, in Fayal, being the favourite station. The carcasses of the cachalots are towed for flensing into a small creek adjacent to the port, where, after the removal of the spermaceti and blubber, they are left to rot. Even the teeth have a commercial value, being either sold as curiosities in Horta, or utilized for ivory. Whenever practicable, the whales caught by the vessels belonging to the great sperm-whaling station at New Bedford are towed into the harbour for flensing.

Passing on to a review of some of the more important whale fisheries of the world, the Atlantic fishery by the Basques in the 10th and six succeeding centuries claims first mention. Readers desirous of obtaining further insight into the little that is known about it are referred to an interesting paper by Sir Clements Markham published in the Proceedings of the Zoological Society of London for 1881. Although, as already noted, the black whale (Balaena mysticetus) was well-nigh exterminated in the north Atlantic by the 18th and 19th centuries, many years afterwards was excessively rare, yet quite recently several examples have been taken by Scottish whalers off the Hebrides, while the whalebone of others has been received at New Bedford.

The discovery in 1596 by the Dutch navigator Barents of Spitzbergen, followed by the voyage of Hudson in the "Hopewell" in 1607, may be said to have inaugurated the second phase in the whaling industry; these adventurous voyages bringing to light for the first time the existence of the Greenland whale (B. mysticetus); a species of much greater value than any that had been previously hunted.

Here it may be well to refer to two common misconceptions regarding this whale. In the first place, it does not appear to be, as commonly supposed, a circumpolar species. There is, for instance, no evidence of its occurrence eastward of Spitzbergen along the Siberian coast between 16° and 170° E.; and it is not till the latter parallel is reached, at Cape Schelagskoi, that the domain of the so-called bowhead of the American whales is entered.

"On the other side of the Bering Strait," writes Mr T. Southwell in the volume of Scotch Natural History for April 1847, "these whales do not appear to penetrate much farther east than Cape Bathurst, and it seems highly improbable that there is any intercommunication between those at that point and the whales in Baffin Bay. On the other hand, the whales on the east side of
Davis Strait do not descend so far south as Cape Farewell, nor are those in the Greenland Sea known to pass westward round that cape. It seems therefore that, although their range as a species is very extensive longitudinally, the localities they inhabit are greatly restricted, each being inhabited by a local race differing from the other in some slight degree.

The second misconception is that the Greenland whale has gradually been driven northward by the whalers. A sufficient proof of the falsity of this idea is afforded by the fact that the minute organisms constituting the food of the species are restricted to the icy seas of the far north. The Greenland whale is, in fact, essentially an ice-whale.

To revert to the history of the fishery, no sooner was the accessibility of the Spitzbergen seas made known than vessels were fitted out for whaling there, at first by the British, and soon after by the Dutch. The seas absolutely swarmed with whales, which showed little fear of vessels and could thus be captured with ease. The first whaling expedition was despatched by the Muscovy Company, under the command of Jonas Poole; and the success of four voyages (1600-1612) soon attracted the attention of other nations. Some indication of the abundance of the whales may be gathered from the fact that in the year 1607 no less than 1509 of these monsters were killed off Spitzbergen by 188 vessels.

The fishery in Davis Strait was begun in 1719 by the Dutch, who at first killed large numbers of whales and were subsequently followed by the British. Although many whales have been seen in recent years, few are taken; and it is the opinion of many that in Greenland waters, at any rate, steam has been fatal to the industry. But the following is a summary of the rise and fall of the British Greenland whale-fishery, given by Mr Southwell in the article already cited:—

"For the first quarter of the 19th century scarcely a seaport of any importance on the east coast of England was unrepresented in the Arctic fishery; Trent, Hull, Berwick, Aberdeen, Montrose, Kirkwall, Greenock and for a time Banff and B'ness, all took part in the whale-fishery. Gradually, one by one, they fell off, till only Peterhead, which sent out its first whaler in 1786, and Dundee (which departed in 1790) were left. In 1833 Peterhead, which in 1857 sent out 34 vessels, ceased to be represented in the industry, leaving Dundee in possession of the field. Dundee sent out its largest fleet in 1885-186 vessels; in 1890, she was represented by 5 vessels only, one of which was wrecked."

According to Mr Southwell's account of the Arctic fishery (Zoologist, 1866), a Dundee vessel, the "Scotia," visited the east Greenland seas in the summer of 1806, where she took four small right-whales; this visit being the first made to those seas by a British vessel since 1890.

As already mentioned, the British whalers were accustomed to sail for the Arctic Ocean early in April; and if their destination was the east Greenland sea, off the west coast of Spitzbergen, they generally arrived on the grounds about a month later. The whales make their appearance amongst the ice near the sea edge about the 15th of May, but only remain until the opening of the barrier-ice permits them to resume their northward journey; for about the middle of June they suddenly disappear from these grounds, and are last seen going north-west, when the north Greenland whale-fishing is over for the season. If unsuccessful in obtaining a cargo at the northern grounds, the whale-ships were accustomed to proceed southwards as far as lat. 75°; where, if the sea were sufficiently open, they penetrated westwards until the coast of Greenland became visible. There they cruised until August, when the darkness of the nights put an end to the season's fishing. If the south-west fishery, in Davis Strait, were the first object of the voyage, the vessels arrived at the edge of the ice near Resolution Island in April. If unsuccessful here they proceeded direct to Disco island, where they usually arrived early in May. The whales appear about the middle of May at South East Bay, where a great fishing was once carried on. The dangerous passage of Melville Bay was next performed; the whales entering the north water in June, and pushing on towards the south. If there were a "land-floe across," i.e., if the land-ice of the west side were continuous across the entrance of Ponda Bay and Lancaster Sound, whale-ships would be seen in considerable numbers and good cargoes might be obtained; but immediately the land-floe broke up they departed to the westward. When there was no land-floe across, the whales proceeded at once to the secluded waters of Eclipse Sound and Prince Regent Inlet for the summer months. At this season most of the vessels cruised in the sounds, but a few searched the middle ice, until the darkness of the August nights compelled them to seek anchorage in some of the harbours on the west side, to await the return of the whales south. This migration takes place on the formation of young ice in the sounds, usually in the latter part of September. Only the larger whales, most of which are males, come, however, close down along the land of the west side. These the ships sent their boats to intercept; this forming the inshore-fishing, or "rock-nosing," which continued till the formation of young ice drove the vessels out of harbour, usually early in October.

A few vessels, American as well as British, occasionally entered Hudson Bay and prosecuted the fishing in the neighbourhood of Southampton Island, even entering Fox Channel. There were whaling-stations in Cumberland Inlet, and although likewise remained throughout the winter, ready to take advantage of the opening of the ice in the following spring. Here both young and old whales make their appearance in May; and the fishing continued till the whales migrated northwards in June.

Of the other nationalities which took part in the Spitzbergen-Greenland fisheries, it may be mentioned that the Dutch had fisheries both at Jan Mayen till 1640 and at Spitzbergen. In the Spitzbergen fishery 10,019 whales were taken by them in the ten years from 1679 to 1688. About 1680, when the fishing was most prosperous, they had 280 vessels and 14,000 seamen employed. The fishery continued to flourish on an extensive scale till 1770, when it began to decline, and it finally came to a close before the end of the century. At the same time the Germans prosecuted the fishing to a very considerable extent; 79 vessels from Hamburg and Bremen being employed in 1721, while during the fifty years from 1670 to 1721 an average of 45 vessels sailed yearly from Hamburg alone. German vessels continued to engage in the fishery until 1873. The Spaniards, although they at first supplied the harpooners to the crews of the English and Dutch vessels, never seem to have engaged largely in the northern fishery. The Danes, although early appearing on the Spitzbergen fishing-grounds, never pursued the industry on a large scale until after the commencement of the Davis Strait fishing in 1721, in which year they had no vessels engaged; but by 1894 the number had fallen to 35.

The continually increasing rarity of the Greenland whale has caused an enormous appreciation in the value of whalebone of recent years, as compared with the price of whalebone of the last century. For about twenty years preceding the year 1840 the average price of this commodity was about £163 per ton; while in the year 1875 whalebone of the Greenland whale sold at £250 per ton, and that of the south Atlantic black whale (Balaena australis) at £145 per ton. At the present date the price is about £2500 per ton, but a few years ago it touched £2800, although soon after it fell for a short time to £1100. The reason of the fall from £2800 to £2500 (at which about the price the market has stood for some time) is believed to be owing to the use of strips of horn for many purposes where whalebone formerly entered; the price of the whalebone of the Greenland whale is, as indicated above, far more valuable than that yielded by the northern and southern Atlantic black whales, of which comparatively little generally comes into the market. The best quality of whalebone is known in the trade as "size-bone," and consists of plates not less than 6 ft. in length.

In the twenty years preceding 1840 the average price of whalebone, in the northern fishery, was £50 per ton; the actual price in 1855 being £80 per ton. At the present time the price is £112 per ton. It may be added that in 1835 South Sea oil sold at £43 and sperm-oil at £75 per ton. A few words will suffice for the American fishery of the so-called bowhead, the western race of the Greenland whale, in Bering Strait. Here the whales are mostly sought for and killed in open water, and the vessels are consequently less adapted for ice-work. For the most part the vessels sail from San Francisco in March, and arrive at the ice-edge off Cape Navarin, where the fishing is begun, in May. The whales
disappear during summer, but return in the autumn, when the “fall-fishing” is carried on in the neighbourhood of Point Barrow; and between the seasons it was customary for the vessels to go south for sperm-whaling. The Bering Strait fishery was begun in 1848, and in the months following, 250 to 300 whales were abandoned in the ice off Cape Belcher, the crews making good their escape to other vessels; while again in 1876 a dozen vessels experienced a similar fate.

The sperm-whale fishery, of which the products are spermaceti, sperm-oil, ambergris (most often found floating in masses in the sea) and teeth, appears to have been initiated by the Americans in 1609, who for a considerable period found sufficient occupation in the neighbourhood of their own coasts. The British are, however, stated to have opened up the great whaling-grounds of the Pacific and Indian Oceans, although they did not embark on sperm-whaling till 1775. Within less than twenty years from that date their trade had, however, attained its maximum; no less than 75 British vessels, all from the port of London, being engaged in this industry in the year 1791. After this there was a steady decline till 1830, when only 37 vessels were thus employed; and since 1853 sperm-whaling has ceased to be a British industry.

As regards the American fishery, the island of Nantucket embarked in this trade about the year 1712, and by 1774 there were 360 American ships engaged in whaling, while in 1848 when the fishery was at its zenith, the number was 735, mostly from New Bedford. Between 1875 and 1886 the average number of vessels had sunk to 150. New Bedford, on the Atlantic, and San Francisco, on the Pacific side, are the two great whaling centres; and during the period last mentioned the average imports of whaling products into the United States totalled 5304 tons of sperm-oil, together with 2803 tons of whale-oil and 145 tons of whalebone.

During the first half of the last century the colony of New South Wales was biannually engaged in this trade, and in 1835 exported 2093 tons of sperm-oil.

Since the year 1882, when no less than 203 head were taken by the Peterhead whaler “Eclipse,” the Norwegians have carried on a fishery for the bottle-nosed whale (Hyperoodon rostratus), a species which although generally inferior in point of size, yields an oil closely akin to sperm-oil, but possessed of even greater lubricating power. An average male bottle-nose will yield about 22 cwt. of oil, containing 5% of pure spermaceti. Bottle-nose fishing is chiefly carried on in the neighbourhood of Jan Mayen and Iceland during the months of May and June, and is now occurring quite suddenly about the middle of the last-mentioned month. In 1903 about 1900 tons of this oil came on the market, which would imply the destruction of nearly 2000 whales.

The invention by Svend Foyn of the explosive harpoon, already referred to, inaugurated about the year 1866 the Norwegian fin-whale fishery, an industry which has since been taken up by other nationalities. Therorquals or fin-whales (Balaenoptera), which include the largest of all cetaceans, are built for speed, and are much fiercer animals than either the Greenland or the Indian right whales; their rush when wounded being of enormous velocity, while their vitality is such that attacking them in the old-fashioned way with the hand-harpoon is practically useless, and at the same time fraught with great danger to the pursuers. To a considerable extent the same may be affirmed of the humpbacked whale (Megaptera). Under these circumstances, previous to the invention of the bomb-harpoon, these whales were left entirely alone by the whalers.

By the year 1885 the Norwegians had a fleet of over 30 vessels engaged in this fishery off the coast of Finnmark, the amount of whose catch comprised 1300 whales in 1885, and 545 in the following year. Gradually the Norwegians have developed and extended the roqual-fin-whale, and they now possess stations in Iceland, the Faroes and Shetlands, and also at Buneveeneder in Harris in the Hebrides. In the Shetlands there are two stations at the head of Ronas Voe on the north-west side of the mainland where operations are carried on from May and June till September, when the whales leave the shore. During the first season (1903) the Nornna Whaling Company’s vessels killed 64 whales, while 62 were accounted for by the Shetland Whaling Company.

In 1898 a successful roqual-fin-whale fishery was established by the Newfoundland Steam Whaling Company at Rose-au-Rue, Placentia Bay, Newfoundland. Four species of roquals as well as humpbacks are hunted; and during a portion of the season in 1903 the catch included 174 of the former and 14 of the latter.

In addition to the above-mentioned fisheries for the larger whales, there are considerable local captures of the smaller kinds, commonly known as grampus or killers, porpoises, and dolphins. Of these, however, very brief mention must suffice. The most important captures are generally made in northern seas, the block pilot-whale, or grampus (Glomar euphalaus melas), is, for instance, not infrequently taken in large shoals by the Faro islanders; these whales being driven by boats into the shallows, where they are sometimes slaughtered by hundreds. Much the same may be stated with regard to the grampus or killer (Orca gladiator), of which no less than 47 head were killed at once in January 1904 at Bildstraumen, Norway. Of even more importance is the white-whale or beluga (Delphinapterus leucas), which is hunted for its blubber, hide and flesh; the average yield per head being about 100 gallons of oil. In 1871 the Tromsøe Whalers captured no less than 2167 tons of whale-oil, or 300 out of a school of some 900 were captured on a single occasion at Point Barrow, Alaska. These whales, which are worth about £3 a head, yield the leather known commercially as “porpoise-hide.” The narwhal (Monodon monoceros), yielding both blubber and the valuable ivory tusks, is usually captured singly by the Greenlanders in their “kayaks.” Local porpoise and dolphin fisheries are carried on by the fishermen in many parts of the world, the natives of the Traveancoast being noted for their success in this respect; while even the fresh-water susa or Ganges dolphins (Lipotes vulpinus) and the Rio de la Plata dolphin (Pontoporia blainvillei) are also caught in considerable numbers for the sake of their blubber.

WHALE-OIL, the oil obtained from the blubber of various species of the genus Balaena, as B. mysticetus, Greenland or the right whale (northern whale-oil), B. borealis (northern whale-oil), Balaenoptera longirostris, Balaenoptera borealis, and the Minke whale, all of the Indian right whale; as well as the “beluga” or “killer” whale, and the “black whale” or whale-oil, also yield whale-oils. “Train-oil” proper is the northern whale-oil, but this term has been applied to all blubber oils, and in Germany, to all marine animal oils—fish-oils, liver oils, and blubber oils. The most important whale-oil is sperm or spermaceti oil, yielded by the sperm-whales.

Whale-oil varies in colour from a bright honey yellow to a dark brown, according to the condition of the blubber from which it has been extracted. At best it has a rank fishy odour, and the darker the colour the more disagreeable the smell. With lowering of the temperature therein, accompanied with a small proportion of spermaceti, separates from the oil, and a little under the latter point nearly the whole of these constituents may be crystallized out. When separated and pressed, this deposit is known as whale tallow, and the oil from which it is removed is distinguished as pressed whale-oil; this, owing to its limpidity, is sometimes passed as sperm-oil. Whale-oil is principally used in oily woods for combing,
in batching flax and other vegetable fibres, in currying and chamois leather-making, and as a lubricant for machinery. Sperm-oil is obtained from the cavity in the head of the sperm-whale, and several smaller receptacles throughout the body of the animal. During the life of the whale the contents of these cavities are in a fluid condition, but no sooner is the "head matter" removed than the oil precipitates and solidifies to a yellow congealed mass when the oil is a clear yellow fluid having a fishy odour. Refined sperm-oil is a most valuable lubricant for small and delicate machinery (see OILS).

WHALLEY, EDWARD (c. 1615-c. 1675). English regicide, the exact dates of whose birth and death are unknown, was the second son of Richard Whalley, who had been sheriff of Nottinghamshire in 1595, by his second wife Frances Cromwell, aunt of Oliver. His great-grandfather was Richard the Whalley (1440-1583), a prominent adherent of the protector Somerset and member of parliament. He is said to have started in the trade of a woollen-draaper, but on the outbreak of the great rebellion he took up arms for the parliament, became major of Cromwell's regiment of horse, and greatly distinguished himself in the field. His conduct at Gainsborough fight in 1643 was especially praised by Cromwell; he fought at Marston Moor, commanded one of Cromwell's two regiments of cavalry at Naseby and at the capture of Bristol, was then sent into Oxfordshire, and in 1646 was made one of the Worcestershire regiments. He was superseded, according to Richard Baxter, the chaplain of his regiment, on account of his religious orthodoxy. He, however, supported his regiment in their grievances against the parliament in 1647. When the king was seized by the army, he was entrusted to the keeping of Whalley and his regiment at Hampton Court. Whalley refused to remove Charles's chaplains at the bidding of the parliamentary commissioners, and treated his captive with due courtesy, receiving from Charles after his flight a friendly letter of thanks. In the second Civil War, Whalley again distinguished himself as a soldier, and when the king was brought to trial he was chosen to be one of the tribunal and signed his death-warrant. He took part in Cromwell's Scottish expedition, was wounded at Dunbar, and in the autumn of 1650 was active in dealing with the situation in north Britain. Next year he took part in Cromwell's pursuit of Charles II. and was in the fight at Worcester. He followed and supported his great kinsman in his political career, presented the army petition to parliament (August 1662), approved of the protectorate, and represented Nottinghamshire in the parliaments of 1654 and 1656. As an active part in the prosecution of the last Whalley, James Naylor. He was one of the administrative major-generals, and was responsible for Lincoln, Nottingham, Derby, Warwick and Leicester. He supported the "Petition and Advice," except as regards the proposed assumption of the royal title by Cromwell, and became a member of the newly constituted House of Lords in December 1657. On the protector's death, at which he was present, he in vain gave his support to Richard; his regiment refused to obey his orders, and the Long Parliament dismissed him from his command as a representative of the army. In November 1659 he undertook an unsuccessful mission to Scotland to arrange terms with Monk. At the Restoration, Whalley, with his son-in-law, General William Goffe, escaped to America, and landed at Boston on the 27th of July 1660, living successively at New Haven and at Hadley, Massachusetts, every attempt on the part of the government at home to procure his arrest meeting with failure. He was alive, but failing in health, in 1674, and probably did not long survive. Whalley was twice married; first to Judith Duffell, by whom, besides other children, he had a son John and a daughter Frances (who married Major-General William Goffe, the regicide); and secondly to Mary Middleton, sister of Sir George Middleton, by whom he had two sons, Henry and Edward.

AUTHORITIES.—An account of Whalley's life is in Noble's Lives of the Regicides, and of his family in Noble's Memoirs of the Pro
tectoral House of Cromwell, vol. ii.; see also Gardiner's and Chren
dale's Early Times of the English People, iii. 439 (1843); Whalley's account of the king's flight; Ezra Stiles's History of the Con
tinent of the Judges of Charles I. (1794, &c.). The article by C. H. Firth in the Dict. Nat. Bio, is an admirable summary. Whalley's sojourn in America is dealt with in numerous papers published by the Massachusetts Historical Society, and in the Hutchinson Papers published (1865) by the Prince Society; see also Atlantic Monthly, vi. 89-93; Pennsylvania Mag., l. 55-66, 230, 359; F. B. Dexter's Notes and Queries, iii. 272-273; The New Haven Col. Hist. Papers, ii. (1877); Poem commemorating of Goffe, Whalley and Dixwell, with abstract of their history, by Philogathos (Boston, 1793); Palliser's Hist. of New England, ii. (1866); New England Historical and Genealogical Register, xxxiv. 359 (bibliography of American works on the regicides).

WHARF, a place for loading or unloading ships or vessels, particularly a platform of timber, stone or other material along the shore of a harbour or along the bank of a navigable river against which vessels may lie and discharge their cargo or be loaded. The O. Eng. word wharf meant literally a turning or turning-place (waverf, to turn, cf. Goth. wainbar, Gr. karpos, wrist), and was thus used particularly of a bank of earth, a dam that turns the flow of a stream; the cognate word in Dutch, weef, meant a a wharf. According to a wharf is styled a "wharfinger," properly "wharfager," with an intrusive n, as in "message" and "passenger."

WHARNCLIFFE, JAMES ARCHIBALD STUART-WORTLEY-MACKENZIE, 1st BARON (1776-1845). English statesman, was the son of Colonel Stuart, son of the 3rd earl of Bute and of Mabel Mary Whall (whom his wife Mary Wortley-Montagu Baronness Mountnorris (in her own right), as whose heir Colonel Stuart added the name of Wortley, taking later also that of Mackenzie (which his son in later life discarded) as heir to his uncle J. S. Mackenzie of Rosehaugh. He entered the army, becoming colonel in 1797, but retired in 1801 and devoted himself to politics, sitting in parliament as a Tory for Bossiney in Cornwall till 1818, when he was returned for Yorkshire. His attitude on various questions became gradually more Liberal, and his support of Catholic emancipation lost him his seat in 1826. He was then raised to the peerage as Baron Wharncliffe of Wortley, a recognition both of his previous parliamentary activity and of his high position among the country gentlemen. At first opposing the Reform Bill, he gradually came to see the undesirability of a popular conflict, and he separated himself from the Tories and took an important part in modifying the attitude of the peers and helping to pass the bill, though his attempts at amendment only resulted in its pleasing neither party. He became lord privy seal in Peel's short ministry at the end of 1834, and again joined him in 1841 as lord president of the council. In 1837 he brought out an edition of the writings of his wife Mary Wortley-Montagu, ed. by J. P. Wharton (1842). On his death in 1845 he was succeeded as 2nd baron by his eldest son, John Stuart-Wortley (1801-1855), whose son Edward, 3rd baron (1827-1899), best known as chairman of the Manchester, Lincoln & Sheffield railway, converted under him into the Great Central, was created 1st earl of Wharncliffe and Viscount Carlton in 1876; his name was prominently identified with railway enterprise, and became attached to certain features of its nomenclature. He was succeeded as 2nd earl by his nephew Francis (b. 1856).

Among other members of the family, several of whom distinguished themselves in law, politics, art and the army, may be mentioned the 1st baron's third son, James Archibald Stuart-Wortley (1805-1881), recorder of London and solicitor-general; his son, C. B. Stuart-Wortley, K.C. (b. 1851), became well known in parliament as under-secretary for the home office (1885, and 1886-1892) and deputy-chairman of committees.

WHARTON (FAMILY). The Whartons of Wharton were an old north of England family, and in 1543 Thomas Wharton (1495-
1543) was created a baron for his services in border warfare. From his descendants, whose heads of the latter, Philip Wharton (1612-1697), was the father of Thomas Wharton (1648-1715), who in 1706 was created baron and in
WHARTON, F.—WHATELY

1714 marquess of Wharton. The 1st marquess was one of the chief Whig politicians after the Revolution. He is famous in literary history as the author of the famous political ballad, *Lilliburlero*, which "sang James II. out of three kingdoms." Wharton was lord-lieutenant of Ireland in Anne's reign, and incurred the wrath of Swift, who attacked him as Verres in the *Examiner* (No. 14), and drew a separate "character" of him, which is one of Swift's masterpieces. He was a man of great wit and versatile cleverness, and cynically ostentatious in his immorality, having the reputation of being the greatest rake and the truest Whig of his time. Addison dedicated to him the fifth volume of the *Spectator*, giving him a very different "character" from Wharton's, but his memoirs of him are not so well known as his literary works. Dr. Wharton (1662-1731), duke of Wharton, succeeded to his father's marquessate and fortune, and in 1718 was created a duke.

But he quickly earned for himself, by his wild and profligate frolics and reckless playing at politics, Pope's satire of him as "the scorn and wonder of our days" (*Moral Essays*, i. 179).

He spent his large estates in a few years, then went abroad and gave eccentric support to the Old Pretender. There is a lively picture of him at a dance at Madrid in 1726 in which he was caught in a British cyclone, quoted in Stanhope's *History of England* (ii. 140). He was outlawed in 1729, and at his death the titles became extinct. In 1843 a claim was made before the House of Lords for a revival of the barony in favour of Mr Kemsley-Tynhe, a descendant of the 1st baron in the female line.

For the history of the family see E. R. Wharton's *Whartons of Wharton Hall* (1869).

WHARTON, FRANCIS (1852-1886), American legal writer and educationalist, was born in Philadelphia, Pennsylvania, on the 7th of March 1852. He graduated at Yale in 1870, was admitted to the bar in 1873, became prominent in Pennsylvania politics as a Democrat, and in Philadelphia edited the *North American and United States Gazette*. He was professor of English literature and history at Kenyon College, Gambier, Ohio, in 1856-1861. He took orders in the Episcopal Church in 1862 and in 1863-1869 was rector of St Paul's Church, Brookline, Massachusetts. In 1871-1876 he taught ecclesiastical polity and canon law in the Protestant Episcopal Theological School at Cambridge, Massachusetts, and at this time he lectured on the conflict of laws at Boston University. For two years he travelled in Europe, and after his return to Madison in 1876 he went to Washington, D.C., where he was lecturer on criminal law (1885-1886) and then professor of criminal law (1886-1888) at Columbian (now George Washington) University; in 1885-1888 he was solicitor (or examiner of claims) of the Department of State, and from 1888 to his death on the 21st of February 1889 was employed on an edition (authorized by Congress) of the *Revolutionary Diplomatic Correspondence of the United States* (6 vols., 1889, ed. by J. B. Moore), which superseded Sparks's compilation. Wharton was a "broad churchman" and was deeply interested in the history of his church. He received the degree of LL.D. from the university of Edinburgh in 1883, and was the foremost American authority on international law.

See the *Memoir* (Philadelphia, 1891) by his daughter, Mrs Viele, and *Memoir of D. R. B. Moore's "Brief Sketch of the Life of Francis Wharton," prefixed to the first volume of the *Revolutionary Diplomatic Correspondence*.

WHARTON, HENRY (1664-1695), English writer, was descended from Thomas, 2nd Baron Wharton (1520-1577), being a son of the Rev. Edmund Wharton, vicar of Worstead, Norfolk. Born at Worstead on the 6th of November 1664, Wharton was educated by his father, and then at Gonville and Caius College, Cambridge. Both his industry and his talents were exceptional, and his university career was brilliant. In 1686 he entered the service of the ecclesiastical historian, the Rev. William Cave (1637-1713), whom he helped in his literary work; but considering that his assistance was not sufficiently appreciated he soon forsook this employment. In 1687 he was ordained deacon, and in 1688 he made the acquaintance of the archbishop of Canterbury, William Sancroft, under whose influence he became an ardent supporter of his literary work with more zeal. The archbishop, who had a very high opinion of Wharton's character and talents, made him one of his chaplains, and presented him to the Kentish living of Sundridge, and afterwards to that of Chatham in the same county. In 1689 he took the oath of allegiance to William and Mary, but he wrote a severe criticism of Bishop Burnet's *History of the Reformation*, and it was partly owing to the bishop's hostility that he did not obtain further preferment in the English church. He died on the 5th of March 1695, and was buried in Westminster Abbey.

Wharton's most valuable work is his *Anglia sacra*, a collection of the lives of English archbishops and bishops, which he published in two volumes in 1691. Some of these were written by Wharton himself; others were borrowed from early writers. His other writings include, in addition to his criticism of the *History of the Reformation*, a *Moral Dissertation. A Treatise of the Caliby of the clergy* (1686); *The enthusiasm of the Church of Rome demonstrated in some observations upon the life of Ignatius Loyola* (1688); and *A defence of pluralities* (1692, new ed. 1703). In the Lambeth Library there are sixteen volumes of Wharton's manuscripts. Describing him as "this wonderful man," Stubbs says that Wharton did for the elucidation of English Church history "more than any one before or since." A life of Wharton is included in George D'Ouy's *Life of W. Sancroft* (1821).

WHATELY, RICHARD (1787-1865), English logician and theological writer, archbishop of Dublin, was born in London on the 1st of February 1787. He was educated at a private school near Bristol, and at Oriel College, Oxford. He obtained double second-class honours and the prize for the English essay; in 1811 he was elected fellow of Oriel, and in 1814 took orders. During his residence at Oxford he wrote his celebrated tract, *Historic Doubts relative to Napoleon Bonaparte*, a very clever *jou d'esprit* directed against excessive scepticism as applied to the Gospel history. After his marriage in 1821 he settled in his diocese; and in 1822-1825 he delivered a series of lectures, *On the Use and Abuse of Party Spirit in Matters of Religion*, were published in the same year. In August 1823 he removed to Halesworth in Suffolk, but in 1825, having been appointed principal of St Alban Hall, he returned to Oxford. At St Alban Hall Whately found much to reform, and he left it a different place. In 1828 he published a series of *Essays on Some of the Peculiarities of the Christian Religion*, followed in 1828 by a second series *On some of the Difficulties in the Writings of St Paul*, and in 1830 by a third *On the Errors of Romanism traced to their Origin in Human Nature*. While he was at St Alban Hall (1826) the work appeared which is perhaps most closely associated with his name—his treatise on *Logic*, originally contributed to the *Encyclopaedia Metropolitana*, in which he raised the study of the subject to a new level. It gave a great impetus to the study of logic throughout Great Britain. A similar treatise on *Rhetoric*, also contributed to the *Encyclopaedia*, appeared in 1828. In 1829 Whately was elected to the professorship of political economy at Oxford in succession to Nassau William Senior. This was a subject admirably suited to his lucid, practical intellect; but his tenure of office was cut short by his appointment to the archbishopric of Dublin in 1831. He published only one course of *Introductory Lectures* (1831), but one of his first acts on going to Dublin was to endow a chair of political economy in Trinity College out of his private purse.

Whately's appointment by Lord Grey to the see of Dublin came as a great surprise to everybody, for though a decided Liberal Whately had from the beginning stood aloof from all political parties, and ecclesiastically his position was that of
WHAT-NOT—WHEAT

an Ishmaelite fighting for his own hand. The Evangelicals regarded him as a dangerous latitudinarian on the ground of his views on Catholic emancipation, the Sabbath question, the doctrine of election, and certain quasi-Sabellian opinions he was supposed to hold about the character and attributes of Christ, with his view of the church was diametrically opposed to that of the High Church party, and from the beginning he was the determined opponent of what was afterwards called the Tractarian movement. The appointment was challenged in the House of Lords, but without success. In Ireland it was immensely unpopular among the Protestants, both for the reasons just mentioned and as being the appointment of an Englishman and a Whig. Whately's blunt outspokenness and his "want of conciliating manners," which even his friends admit, prevented him from ever completely eradicating these prejudices, while at the same time he met with determined opposition from his own clergy. He ran counter to their most cherished prejudices from the first by connecting himself prominently with the attempt to establish a national and unsectarian system of education. He enforced strict discipline in his diocese, where it had been long unknown; and he published an unanswerable statement of his views on the Sabbath (Thoughts on the Sabbath, 1832). He took a small country place at Redesdale, 4 m. out of Dublin, where he could enjoy his favourite relaxation of gardening. Here his life was one of indefatigable industry. Questions supporting the scheme of education occupied much of his time. But he found leisure for the discussion of other public questions, for example, the subject of transportation and the general question of secondary punishments. In 1837 he wrote his well-known handbook of Christian Evidences, which was translated during his lifetime into more than a dozen languages. At a later period he also wrote, in a similar form, Easy Lessons on Reasoning, on Morals, on Mind and on the British Constitution. Among his other works, the most important of which is, Tracts on Some of the Dangers to Christian Faith (1839), The Kingdom of Christ (1841). He also edited Bacon's Essays, Paley's Evidence and Paley's Moral Philosophy. His cherished scheme of unsectarian religious instruction for Protestants and Catholics alike was carried out for a number of years with a measure of success, but in 1852 the scheme broke down owing to the opposition of the new Catholic archbishop of Dublin, and Whately felt himself constrained to withdraw from the Education Board. From the beginning Whately was a keen-sighted observer of the condition of Ireland, and gave much offence by tearing the state of the Catholic clergy as a measure of justice. During the terrible years of 1846 and 1847 the archbishop and his family were unwarmed in their efforts to alleviate the miseries of the people. From 1856 onwards symptoms of decline began to manifest themselves in a paralytic affection of the left side. Still he continued the active discharge of his public duties till the summer of 1863, when he was prostrated by an ulcer in the leg, and after several months of acute suffering he died on the 8th of October 1863.

Whately was a great talker, much addicted in early life to argument, and he used to hammer out his own views, and as he advanced in life much given to didactic monologue. He had a keen wit, whose sharp edge often inflicted wounds never deliberately intended by the speaker, and a wholly uncontrollable love of joking. Whately often offended people by the extreme unconventionality of his manners. When at Oxford his white hat, rough white coat, and huge white dog earned for him the sobriquet of the White Bear, and he outraged the conventions of the place by exhibiting the exploits of his climbing dog in Christchurch Meadow. With a remarkably fair and broad mind, his sympathies were with the poor, and by his blunt outspokenness on points of difference he alienated many. With no mystical fibre in his own constitution, the Tractarian movement was incomprehensible to him, and was the object of his bitter dislike and contempt. The doctrines of the Low Church party seemed to him to be almost equally tinge with superstition. He took a practical, almost business-like view of Christianity, which seemed to High Churchmen and Evangelicals alike little better than Rationalism. In this they did Whately less than justice, for his religion was very real and genuine. But he may be said to have continued the typical Christianity of the 18th century—that of the theologians who went out to fight the Rationalists with their own weapons. It was to Whately essentially a belief in certain matters of fact, to be accepted or rejected after an examination of "evidences." Hence his endeavour always is to convince the logical faculty, and his Christianity inevitably appears as a thing of the intellect rather than of the heart. Whately's qualities are exhibited at their best in his Logic, which is, as it were, the quintessence of the views which he afterwards applied to different subjects. He wrote nothing better than the luminous Appendix to this work on Ambiguous Terms.

In 1864 his daughter published Miscellaneous Remains from his commonplace book and in 1866 his Life and Correspondence in two volumes. The Anecdotal Memoirs of Archbishop Whately, by W. J. Fitzpatrick (1864), enlivens the picture.

WHAT-NOT, a piece of furniture, derived from the French dièbre, which was exceedingly popular in England in the first three-quarters of the 19th century. It usually consists of slender uprights or pillars, supporting a series of shelves for holding china, ornaments, or trifles of any kind—hence the name. In its English form, although a convenient drawing-room receptacle, it was rarely beautiful. The early mahogany examples are, however, sometimes graceful in their simplicity.

WHEAT (Triticum), the most important and the most generally diffused of cereal grasses. It is an annual plant, with hollow, erect, knotted stems, and produces, in addition to the direct developments from the seedling plant, secondary roots and secondary shoots (tillers) from the base. Its leaves have each a long sheath encircling the stem, and at the junction of the blade or "flag" with the sheath a small whitish outgrowth or "ligula." The inflorescence or ear consists of a central stalk bent zigzag, forming a series of notches (see fig. 1), and bearing a number of flattened spikelets, each of which grows out of each notch and has its inner or upper face presscd up against it. At the base of each spikelet are two empty boat-shaped glumes or "chaff-scales," one to the right, the other to the left, and then a series of flowers, 2 to 8 in number, closely crowded together, the uppermost being abortive or sterile,—indeed, in some varieties only one or two of the flowers are fertile. Each flower consists of an outer or lower glume, called the flowering glume, of the same shape as the empty glume and terminating in a long, or it may be in a short, awn or "beard." On the other side of the flower and at a slightly higher level is the "palea," of thinner texture than the other glumes, with infolded margins and with two ribs or veins. These several glumes are closely applied one to the other so as to conceal and protect the ovary,
and they only separate for a short time when flowering takes place; after fertilization they close again. Within the pale are two minute, ovate, pointed, white membranous scales called "lodicules." These contain three stamens with thread-like filaments and oblong, two-lobed anthers. The stamens are placed round the base of the ovary, which is round or oblong, much smaller than the glumes, covered with down, and surrounded by two short styles, extending from the middle of the vaulted ovary to the stigmas. The ripe fruit or grain, sometimes called the "berry," is the matured state of the ovary and its contents, is oblong or ovoid, with a longitudinal furrow on one side. The ovary adheres firmly to the seed in the interior, so that on examining a longitudinal section of the grain by the microscope the outer layer is seen to consist of epidermal cells, of which the uppermost are prolonged into short hairs to cover the apex of the grain.

Two or three layers of cells inside the epidermis constitute the tissue of the ovary, and these somewhat similar layers which form the coats of the seed. Within these is the albumen or endosperm, constituting the flabby part of the seed. The outermost layer of the endosperm consists of square cells larger and more regular in form than those on each side; these contain aleurön grains—small particles of gluten or nitrogenous matter. The remaining central mass of the seed is composed of numerous cells of irregular form and size containing many starch grains as well as gluten granules. The several layers of cells above referred to become more or less dry and inextricable from one another, forming the substance known as "bran." At the lower end of the albumen, and placed obliquely, is the minute embryo-plant, which derives its nourishment in the first instance from the albumen; this is destined to form the future plant.

The wheat plant is nowhere found in a wild condition. Some of the species of the genus Aegilops (now generally referred to Triticum by Bentham and Hooker and by Haeckel) may possibly have been the sources of our cultivated forms, as they cross freely with wheat. Haeckel considers that there are three species. (1) Triticum monococcum, which undoubtedly grew wild in Greece and Mesopotamia, is cultivated in Spain and elsewhere, and was also cultivated by the aboriginal Swiss lake-dwellers, as well as at Hissarlik, as is shown by the grain found in those localities. (2) T. sativum is the ordinary cultivated wheat, of which Haeckel recognizes three principal races, spelta, dicoccum and tezuc. Spelt wheats (see fig. 2) were cultivated by the aboriginal Swiss, by the ancient Egyptians, and throughout the Roman empire. The variety dicoccum was also cultivated in prehistoric times, and is still grown in Southern Europe as a summer wheat and one suitable for starch-making. The variety tenax includes four sub-races, vulgare (common wheat), compactum, turgidum and durum (see below). (3) The third species, T. polonicum, or Polish wheat, is a very distinct-looking form, with long leafy glumes; its origin is not known. As these varieties intercross with each other, the presumption is that they, like the species of Aegilops, which also intercross with wheat, may have all originated from one common stock.

Basing his conclusions upon philological data, such as the names of wheat in the oldest known languages, the writings of the most ancient historians, and the observations of botanical travellers, De Candolle infers that the wheats planted in Mesopotamia, and that from there its cultivation extended to the early times to the Canaries on the west and to China on the east. In the western hemisphere wheat was not known till the 16th century. Humboldt mentions that it was accidentally introduced into Mexico with rice brought from Spain by a negro slave belonging to Cortes, and the same writer saw at Quito the earthen vase in which a Flemish monk had introduced from Ghent the first wheat grown in South America.

As might be anticipated from the cultivation of the plant from time immemorial and from its wide diffusion throughout the eastern hemisphere, the varieties of wheat—that is, T. sativum—Principia variations—are very numerous and of every grade of intensity. Those cases in which the variation is most extreme some botanists would be disposed to consider as forming distinct species, but others, as De Vilmorin, having regard to the general facts of the case and to the numerous intermediate gradations, look upon all the known derivatives of spelt in illustration of this latter point it may be mentioned that not only do the several varieties come into the other, but their chemical composition varies likewise according to climate and season. According to Professor Church, even in the period of a single year there may be found cases of albuminoid matters in some grains than in others; but on the average the proportion of gluten to starch is as 91 to 100. From the point of view of agriculture it is generally of no great moment which rank be assigned to the various forms. It is only important to take cognizance of them for purposes of cultivation under varying circumstances. Hence we only allude to some of the principal variations and to those characteristics which are desirable, a great range of variation might be induced in the foliage and straw. As it is, some varieties are harder and taller than others, and the straw more solid, varying in colour and having less liability to be "laid"; but in the matter of "tiltering" or the production of side-shoots from the base of the stem, there is much difference. Spring wheats procured from northern latitudes mature more rapidly than those from temperate or hot climates, whilst the reverse is the case with autumn wheats from the same source. The difference is accounted for by the greater amount of light which the plants obtain in northern regions, and, especially, by its comparatively long continuance. The spring wheat, which has the greater working hours for the plants in the day than in more southern climates. Autumn wheats, on the other hand, are subjected to an enforced rest for a period of several months, and even when grown in hot countries remain a considerable time in the earth before being pulled up into growth later in spring—much later than varieties of southern origin. These latter, accustomed to the mild winters of those latitudes, begin to grow earlier and are in consequence liable to injury from spring frosts. Wheats of dry countries and of those exposed to severe winds have, says De Vilmorin, narrow leaves, plant straw, bearded ears, and velvety chaff—characteristics which enable them to resist wind and drought. Wheats of moist climates, on the other hand, have broader leaves, to admit of more rapid transpiration. No doubt careful microscopic scrutiny of the minute differences in the length of plants grown under various conditions would reveal further and more structural modifications of climate. At any rate, it is certain that, as a general rule, the hard wheats are almost exclusively cultivated in hot, dry countries, the soft wheats in colder regions and where soil, turf, or poor soil, turgid (durum forms) and common wheats in plains or in valleys—the best races of wheat being found on rich alluvial plains and in fertile valleys. The wheat used in the neighbourhood of Florence for straw-plating, a short stubby variety with small hard light stalks, is cut close at the beginning of winter and pulled, not cut, about the end of May, before the ear is ripe. In the United Kingdom ordinary wheat is a very old red variety, not suited to rich land, but a short straw, hardy and plump, used by the farmers for straw-plating, the straw being cut some time before the berry ripens. The propensity to "tiller" is of the greatest importance, as it supplies the resources of the farmer. An instance of this is the young early wheat, published by the Philosophical Society of Edinburgh (1812), which is said to have been sown in one of the gardens of the United Kingdom and propagated in a certain number of years from a single seedling plant in the Cambridge botanic garden divided into eighteen parts, each of which was replanted and subsequently again divided, till it produced sixty-seven plants in one season. In March and April of the following year these were again divided.

WHEAT

With regard to the chemical composition of the ripe grain, the Russian chemists have lately been engaged in very varied conditions of manuring, and even where much diversity was apparent in the constitution of the straw. A high or low percentage of nitrogen in the grain was also shown to depend more largely on being allocated a different relative character of the season, than on difference in manure; but it depends more upon the variety than upon soil or nutrition.

The interest of these diversities, as indications of the faculty of variation in place and possibly as clues to the genealogy and origin of the cultivated plant, their practical importance is very great. Some varieties are known to have been developed to a great extent on one description of soil, others on another. Hence the paramount importance of ascertaining by experiment, not only what are the best varieties, but which are the best adapted to the soil and climate. De Vilmorin, and Dehervain have shown the "infinite superiority" in yield over the ordinary wheats of a particular square-headed variety grown on rich soil in the north of France. A good selection of wheats, according to the nature of the soil, demands, says De Vilmorin, intelligence and accurate knowledge on the part of the farmer. If a good variety be grown in poor soil, the result will be unprofitable, while, if bad wheat be grown on good soil, the result may be nil. In botanical collections there exist, it is stated, herbarium specimens or other evidences of plants grown in Norway as far north as lat. 65° (Schueller), in Switzerland an elevation of 1200 ft. above the valley of the Rhone, and in the mighty Archipelago, as well as in Tenerife, the Cape of Good Hope, Abyssinia, Rodriguez, the Philippine Islands and the Malay Archipelago. These widely separated cases of which the advantage be possible, and illustrate the powers of adaptation of the plant. The requirements of the consumer have also to be considered: for some purposes the soft floury wheats, with their large relative proportion of starch, are required; for others the harder wheats, with which the quantity of gluten. With the modern processes of milling, the harder wheats are preferred, for they make the best flour for bakers' use; the bearded varieties also are a rule, harder than the winter wheats. The bearded varieties are less hardy; at any rate they defly the ravages of predatory birds more completely than the unarmcd wheats, and they are preferable in countries liable to storms of wind, as less likely to have their seeds detached. The durum wheats are especially cultivated in Italy for the fabrication of macaroni. Polish wheat is used for similar purposes. Spelt wheats are grown in the colder mountainous districts of Europe; the flour furnished by these is suitable for pastry-making; but, owing to the construction of the grain, it requires special machinery for grinding (see Flour). Wheat begins to grow at a temperature of 5° C. (41° F.) and, if the aggregate temperature, as represented by the sun's daily, has mounted up to 185° F., the germ begins to escape from the husk, if the seed be not deeply buried; but if it is deeply (1896 F.) in the earth, it, and the struggle be not broken. If the seed lies at a depth lower than a foot from the surface, it rarely germinates. The seedling plant ceases to grow if the mean temperature of the atmosphere is below 55°F., or a little above, the flowers are produced. A still higher daily mean is required for the full development and ripening of the grain. The figures here cited are given by Rütter and are calculated for the climate of Paris; but, of course, the same principles apply in the case of other countries. The amount of light and of moisture has also to be taken into account. The fact that the wheat plant grows in less water than other cereals, and therefore does not suffer so much from drought, is one of great importance to the cultivator and furnishes one reason for the greater proportionate culture of wheat in the eastern than in the western counties of England.

The production of wheats may be estimated by simply inspecting the size, consistency, and age of the ears, and the depth of the grain in the ear, or in the case of a large field there may be observed on close inspection plants differing in character from the majority. If seeds of these "sporting" plants be taken and grown in another field, they probably result in a great deal of variation. If they do, and the same process of selection be continued, the variation becomes in time: fixed, though it is always more or less slow in its progress. The object of plant breeders is systematically selecting the best grains from the best ears, Major Hallett succeeded in introducing "pedigree wheats" of fine quality. But even greater results may be expected from cross-breeding, or

Adaptability to soil and locality.

In the classification of cultivated wheat has occupied the attention of many botanists and agriculturists.

The classification adopted by Henry de Vilmorin in his "Les Blés meillers" (Paris, 1881) is based, in the first instance, on the nature of the ear: when mature or stem remains unbroken, as in the true wheats, or it breaks into a number of joints, as in the spelt wheats.

In the first class the ripe grain readily detaches itself from the ear-scales, while in the spelt the type is firm, or at least, firm or firmly, or not readily separable from them.

The true wheats are further subdivided into divisions, according to whether or not the grains are glabrous, T. Turgidum, hard wheats (T. durum) and Polish wheats (T. polonicum).

In the hard wheats the seed is much more, and the seed is turgid and floury, as the common wheats. In the hard wheats the outer glumes are keeled, shortly pointed, awned, and the seed is elongated and of hard glassy texture, somewhat translucent, and easily broken, owing to its toughness. These seeds are richer in nitrogen than the common and turgid wheats, so that an approximate notion of the richness in albuminoids may be obtained by simply inspecting the size, consistency, and age of the grains, and the depth of the grain in the ear, or in the case of a large field there may be observed on close inspection plants differing in character from the majority. If seeds of these "sporting" plants be taken and grown in another field, the ear may result in a great deal of variation. If they do, and the same process of selection be continued, the variation becomes in time: fixed, though it is always more or less slow in its progress. The object of plant breeders is systematically selecting the best grains from the best ears, Major Hallett succeeded in introducing "pedigree wheats" of fine quality. But even greater results may be expected from cross-breeding, or

In the United Kingdom, has very large lanceolate glumes, longer than the spikelet, and elongated glaessy seeds. Further subdivisions are made, according to the presence or absence of awns (bearded and beardless wheats), the colour of the ears (white, brown, or red), the texture of the ears (glabrous—i.e. smooth— or downy) and the colour of the seed or "berry." In the jointed or spelt wheats the distinctions lie in the presence of awns, the direction of the awns, the nature of the awns (bearded, cut, awnless, or inward), the form of the ear as revealed on a cross-section, and the entire or cleft palea. As illustrating the fact of the occasional instability of these varieties, Professor Church mentions that a single grain will be sometimes horns and partly opaque and floury, in which case its composition will correspond with its aspect. The division into spring wheats and winter wheats is an agricultural one solely. Any variety may be changing or being changed at the time at which it is sown. In the summer wheats it may often be observed that the median florets do not fill out so fully as in the autumn wheats; there is a frequent tendency in the spike to branch or become wound about, which is manifested to a less degree in other forms. The Egyptian, or so-called "mummy" wheat is of this character, the lower part of the spike branching out into several subdivisions. The lower portion of the seed-bearing branches may at first sight be considered advantageous; but in practice the quality of the grain is found to be inferior, as if the force that should have been devoted to the maturing of the grain were, in a measure, diverted and expended in the production of additional branches to the spike.
The fertilization of the flowers of one description of wheat by the pollen of another. This has been attempted by Shireef, Le Couturier, MacFarlane, and others, notably by H. de Vilmorin and Messrs Carter. Under natural circumstances wheat is self-fertilized; that is to say, the pollen of any given flower impregnates the stigma and ovule of the same flower; the glumes and coverings of the flowers prevent contact with pollen of other stamens, and this in such a way as to prevent the access of insects and to ensure the deposit of the pollen upon the stigmas of the same flower. This process of self-fertilization is the sole mode of pollen transmission in the wild state; but the occasional presence of varieties in a wheat-field shows that cross-fertilization is sometimes secured. The stamens of the wheat plant may frequently be seen protruding beyond the edges of the glumes, and on the application of a little moisture to this they open and lay bare the pollen. It is true that cross-fertilization was the rule; but on closer examination it will be found that the anthers are empty or nearly so, and that they are not protruded till after they have deposited the pollen upon the stigmas. It follows, therefore, that cross-fertilization occurs at the time of flowering, and which permits the egress of the useless stamens after that operation, occurs only under certain conditions of temperature, when the heat, in fact, is sufficient to cause the blossoms of the flower to become turgid and thus to press apart the glumes. A temperature of about 75 °F. is found by Messrs Carter to be the most favourable. From what has been said it will be evident that the artificial fertilization of wheat is a very delicate operation. The glumes have to be separated and the anthers cut away before the pollen is fully formed, care being taken at the same time not to injure the stigma, and specially not to introduce, on the cutters or other part of the cutting process, the pollen from another variety. Different experiments have shown that all the varieties will intercross, and that even such a distinct form as the Polish is no exception. From this it is evident that cross-fertilization can be achieved from hybrids, and are to be comprised within one species. In the progeny of these crossed wheats, especially in the second generation, much variation and difference of character is observable—a phenomenon commonly noticed in the descendants from crosses and hybrids, and styled by Naudin "irregular variation." Sometimes characteristics appear in the crossed wheats which are not found in the parent varieties, although they occur in other wheats. Thus, De Vilmorin records the presence of turgid wheats among seedlings raised from a common wheat fertilized with the pollen of a hard variety, and felt wheats among the descendants of a common crossed with a turgid wheat. The cultivation of the wheat with bread, has increased enormously since the extension of railways has made possible the transportation of grain for great distances (see Grain Trade). Of late years the increase of production has been most notable in southern Russia, Argentina, Australia, India, and in North America.

American Wheat-Farming.—That wonderful agricultural region, extending from the international line on the north to the 37th parallel, and from the Atlantic Ocean to the 100th meridian, and comprising 26 states, produces 76% of the American wheat crop. This region, which contains only 30% of the land surface of the country, but embraces 60% of its total farm area and 70% of its improved farm acreage, is the greatest cereal-producing region of the world. Besides wheat, it produces 82% of the total corn crop, 91% of the total oat crop and 83% of the total hay crop of the United States. The methods pursued in the eastern portion of this region are similar to those used in other parts of the world; but in the north-western portion wheat-growing is carried on on a gigantic scale, and by methods almost unknown anywhere else. The best illustration of the great or "bonanza" wheat farms, as they are called, are found along the Red River (of the North), where it flows between the states of North Dakota and Minnesota.

The wheat grown in the United States is of two distinct kinds. One is the large-kernel winter wheat of the Eastern states; the other is the hard spring wheat. The hard winter wheat of the "bonanza" farms is a native variety grown in Minnesota and the two Dakotas. For flour-making this wheat is considered the best in the world. During the season of 1890 the product of hard spring wheat amounted to nearly 250,000,000 bushels, or two-fifths of the entire wheat product of the United States. Of this, Minnesota and the two Dakotas alone produced 200,000,000 bushels. Minnesota is the greatest wheat-producing state in the Union. Her fields in 1890 covered 5,000,000 acres, and she produced nearly 86,000,000 bushels, which is twice the entire production of all Australia, and more than that of Great Britain. Minnesota, however, is situated on the southern border of the Dakotas the farms are devoted almost exclusively to wheat-growing. Many of them contain from 3000 to 10,000 acres.

The country is a very level one, making it possible to use all kinds of machinery with great success. As there are no mountains or swamps, there is here very little waste land, and every square foot of the vast wheat fields can be made productive.

The first characteristic of the "bonanza" wheat farm is the machinery. The smallest agricultural implement used upon them is a plough, and the largest is the elevator. A ten-mule plough can follow each other around, till two there are machines of all sizes adapted to the needs of the particular work. Let us assume the conditions prevailing upon a bonanza farm of 5000 acres, and briefly describe the process of wheat production from the ploughing of the land to the delivery of the grain in the final market.

These great wheat farms were established upon new lands sold directly to capitalists by the railroads. The lands became the property of the railroads largely through government grants, and they attracted capitalists, who bought them in large bodies and at low prices. The improvements made upon them consist of the cheap wooden dwellings for the managers, dormitories and dining-halls for the men, stables for the horses, and sheds and workshops for repairing machinery. Very little of the land is under fence. Since the desirable lands of the country have been occupied, the prices of these lands have advanced slowly, with the result that the big farms are being divided up into small holdings. After a generation or two, if land continues to rise in the market as it has recently, the bonanza farms will become a thing of the past. At present the best of these lands in the valley of the Red river (of the North) are worth from $30 to $40 an acre, and the average price is about $25 an acre more. A farm is not considered a big one unless it contains from 2000 to 10,000 acres at least. There are, of course, many small farmers owning from two to five sections (640 acres in each section), but their methods are more like those of the small farmers in the eastern United States or on the continent of Europe. It is necessary to own a large body of land in order to be able to use the machinery and methods here described. It is hard to convey a just notion of the size of these farms. They stretch away as far as the eye can reach in every direction, making it difficult even for the visitor to conceive their size. The distances across wheat fields are so great that even horseback communication is too slow. The farms are separated into divisions, and lodging-houses and dining-halls and barns are scattered over them, so as to keep the workmen and teams near the scene of their labour. The men living at one end of the farm may not see those at the other for months at a time. Even then it is necessary to take the meals to the men in the fields rather than allow them to walk or ride to the dining-halls. It is not an unusual thing for a working crew to find themselves at the dinner hour 2 m. from their hall.

First, after burning the old straw of the previous year—which is real labour in itself, so enormous is its bulk—comes the ploughing. This begins in October. The plough used has a 16-in. share, turns two furrows, and is drawn by five horses. Each plough covers about 250 acres in a season, travelling an average of 20 m. a day. The ploughing begins in October, and continues a month or six weeks, according to the season. The ploughs are driven in "gangs" under the eye of a superintendee, who rides with them. Ten of these gangs follow each other, and plough a whole section. If one stands a few rods ahead of them they seem to be following one another in a line; but, if one stands to the right of the "gang," one sees that the line is broken, and that the second plough follows the first a little further in the line. This gives a regular number. Experience shows that it costs about 70 cents an acre to plough the land in this way. About forty men are employed upon a farm of 2000 acres during the ploughing season. The men are paid by the month, and receive about $25, including their board. They breakfast at five o'clock, take an hour for their dinner at noon—usually in the field—and have their supper at seven. At the end of this ploughing season the farm is kept clear of weeds, and is ready for the next season. Only eight or ten are kept on a farm of this size throughout the year. The other men go back to their homes or to the factories in the cities, where they wait the harvesting and threshing season. The eight or ten men are selected to remain, one for the ploughing, one as overhauling machinery, or helping the carpenter and blacksmith, or looking after the horses. The wheat region is a country of heavy snows, and of severe, dry cold; but when the snows begin to melt away, and by April the ploughed land is dry enough for
WHEAT

The harvest. The harrowing is done with 25-ft. harrows, drawn by four horses, and operated by a single man. One man can harrow 60 to 70 acres a day.

The seedling follows immediately with four-horse press drills that cover 12 ft. The drills and ploughs were. Each drill will go from 20 to 25 m. a day. 

Seeding. When the weather is good the seeding upon a 5000-acre farm will be done in twenty or twenty-five days. It is usual to seed a half-acre of wheat to the acre of land, to avoid the risk of the wheat being planted too near the edge of the field. The purpose is carefully selected after the harvest of the previous year, and is thoroughly cleaned of foreign seeds. Through years of cultivation, the wheat has been sorted and only the hardiest varieties of wheat have been used. This has resulted in a yield of 15 bushels per acre, which is well adapted to the soil and climate of this region. It has been found more profitable to use the native "blue stem" or "Scotch-Fife" wheat than the seed from any other country, or even from the neighboring states. Counting the cost of seed, the wheat will be worth at least $1 an acre to harrow the ground and plant the wheat.

When the planting is done the extra laborers are discharged again, and the regular ones are put to work on the corn, oats and millet, in order to feed the horses. The men who do the most important work are all temporary laborers. They come from the cities of the east or the farms of the south. They begin with the early harvest in Oklahoma, and work northwards up the Missouri and the Red river until the season closes in Manitoba. They are not tramps, but steady, industrious men, with few bad habits and few ambitions. On well-managed farms drinking and gambling are forbidden. Their accommodations are not like those of the old-time laborers; there is no lechery on the farm, and no use of tobacco. They are not ashamed of the good things of life, but they do not use them to excess. They have a handsome appearance, and are in good health. Their dormitories are usually comfortably furnished, their dining-halls clean and well kept, and their workboys are not likely to have a chance to go to sleep while they are at work. Many a strike has occurred in the midst of the harvest because the quality or quantity of the food served was not what it ought to have been. The largest part of this food is brought from the cities. Some portions of it are sent by rail directly to the farms upon the farms; but the canned beef, bacon and groceries come from the cities. It is estimated that it costs 35 cents a day to feed each laborer. Farmers say that a good name in these respects enables them to get the choice of workmen, and that no money brings such sure returns as that expended in the bedrooms and upon the food.

The harvest labourers begin to arrive from the south about the middle of July, and by the end of this month the harvest is at its height. A farm of 5000 acres will use 75 or 100 extra men. With the men comes the new machinery in train leads. The new machinery in this region is now so well worked over that a first-class culture is annually sold in this region. The wheat farmers say that it does not pay to take undue care of old machinery, that more money is lost in repairing and tinkering an old machine than would be paid for a new one. The result is that new machinery is bought in very large quantities, used until it is worn out or cannot be repaired without considerable work, and then left in the fields to rust. The cost of cast-iron can be seen already upon many of the largest of these new machines. Of course a great many extra parts are bought to take the place of those which break most frequently, and some men are always kept at work repairing machinery in the field. One of the big 10,000-acre farms in this region has a constant load of two or three single-horse ploughs, a line of eight combines and ten elevators. The harvesters vary in size according to the character of the land. Upon the rough ground there are the ordinary thresher and thrasher, and the ordinary thresher and thrasher and harrow. The ordinary thresher and thrasher and harrow is a large one, with a line of six or eight ploughs and a line of eight combines and ten elevators. The harvest labourer earns $10 a week everywhere in America. The bonanza farmer expects one machine to cut at least 250 acres, and three men are required for each of them. The harvest lasts from ten days to three weeks, according to the weather. Including the labour and the wear and tear, it costs about 60 cents an acre to harvest wheat.

The wheat is not stacked as in the Eastern states and in England, but stands upright in shocks in the field. The grain cures very rapidly in the dry climate, so that by the time the wheat is ready for the thrasher at the other. The shocks of wheat are hauled directly to the thrasher and fed into the self-feeder. It usually takes a day and a quarter to thrash the wheat which it took a day to cut. The thrasher can usually cut a half-acre a day with one set of horses, and can cut a half-acre a day at 35 cents an acre. The wheat ordinarily grown upon 2500 acres, so that a 5000-acre farmer would have at least two machines running at the same time. Time is money, and it is a capital investment to have a rainfall of enough grain in one night to buy seven machines. The threshing season is thus a time of great pressure and of extensively active work. The wheat straw is worse than a waste product—it is a great nuisance upon the farm, and is objectionable for fuel and for bedding the stock: but the bulk of it is dragged away from the threshing machine by machinery, and left lying in great heaps until an opportunity is afforded for burning it. This is usually done immediately before the ploughing in the autumn. The grain falls from the spout of the thrasher into the box-wagon, which carries it to the elevator. The elevator is placed at the railway station, and is usually owned by the bonanza farmer.

From the time the sheaves of wheat are tumbled into the wagon until the flour reaches the hands of the cook, no hand touches the wheat. The wheat is carried from the elevator to the grist-mill. When the box-wagons reach the elevator the loosing of a bolt dumps the grain into the bin, where it remains until the pulling of a lever lets it into the cars. Every pound of it is carefully weighed, and makes his plans for the next year, so as to show the exact product of each division of the farm. After the rush of the threshing is over the farmer studies these books carefully to see how his land is doing, and makes his plans for the next year, so as to rest or strengthen those divisions which are failing. It costs about $1.50 an acre to thresh the grain and put it into the elevator. This sum, added to the estimated cost of the other processes mentioned above, makes the total cost of growing an acre of grain about $3.80. This includes the cost of labour, seed and wear and tear of machinery, but does not include the interest on land or plant. The taxes on land will average 25 cents an acre. The farmers estimate that the other improvements, the waterworks, elevators, insurance, horse feed, &c., will make this up to $6 an acre. The best of these farms will yield 20 bushels to the acre. This makes the wheat cost 30 cents a bushel. During the last five years the average farm-selling price of wheat in the North-West has been 58 cents. An acre thus produces $11.60, making a gross profit of $5.60. Still to be provided for is the interest on the operating expenses for the year. The farmer is allowed 8% on his operating expenses and the capital invested in land, improvements and machinery, at $30 per acre, which makes $1.80 more, or a total interest charge of $2.48. This is the normal 8% on the capital invested in the land, plant and operating expenses. But we have described the conditions on one farm that are accounted for, and entered upon the books. This action is not over 18 bushels, and the average expenses would be higher than those given.

Every bonanza farmer’s office is connected by wire with the markets at Minneapolis, Chicago and Buffalo. Quotations arrive hourly in the selling season, and the superintendent who keeps in close touch with his agents in the wheat-pits of these and other cities. When the instrument tells him of a good price, his agent is instructed to sell immediately. The farmer is never little, for the wheat is kept fully informed as to the drought in India, the hot winds in the Argentine and the floods of the Danube. Any occurrences in these distant parts of the world are known to him in a surprisingly short time. The world’s great wheat fields almost lie within his sight, so well does he know the conditions that prevail in them.

Ten days are allowed for delivery, so that he can usually ship the wheat after it is sold. In the early days of wheat-farming the bonanza farmer often speculated, but experience has taught him that he had better leave this to the men in the cities, and content himself with the profits which the production of his own wheat will bring him. The great elevator centres are in Duluth, St Paul, Minneapolis, Chicago and Buffalo. These elevators have a storage capacity of from 100,000 to 2,500,000 bushels. The new ones are built of steel, operated by steam or electricity, protected from fire by pneumatic water-pipes, and have complete machinery for drying and sorting the wheat whenever it is necessary. The elevators are provided with long spouts containing movable buckets, which can be lowered into the hold of a grain-laden vessel. The wheat is shovelled into the pathway of the huge steam shovels, which draw the wheat up to the elevators, where the buckets seize it, and carry it upwards into the elevator, and distribute it among the various bins according to grade. A cargo of 200,000 bushels can thus be unloaded in two hours, while spouts on the other side of the elevator reload it into cars, five to ten at a time, filling a car in from five to ten minutes, or the largest canal boat in an hour. The entire work of unloading, storing and reloading adds only one cent to the price of a bushel of wheat.

The great wheat-growing states like Minnesota have established systems of inspecting and grading wheat under state supervision. In Minnesota the system is carried out by the Railroad and Warehouse Commission (88), which fixes and defines the different grades of wheat and directs the work. At present there are 18 grades recognized in this state. The first is described as "No. 1, hard spring wheat, sound, bright and well cleaned, composed mainly of hard "Scotch-Fife," weighing not less than 58 lb to the measured
WHEAT

581

bushel." The second grade is known as "No. 1, northern spring wheat, sound, and well cleaned, composed of the hard and soft varieties of spring wheat." So the varieties run—"No. 2, northern"; "No. 3, northern," &c.—down to the 18th, which is "no grade." The official inspectors examine, grade, and sample the wheat in the cars in which it is received at the great markets or elevators. The cars are sealed at the point of original shipment. The first thing, therefore, is to examine the seal to see that they are unbroken. The inspector then samples and examines the wheat, and enters the grade upon a blank opposite the number and letters of the car. His tag and sample go to the wheat exchange or chamber of commerce, where they are exposed in small tin pans, and form the basis of the trading. A few years ago the wheat received from the north-west was very clean indeed, but since the new land has all been cultivated the fields are growing more weedy, with the result that the wheat brought in is becoming mixed with oats and seeds of weeds, requiring more careful separation and inspection. The inspector has finished his work when the cars are rescaled with the state seal, and await orders of the purchaser. The delay will not ordinarily be more than one day. The commission keeps complete records and samples of each car until the wheat has passed entirely out of the market. When disputes occur as to the grade they can thus be instantly settled. If the grade is changed after a second examination the state pays the expense of the inspection; if not, it is paid by the agent who raises the objection. Only about 5% of the samples are ever reinspected, and in less than 2% of these is the grade changed. The commission, collecting the small fee of 20 cents a car for its services, as inspector, and later weighs all the wheat as it is distributed into the elevators. This small charge pays all the expenses.

The transportation of the wheat from the fields of the north-west to the seaport is a business of tremendous magnitude.

Transportation.

Most of this wheat goes by way of the lakes through Sault Sainte Marie canal to Buffalo, where it is shipped by rail or inland canal to New York, Philadelphia or Baltimore. Duluth, on Lake Superior, is, surprising to say, the second port in the United States in point of tonnage. The Sault Sainte Marie canal passes two and a half times as much tonnage during the eight months it is open as the Suez canal passes in the entire year. The cheapest transportation in the world is found upon these lakes, the rate being only three-fourths of a mill per ton of wheat per mile. The greater lake vessels, called "Whalebacks," carry cargoes up to 250,000 bushels, a bulk difficult to conceive. 700 bushels is a car-load. At that rate the cargo of 250,000 bushels will fill 360 American cars, or 9 trains of 40 cars each. At 20 bushels to the acre, this single cargo would represent the yield of two and a half farms of 5000 acre acreage and the yield. The fact that these States contain, in addition to the railways of the north-west have a monopoly of the business of hauling wheat, with the result that it costs 20 cents to ship a bushel of wheat from the Dakota field to Duluth, which is as much as it costs to forward it from Duluth to Liverpool. The bushel of wheat, or an equivalent amount of flour, can be shipped from Minneapolis or Duluth to almost any point in western Europe for from 20 to 25 cents.

What are the prospects of wheat production in the United States? In his presidential address before the British Association for the Advancement of Science (1900), Sir William Ramsay painted a rather dark picture of the future of the world's wheat production. Among other things he said, "It is almost certain that within a generation the ever-increasing population of the United States will consume all the wheat grown within its borders, and will be driven to import like ourselves. Americans think that this statement is altogether too pessimistic; yet the United States will, for example, have to import wheat to supply the needs of New York City alone. Our cities are growing and the population is increasing so rapidly that it is probable that the United States will by 1933 have a population of 133,000,000. If we assume that all the people in the United States will eat 700 pounds of wheat per person, which is the average consumption of the people of the United States, we find that in 1933 the United States will have to import 140,000,000 bushels of wheat. This is an increase of 13,600,000 bushels over the present average of the United States of America. However, we do not have to go as far as 1933 to see that the United States will be driven to import wheat. The United States is growing so rapidly that it is probable that by 1910 the United States will have to import 50,000,000 bushels of wheat. This is an increase of 12,000,000 bushels over the present average of the United States of America.

Prospect of wheat production.

We have no similar calculation of loss for Great Britain, where wheat is not so much grown, but it is well known that there is a continual, serious obstruction of the crop by rust. The rust fungus, Puccinia graminis, is a Uredine belonging to the heterocorous group, that is, one that passes from one host to another at different stages of its life. In its green, vegetative stage it is relatively small and green and immature, the rust makes its appearance as orange-red spots or streaks on the stalks and leaves. These coloured spots are due to the presence of a sorus or layer of countless spores, whose spores, when mature, are easily detached, and are carried by insects or by the wind to other wheat-plants. If infection takes place, other sori are formed in ten days or a fortnight under favourable conditions of moisture and warmth.
Towards the end of the summer the uredospores are replaced by the winter resting-spores, called teleutospores, which are larger, thicker-walled and darker in colour. These teleutospores remain inactive on the straw until spring, when they germinate in manure heaps or on moist ground and produce minute sporidia, which are conveyed by air currents to the alternate host, in this case a barley. In due time the fungus, known as *Aecidium Berberidis*, appears on the barley leaves in the form of small cluster-cups on *aecidia*, each of which is filled with chains of orange-coloured *aecidiospores*. Infection of the leaves of the young wheat plants follows on the scattering of the aecidiospores: a sorus of the rusty uredospores is produced, and the life-cycle is complete.

Though this is the normal and complete development of *Puccinia graminis*, it is not invariably followed. In Australia, for instance, the barley is an imported plant and of rare occurrence, yet rust is very abundant. Teleutospores of heterocous rusts never reach the host on which they are produced, so that in many cases the other flowering wheat plants. It is impossible to detect the first infection or to cleanse the seed; the only remedy is to procure seed from a smut-free source, and to further guard against it by growing all smutted cases, or by gathering all smutted plants during the disease by keeping all smutted plants until the seeds have matured or dispersed.

*Ustilago* (cf. smutted fungus) is one of the more common rusts to be found in Europe. It is pale brown, is generally but not always produced, and Teleutospores, but stinking smut of wheat, is so-called because the bunted grain has a disagreeable odour of stale breading. The spores from bunted flour is dark in colour, and both unpalatable and unwholesome. The spores of the fungus remain in the soil or in manure-heaps until spring, when they germinate and attack the first green leaves of the host plant. The after development is similar to that of smut, and the seed grain becomes a mere mass of fungus spores. Much can be done in this case to clean the seed before sowing by immersing it in hot water or in some solution that will kill the spores without injuring the grain.

Other parasitic fungi of less economic importance occasionally do considerable damage. *Erystale graminis*, a mill of grass, has caused great loss in various countries; *Diophila graminis* sometimes causes deformities of the leaves and inflorescence; another somewhat similar fungus, *Ophiobolus graminis*, attacks the leaves and stalks near the ground, completely destroying the plants.

*Helminthosporium gramineum*, a disease of barley, has been recorded as growing on wheat; it forms long, narrow dark-brown streaks on the leaves, which wither and die. The lower leaves are usually the only ones attacked, and the yield of grain has not been seriously affected.

**WHEATEAR**, *a bird's name, perhaps of doubtful meaning,* though J. Taylor, the "water poet" (d. 1634), in whose writings it seems first to occur, and F. Willughby, explain it (in the words of J. Ray, the latter's translator) as given "because in the time of wheat harvest they wax very fat". The wheatear, *Saxicola graveni*, is one of the earliest migrants of its kind to return to its home, often reaching England at the end of February and almost always by the middle of March. The cock bird, with his bluish grey back and light buff breast, set off by black caroverts, wings, and part of the tail, is rendered still more conspicuous by his white rump as he takes short flights in front of those who disturb him, while his sprightly actions and gay song harmonize so well with his delicately-tinted plumage as to render him a welcome object to all who delight in free and open country life. When alarmed, the wheatear has a sharp little note that sounds like *chat*; and this has not only entered into some of the local names of this species and of its allies, but has caused all to be frequently spoken of as "chats". The nest is constantly placed under ground; the bird takes advantage of the hole of some other animal, or the shelter of a clod in a fallow-field or a recess beneath a rock. A large amount of soft material is therein collected, and on them from 3 to 8 pale blue eggs are laid.

The wheatear has a very wide range throughout the Old World, extending in summer far within the Arctic Circle, from Norway to the Lapland and Yana valleys, where in winter Alaska and Siberia are beyond the Equator in and India. But it also breeds regularly in Greenland and some parts of North America. Its reaching the former and the eastern coast of the latter, as well as the Bermudas, may possibly be explained by the drifting of individuals from Iceland; but far more interesting is the fact that its continued seasonal appearance in Alaska without ever showing itself in British Columbia or California, and

---

1 The vulgar supposition of its being an euphemism of an Anglo-Saxon name (cf. Bennett's ed. of White's *Nat. Hist. Selborne*, p. 99, note) must be rejected until evidence that such a name ever existed be adduced. It is true that *whitate* (cf. Dutch *Witsaat* and *Freda*; *Gildane*) is given by Olaus *Gildes* in 1611; but the older names, according to Turner, in 1514, of "clotburd" (=clod-bird) and smatch (=chat) do not favour the usual derivation. "Fallow-chat" is another old name still locally in use, as is "coney-chuck."
without ever having been observed in Kamechatka, Japan or China, though it is a summer resident in the Tchuktschi peninsula. Hence it would seem as though its annual flights across Bering’s Strait might connect it with migratory movement that passes to the north and west of the Stanovoi range of mountains.

Many species more or less allied to the wheatear have been described. Some eight are included in the European fauna and the majority are inhabitants of Africa. Several of them are birds of the desert; and here it may be remarked that, while most of these exhibit the sand-coloured tints so commonly found in animals of like habitats, few assume a black plumage, which, as explained by H. B. Tristram, is equally protective, since it assimilates them to the deep shadows cast by projecting stones and other inequalities of the ground.

Amongst genera closely allied to Saxicola are Pratincola, which comprises among others two well-known British birds, the stonechat and whinchat, P. rubicola and P. rubetra, the latter a summer migrant, practised at the nesting-season, a small chestnut, ruddy breast, and white collar and wing-spot of the cock render him a conspicuous object on almost every furge-grown common or heath in the British Islands, as he sits on a projecting twig or flits from bush to bush. This bird has a wide range in Europe and several other species, more or less resembling it, inhabit South Africa, Madagascar, Réunion and Asia, from some of the islands of the Indian Archipelago to Japan. The wheatear, on the other hand, much more affects enclosed lands, and with a wide range has no very near ally. The wheatear and its allies belong to the sub-family Turdinae of the thrushes (q.v.).

WHEATLEY, FRANCIS (1747-1801), English portrait and landscape painter, was born in 1747 at Wild Court, Covent Garden, London. He studied at Shipley’s drawing-school and the Royal Academy, and won several prizes from the Society of Arts. He assisted in the decoration of Vauxhall, and aided Mortimer in painting a ceiling for Lord Melbourne at Brocket Hall (Hertfordshire). In youth his life was irregular and dissipated. He eloped to Ireland with the wife of Grease, a brother artist, and established himself in Dublin as a portrait-painter, executing, among other works, an interior of the Irish House of Commons. His scene from the London Riots of 1780 was admirably engraved by Heath. He painted several subjects for Boydell’s Shakespeare Gallery, designed illustrations to Bell’s edition of the poets, and practised to some small extent as an etcher and mezzotint-engraver. It is, however, as a painter, in both oil and water-colour, of landscapes and rustic subjects that Wheatley is best remembered. He was elected an associate of the Royal Academy in 1790, and an academican in the following year. He died on the 28th of June 1801. His wife, afterwards Mrs Pope, was known as a painter of flowers and portraits.

WHEATON, HENRY (1785-1848), American lawyer and diplomatist, was born at Providence, Rhode Island, on the 27th of November 1785. He graduated at Brown University in 1802, was admitted to the bar in 1805; and, after two years’ study abroad, practised at Providence (1807) and New York City (1812-1827). He was a justice of the Marine Court of the city of New York from 1815 to 1819, and reporter of the United States Supreme Court from 1816 to 1827, aiding in 1825 in the revision of the laws of New York. His diplomatic career began in 1827, with an appointment to Denmark as chargé d’affaires, followed by that of minister to Prussia, 1837 to 1840. During this period he had published a Digest of the Law of Maritime Captures (1815); twelve volumes of Supreme Court Reports, and a Digest; a great number of historical articles, and some collected works; Elements of International Law (1836), his most important work, of which a 6th edition, with important additions, was published in 1868 by W. B. Lawrence and an eighth by R. H. Dana (q.v.); Histoire du Progrès du Droit des Gens en Europe, written in 1838 for a prize offered by the French Academy of Moral and Political Science, and translated in 1845 by William B. Lawrence as A History of the Law of Nations in Europe and America; and the Right of Visit and Search (1842). The History took rank at once as one of the leading works on the subject of which it treats. Wheaton’s general theory is that international law consists of a series of rules of conduct which reason dictates, as consonant to justice, from the nature of the society existing among independent nations, with such definitions and modifications as may be established by general consent.”

In 1846 Wheaton was requested to resign by the new president, Polk, who needed his place for another appointment. The request provoked general condemnation; but Wheaton resigned and returned to the United States. He was called at once to the Harvard Law School as lecturer on international law; but he died at Dorchester, Massachusetts, on the 11th of March 1848.

WHEATSTONE, SIR CHARLES (1802-1875), English physicist and the practical founder of modern telegraphy, was born at Walthamstow, near Leyton, in February 1802, and was removed at the age of twelve to that city. In 1806 the family removed to London. Wheatstone’s education was carried on in several private schools, at which he appears to have displayed no remarkable attainments, being mainly characterized by a morbid shyness and sensitiveness that prevented him from making friends. About 1816 he was sent to his uncle, a musical instrument maker in the Strand, to learn the trade; but with his father’s countenance he spent more time in reading books of all kinds than at work. For some years he continued making experiments in acoustics, following out his own ideas and devising many beautiful and ingenious arrangements. Of these the “acoucrystrophone” was one of the most elegant—a light box, shaped like an ancient lyre and suspended by a metallic wire from a piano in the room above. When the instrument was played, the vibrations were transmitted silently, and became audible in the lyre, which thus appeared to play of itself. On the death of his uncle in 1823 Wheatstone and his brother succeeded to the business; but he never seems to have taken a very active part in it, and he virtually retired after six years, devoting himself to experimental research, at first chiefly with regard to sound. Although he occasionally read a paper to the Royal Society with remarkable success, he never became a lecturer on account of his shyness. Hence many of his investigations were first described by Faraday in his Friday evening discourses at the Royal Institution. By 1834 his originality and resource in experiment were fully recognized, and he was appointed professor of experimental philosophy at King’s College, London, in that year. This appointment was inaugurated by two events—a course of eight lectures on sound, which proved no success and was not repeated, and the determination by means of a revolving mirror of the speed of electric discharge in conductors, a piece of work leading to enormous consequent results. The work, which had suggested the possibility of utilizing it for sending messages; and, after many experiments and the practical advice and business-like co-operation of William Fothergill Cooke (1806-1879), a patent for an electric telegraph was taken out in their joint names in 1837. Wheatstone’s early training in making musical instruments now bore rich fruit in the continuous designing of new instruments and pieces of mechanism. His life was uneventful except in so far as the variety of his work lent it colour. He became a fellow of the Royal Society in 1837; in 1847 he married; and in 1868, after the completion of his master-piece, the automatic telegraph, he was knighted. While in Paris perfecting a receiving instrument for submarine cables, Sir Charles Wheatstone caught cold, and died on the 19th of October 1875.

Wheatstone’s physical investigations are described in more than thirty-six papers in various scientific journals, the more important of which are in the Philosophical Transactions, the Proceedings of the Royal Society, the Comptes rendus and the British Association Reports. They naturally divide themselves into researches on sound, light and electricity, but extend into other branches of physics as well. But his best work by far was in the invention of complicated and delicate mechanism for various purposes, in the construction of which he employed a staff of workmen trained to the highest degree of skill. For his work on the telegraph he was not only knighted, but was unequalled, except perhaps by Charles Babbage. A cryptographic machine, which changed the cipher automatically and printed a message, entirely unintelligible until translated by a duplicate machine and a key, was one of the earliest devices of this kind. Wheatstone’s physical investigations on sound had given him a great fascination for Wheatstone; he studied it deeply at one time, and deciphered many of the M.S. in the British Museum which had been done by the later interpreters. In his principal work was a research on the transmission of sound through solids, the explanation of Chladni’s figures of vibrating solids, various investigations of the principles of acoustics and the mechanism of hearing, and the invention of new musical instruments, e.g. the concertina (q.v.).
WHEATSTONE'S BRIDGE

The kaleidophone, intended to present visibly the movements of a synchronous body, consisted of a flowing wire or rod carrying a silvered bead reflecting a point of light, the motions of which, by persistence of the successive images on the retina, were thus represented in curves of light. The light was reflected from a series of papers on the eye, on the phenomena of vision, on binocular vision, including the invention of one of the popular scientific instruments, the stereoscope (q.v.), and on colour. The polar clock, devised for use in place of a sun-dial, applies the fact that the polarization of sky light is always 90° from the position of the sun; hence by measuring the azimuthal angle of the plane, even when the sun is below the horizon, correct apparent solar time may be obtained. In 1833, in a paper on "The Prismatic Decomposition of Electrical Light," he proved that sparks from different metals give distinctive spectra, which afforded a ready means of discriminating between them. But it is by his electrical work that Wheatstone is best remembered. He not only guided the growth of scientific telegraphy on land wires, but made the earliest experiments with submarine cables, foreseeing the practicability of this means of communication as early as 1840. He devised the "A, B, C" telegraph instrument, the automatic transmitter, by which messages may be sent at the rate of 500 words a minute, printing telegraph receivers of various forms, electrical chronoscopes, and many forms of electrical recording apparatus,—amongst others two sets of registering meteorological instruments, of which the earlier, described in 1842, was afterwards developed by F. A. Secchi and F. van Rysselberge, but the later, put forward in 1867, included metallic thermometers and was a success.

Wheatstone's Scientific Papers were collected and published by the Physical Society of London in 1879. Biographical notices of him will be found in his Proc. Inst. C.E., xlvii. 283, and Proc. Roy. Soc., xxix. xvi. For his connection with the growth of telegraphy, see Nature, xi. 510, and xii. 30 sq.

WHEATSTONE'S BRIDGE, an electrical instrument which consists of six conductors, joining four points, of such a character that when an electromotive force is applied in one branch the absence of a current in another branch (called the conjugate branch) establishes a relation between the resistance of the four others by which we can determine the value of the resistance in one of these, that of the others being assumed to be known.

This arrangement was not invented by Sir Charles Wheatstone—although it bears his name and is commonly attributed to him, and was employed by him in some of his electrical researches—but by S. H. Christie, in 1833.

The arrangement of the six conductors is diagrammatically represented in fig. 1. In one of these branches is placed a battery B and in another a galvanometer G; the four other resistances are denoted by the letters P, Q, R, S. The circuits in which the battery and galvanometer are placed are called conjugate circuits, and the circuits P, Q, R, and S are called the arms of the bridge, the branches P and Q being called the ratio arms and S the measuring arm. The circuit in which the galvanometer is placed is the bridge circuit. The keys are inserted in the battery and galvanometer circuits to open or close them at pleasure. The resistance forming the fourth arm of the bridge can be so adjusted that if these resistances have values denoted by P, Q, R, and S, then when $P:Q::R:S$, the current in the galvanometer circuit will be zero when an electromotive force is applied in the battery circuit.

To prove this statement, let the conductors P, Q, R, S, be arranged in a lozenge shape, as in fig. 1. Let $E$ be the electromotive force in the battery circuit, and let $(x+y)$ be the current through the resistance $P$, $y$ the current through the resistance $Q$ and $z$ that through $B$. Then by G. R. Kirchhoff's laws (see ELECTRICKINETS) we have the current equations:

$$
(P+G+R)(x+y)-Gy-Rz=0
(Q+G+S)y-G(x+y)+Sz=0
(R+S+B)z-R(x+y)+Sy=E
$$

Rearranging the terms and solving for $x$ (the current through the galvanometer), we obtain

$$
x=(PS-RQ)/A.
$$

where $A$ is a complex expression, involving the resistances $P$, $Q$, $R$, $S$, and $B$, which does not concern us. Hence when $x=0$, $P:Q::R:S$ and the value of R can be determined in terms of $P$, $Q$, and $S$.

In the practical instrument the three arms of the bridge, $P$, $Q$, and $S$ are generally composed of coils of wire contained in a box, whilst $R$ is the resistance of the value of which is determined. This last resistance is connected to the other three with the addition

1 See Wheatstone's Scientific Papers, p. 129.

of a galvanometer and a battery connected up as shown in the diagram. The operation of determining the value of the resistance $R$ therefore consists in altering the ratio of the three resistances $P$, $Q$, and $S$, until the galvanometer indicates no current through it when the battery circuit is completed or closed by the key. In one form of Wheatstone's Bridge, known as the series pattern plug-resistance bridge, or Post Office pattern, the two ratio arms, $P$ and $Q$, each consist of a series of coils of wire, viz. two 1-ohm coils, two 10-ohm coils, two 100-ohm coils and two 1000-ohm coils, which are joined up in series in the order, 1000, 100, 10, 1, 10, 100, 1000, the junctions between each pair being connected to brass blocks, a series of which are mounted upon an ebonite slab that forms the lid of the box. The blocks are bored out with a hole partly in one block and partly in the other (see fig. 2) so that they can be connected by accurately fitting conical plugs. When the blocks are interconnected by the plugs all the coils are short-circuited; but if the plug or plugs are taken out, then a current flowing from one end of the series to the other is compelled to pass through the corresponding coils. In series with this set of coils is another set, $S$, which forms a measuring arm, the resistances of which are generally 1, 2, 3, 4, 10, 20, 30, 40, 100, 200, 300, 400, 1000, 2000, 3000, 4000 ohms. The junction between each arm of coils is connected as above described to a block, the blocks being interconnected by plugs all of which are made interchangeable.

Another form of Wheatstone's Bridge, shown in fig. 2, is known as the dial pattern. Ten brass blocks are arranged parallel to or around another brass block, and by means of a plug which fits into holes bored partly out of the common block and partly out of the surrounding blocks, any one of the latter can be connected with the common one. A series of nine equal resistances, say 1-ohm coils, or nine 100-ohm coils, are joined in between these circumferential blocks (fig. 3). It will be seen that if a plug is placed so as to connect

FIG. 2.—Standard Wheatstone's Bridge.

any outside block with the central block, the current can only pass from the zero outside block to the central block by passing through a certain number of the resistance coils. Hence according to the magnitude of each coil the total resistance may be made anything from 1 to 9, 10 to 90, or 100 to 900 ohms, &c. Three or four of the "dials" thus bored side by side, the brass blocks being mounted on a slab of ebonite and the coils contained in the box underneath, and they are so joined up that the central block of one dial is connected to the outside block of the next marked Q. This arrangement forms the measuring arm of the bridge, the ratio arms being constructed on the series plug pattern just described. A bridge of this pattern has the advantage that the insertion or removal of a

FIG. 3.—Diagram showing Connections of a Dial and Plug pattern, Wheatstone's Bridge.
WHEEL—WHEEL, BREAKING ON THE

Figs. 4. 5.

measurements the chief difficulty, however, is not to determine the resistance of a coil, but to determine the temperature of the coil at the time when the resistance measurement is made. The difficulty is caused by the fact that the coil is heated by the current used to measure its resistance, which thus alters its value. In accurate measurements, therefore, it is necessary that the coils to be compared should be immersed in melting ice, and that sufficient time should be allowed to elapse between the measurements for the heat generated in the coils to be removed.

The standard resistance coil employed as a means of comparison by which to regulate and check other coils consists of a wire, generally of manganin or platinum silver, insulated with silk and wound on a bobbin, or more usually on a bobbin of brass or a core of copper, and the coil is enclosed in a water-tight brass cylinder so that it can be placed in water, or preferably in paraffin oil, and brought to any required temperature. In the form of standard coil recommended by the British Standards Institution for the measurement of low resistances, the coil is kept stirred by means of a small electric motor during the time of making the measurement. The temperature of the coil can best be ascertained by means of a platinum resistance thermometer.

For the measurement of low resistances a modification of the Wheatstone's bridge devised by Lord Kelvin is employed. The Kelvin bridge consists of nine conductors, and when strictly correct, is known as a Kelvin and Varley slide. Modifications of the ordinary Wheatstone's bridge for very accurate measurements have been devised by H. L. Callender and by Callender and E. H. Griffiths (see G. M. Clark, the Electrician, 38, p. 274). An improved method for measurement of low resistances has been given by R. T. Houseman (The Electrician, 40, p. 300, 1897). These and numerous other modifications of the Wheatstone's bridge will be found described in J. A. Fleming's Handbook for the Electrical Laboratory and Testing Room, vol. i. (1903).

WHEEL. Eng. avel, hæwel, &c., cognate with Icel. hjöl, Dan. høl, &c.; the Indo-European root is seen in Sanskrit chakrâ, Gr. ὕλ, circle, whence "cycle"), a circular frame or solid disk revolving on an axis, of which the function is to transmit or to modify motion. For the mechanical attributes and power of the wheel and for the modification of the lever, known as the "wheel and axis," and of the mechanical powers, see MECHANICS. The most familiar type of the wheel is of course that used in every type of vehicle, but it forms an essential part of nearly every kind of mechanism or machinery. Vehicular wheels in the earliest times were circular disks either cut out of solid pieces of wood, or formed of separate planks of wood fastened together and then cut out in a circular shape. Such may be still seen in use among primitive peoples to-day, especially when the tracks, if any exist, are of the roughest description, and travelling is heavy. The ordinary wheel consists of the nave (O. Eng. nafe, cf. Ger. Nabe, allied with "navel"), the central portion or hub, through which the axle passes, the spokes, the radial bars inserted in the nave and reaching to the peripheral rim, the felloe or felly (O. Eng. felce, Ger. Felge, properly that which fitted together, Teut. felhan, to fit together). From the monuments we see that the ancient Egyptian and Assyrian chariots had usually six spokes; the Greek and Roman wheels from four to eight. (See also GALLEY; and articles on Bicycle; Tricycle; and Motor Vehicles.)

WHEEL, BREAKING ON THE, a form of torture and execution formerly in use, especially in France and Germany. It is said to have been first used in the latter country, where the victim was placed on a cart-wheel and his limbs stretched out along the spokes. The wheel was made to slowly revolve, and the man's bones broken with blows of an iron bar. Sometimes it was mercifully ordered that the executioner should strike the criminal on chest and stomach, blows known as coups de grêle, which at once ended the torture. In France he was usually strangled after the second or third blow. A wheel was not always used...
In some countries it was upon a frame shaped like St Andrew's Cross that the sufferer was stretched. The punishment was abolished in France at the Revolution. It was employed in Germany as late as 1827. A murderer was broken on the row or wheel at Edinburgh in 1604, and two of the assassins of the regent: Lennox thus suffered death.

WHEELER, JOSEPH (1836–1906), American soldier, was born at Augusta, Georgia, in 1836, and entered the United States cavalry from West Point in 1859. Within two years the Civil War broke out, and Wheeler, as a Southerner, resigned to enter the Confederate service. In a short time he became colonel of the 13th Alabama Infantry, to which he was attached part of the victorious operations of 1861 in Kentucky and Tennessee. He commanded a brigade at the battle of Shiloh, but soon afterwards he returned to the cavalry arm in which he won a reputation second only to Stuart's. After the action of Perryville he was promoted brigadier-general, and in January 1863 major-general. Thenceforward throughout the campaigns of Chickamauga, Chattanooga, and Atlanta he commanded the cavalry of the Confederate army in the West, and when Hood embarked upon the Tennessee expedition, he left Wheeler's cavalry to harass Sherman's army during the closing operations of the war, having now the rank of lieutenant-general. Wheeler commanded the cavalry of Joseph Johnston's weak army in North Carolina, and was included in its surrender. After this he became a lawyer and a cotton planter and in 1882–83 and 1885–1900 was a representative in Congress. At the outbreak of the Spanish–American War in 1898, President McKinley, in pursuance of the policy of waging the North and the South, commissioned two ex-Confederate generals—Wheeler and Fitzhugh Lee—as major-generals of United States volunteers, and in this capacity Wheeler was placed in command of the cavalry division of Shafer's army in Cuba. He commanded the divisions in Guisimas and San Juan, was afterwards sent to the Philippines in command of a brigade, and in 1900 was commissioned a brigadier-general in the regular army. Shortly afterwards he retired. General Wheeler died on the 25th of January 1906.

WHEELER, WILLIAM ALMON (1819–1887), vice-president of the United States from 1877 to 1881, was born at Malone, New York, on the 30th of June 1819. He studied at the university of Vermont for two years (1833–35), and in 1845 was admitted to the bar. First as a Whig, and then, after 1856, as a Republican, he was prominent for many years in state and national politics. He was a member of the state Assembly in 1849–50, a member and president pro tempore of the state Senate in 1858–59, and a member of the national House of Representatives in 1861–1863, and again from 1869 until 1877. He was the author of the so-called "Wheeler Compromise," by which the difficulties between contending political factions in Louisiana were adjusted in 1875. Nominated for vice-president by the Republicans in 1876 on the ticket with President Hayes, he was installed in office through the decision of the Electoral Commission, and at the end of his term he retired from public life. He died at Malone on the 4th of June 1887.

WHEELING, a city and the county-seat of Ohio county, West Virginia, U.S.A., on the east bank of the Ohio river, at the mouth of Wheeling Creek, 66 m. (by rail) S.W. of Pittsburgh. Pop. (1890) 34,527; (1900) 38,828, of whom 1066 were negroes, and 5461 were foreign-born, including 3106 Germans and 876 Irish; (1910, census) 41,641. Area, 3·2 sq. m. Wheeling is served by the Baltimore & Ohio, the Pennsylvania and the Wheeling & Lake Erie railways, by the belt line of the Wheeling Terminal Company and by interurban electric lines. Wheeling is the largest city in West Virginia, and commercially the most important place on the Ohio river between Pittsburgh and Cincinnati. It is built on a narrow strip of bottom land, between the river and steep hills, at an elevation of about 640 ft. above tidewater. Between the mainland and Wheeling (formerly Zane's) Island, which forms a part of the city, there are a suspension-bridge, which has a span of 1010 ft., and a steel bridge, and from the island across the back river channel there are two bridges to the Ohio shore, one from the middle of the island to Bridgeport on which the Old National Road crosses the river, and the other from the northern end of the island to Martin's Ferry, Ohio. A fifth bridge connects Wheeling with Bellaire, Ohio. Wheeling has a public library, containing 23,261 volumes in 1909. Near the city is the Mount de Chantal Academy (Roman Catholic) for girls, and in Wheeling is Linsly Institute, a secondary school for boys. The principal public buildings are the Custom-House and Post-Office, the City Hall, a High School, a Y.M.C.A. building and a Scottish Rite Cathedral. In the city are a City Hospital (private, 1890) and the Wheeling Hospital (under the Sisters of St Joseph, 1853). On the National Road there is a small post-office, a rock building north of the town square, which is known as Soldiers' Monument. By reason of its situation on the Ohio river Wheeling is an important shipping and distributing centre, and it has various important manufacturing interests. Its factory products were valued in 1905 at $23,297,475. The chief industry is the manufacture of iron and steel, which in 1905 gave employment to more than 34% of the city's wage-earners, and yielded more than 46% of the total value of its products. The manufacture of nails, begun here in 1849, was for many years of great importance. Other products in 1905 were slaughtering and meat products, $7,812,348; male liquors, $3,543,75; tobacco and cigars ($3,016,85); $963,04; foundry and machine-shop products, $799,375; lumber and planing mill products, $685,861; pickles, preserves and sauces, $376,437; glass, $508,245; and pottery. Glass was first manufactured here in 1821. Coal is found in abundance in the surrounding region, and also natural gas, which is much used as fuel in the manufacture of iron, steel and glass.

The first settlement here was made in 1770 by Colonel Ebenezer Zane (1747–1811), and his brothers, Jonathan (one of the founders of Zanesville, Ohio) and Silas, who, in the autumn of 1777, took with them the finds of $23,297,475. On 1st of September 1777 the town was defended against a large force of Indians by five of the whites were killed; during this attack, when the ammunition of the defenders had failed, Elizabeth Zane (c. 1759–1847), a sister of Ebenezer, brought under fire a keg of powder from a house sixty yards from the fort. In September 1782 the fort was unsuccessfully besieged for two days by a force of about 40 British regular soldiers and about 250 Indians. The town was laid out by Colonel Zane in 1793, was incorporated in 1806, and was chartered as a city in 1836. It was designated as the capital of the "restored government of Virginia" in 1861, after the secession of Virginia at the beginning of the Civil War, and was the capital of West Virginia from 1863 to 1869, and again from 1875 until May 1885. The name "Wheeling" is a corruption of an Indian word, of uncertain meaning, sometimes translated as "the place of the head."

WHETHAMSTEDE, JOHN (d. 1465), English abbott, was a son of Hugh Bostock, and was born at Wheathampstead in Hertfordshire, owing his name, the Latin form of which is FRAGMENTARIS, to this circumstance. In early life he entered St Albans Abbey and in 1410 he was chosen abbot of this house. He attended a council at Pavia, but in England his time was mainly occupied with lawsuits, several of which he carried on to defend the property and ensure the rights of the abbey. In 1440 he resigned his post, but in 1451, on the death of his successor, John Stoke, he became abbott for the second time. He died on the 20th of January 1465, and his tomb may still be seen in the abbey church. Whethamstede was an energetic and successful abbot. He greatly improved the buildings at St Albans, which suffered somewhat during his later years owing to the wars of the roses; he also did some building at Gloucester.
College, Oxford, with which he was connected. He was a friend of Duke Humphrey of Gloucester, whom he helped to gather together his famous collection of books, and was himself a writer, his works including Gramarion de viris illustribus; Palaestrum politarium; and Super Valeriam in Augustinum de Anchenia. Whetstone's Chronicle, or the years of the stay of Johannis Whetstone, is a register compiled soon after the abbot's death, which tells the events of his second abbacy. It has been edited by H. T. Riley, and is in vol. i. of the Regesta quinuaginta abbatum monasterii S. Albani (London, 1872). The two works that his first abbacy are narrated in the Annales monasterii S. Albani of John Amundesham, also edited by H. T. Riley (London, 1870-1871).

WHETSTONE, GEORGE (1544-1587), English dramatist and author, was the third son of Robert Whetstone (d. 1537). A member of a wealthy family that owned the manor of Waleot at Bernack, near Stamford, he appears to have inherited a small patrimony in which he speedily dissipated, and he complains bitterly of the failure of a lawsuit to recover an inheritance of which he had been unjustly deprived. In 1572 he joined an English regiment on active service in the Low Countries, where he met George Gascoigne and Thomas Churchyard. Gascoigne was his guest near Stamford when he died in 1577, and Whetstone commemorated his friend in a long elegy. His first volume, the Roche of Regarde (1576), consisted of tales in prose and verse adapted from the Italian, and in 1578 he published The right excellent and famous History of Promos and Cassandra, a play in two parts, drawn from the eighty-fifth novel of Giraldo Cinthio's Hecatommithia. He was soon addressed to William Fleetwood, recorder of London, with whom he claimed kinship, in which he criticizes the contemporary drama. In 1582 he published his Heptameron of Civill Discourses, a collection of tales which includes The Rare Historie of Promos and Cassandra. From this prose version apparently Shakespeare drew the plot of Measure for Measure, though he was doubtless familiar with the story in its earlier dramatic form. Whetstone accompanied Sir Humphrey Gilbert on his expedition in 1578-1579, and the next year found him in Italy. The Puritan spirit was now abroad in England, and Whetstone followed this current in his prose tract A Mirrour for Magistrates (1584), which in a second edition was called A Touchstone for the Time. Whetstone did not abuse the stage as some Puritan writers did, but he objected to the performance of plays on Sundays. In 1585 he returned to the army in Holland, and he was present at the battle of Zutphen. His other works are a collection of military anecdotes entitled The Honourable Reputation of a Souldier (1585); a political tract, the English Myrro (1586), numerous elegies on distinguished personages, and The Censure of a Loyall Subject (1587). No information about Whetstone is available after the publication of this last book, and it is conjectured that he died shortly afterwards.

WHEWELL, WILLIAM (1794-1866), British philosopher and historian of science, was born on the 24th of May 1794 at Lancaster. His father, a carpenter, wished him to follow his trade, but his success in mathematics at Lancaster and Heversham grammar-schools enabled him to proceed with an exhibition to Trinity, Cambridge (1812). He was second wrangler in 1816, became fellow and tutor of his college, and, in 1814, succeeded Dr Wordsworth as master. He was professor of mineralogy from 1816 to 1822, of physics (1822-1828), to which the publication of this last book, and it is conjectured that he died shortly afterwards. Whewell was prominent not only in scientific research and philosophy, but also in university and college administration. His first work, An Elementary Treatise on Mechanics (1810), co-operated with those of Peacock and Herschel in reforming the Cambridge method of mathematical teaching; to him in large measure was due the recognition of the moral and natural sciences as an integral part of the Cambridge curriculum (1830). In general, however, especially in later years, he opposed reform: he defended the tutorial system, and in a controversy with Thirlwall (1834) opposed the admission of Dissenters; he upheld the clerical fellowship system, the privileged class of "fellow-commoners," and the authority of the heads of colleges in university affairs. He opposed the appointment of the University Commission (1850), and wrote two pamphlets (Remarks) against the reform of the university (1853). He advocated as the true reform, against the scheme of entrusting elections to the members of the Senate, the use of the college funds and the subvention of scientific and professional work.

In 1826 and 1828, Whewell was engaged with Airy in conducting experiments in Dolcoath mine, Cornwall, in order to determine the density of the earth. Their united labours were unsuccessful, and Whewell did little more in the way of experimental science. He was the author, however, of an Essay on Mineralogical Classification, published in 1828, and contributed various memoirs on the tides to the Philosophical Transactions of the Royal Society between 1833 and 1836. But it is on his History and Philosophy of the Sciences that his claim to an enduring reputation mainly rests. The History of the Inductive Sciences, from the Earlist to the Present Time appeared originally in 1837. Whewell's wide, if superficial, acquaintance with various branches of science enabled him to write a comprehensive account of their development, which is still of the greatest value. In his own opinion, the History was to be regarded as an introduction to the Philosophy of the Inductive Sciences (1840). The latter treatise analyses the methods exemplified in the formation of ideas, in the new inductions of science, and in the applications and systematization of these inductions, all exhibited by the History of the Sciences.

In the Philosophy, Whewell endeavours to follow Bacon's plan for discovery of an effectual art of discovery. He examines ideas ("explication of conceptions") and by the "colligation of facts endeavours to unite these ideas to the facts and so construct science. For no art of discovering has been so much anticipated, followed for "invention, sagacity, genius" are needed at each step. He analyses induction into three steps: (1) the selection of the (fundamental) idea, such as space, number, cause or likeness; (2) the formation of a proposition or maxim; (3) the deduction from this of a circle, a uniform force, &c.; and (3) the determination of magnitudes. Upon these follow special methods of induction applicable to questions of fact, the method of means, the method of least squares and the method of residuals, and special methods depending on resemblance (to which the transition is made through the law of continuity), viz. the method of gradation and the method of natural classification.

Here, as in his ethical doctrine (see ETHICS), Whewell was moved by opposition to contemporary English empiricism. Following Kant, he asserted against J. S. Mill the a priori nature of necessary truth. He requires for the construction of conceptions be dispensed with the inductive methods of Mill.

Between 1835 and 1860 Whewell was the author of various works on the philosophy of science. Of these, Elements of the Philosophy of Morality, including Polity, was published in 1845. The character of this work—written, of course, from what is known as the intentional point of view—is its fivefold division of the springs of action and of their objects, of the primary and universal rights of man (personal security, property, contract, family rights and government), and of the cardinal virtues (benevolence, justice, truth, purity and order). Among Whewell's other works—too numerous to mention—reference must be made to writings popular in their day, such as the Bridgewater Treatise on Astronomy (1833), and the essay, Of the Plurality of Worlds (1854), in which he argued against the probability of planetary He, and also to the Platonic Dialogues for English Readers (1850-1861), to the Lectures on the History of Moral Philosophy in England (1852), to the essay, Of a Liberal Education in General, with particular reference to the Leading Studies of the University of Cambridge (1853), to which he added also the translation of Grotius, De jure belli et pacis (1853), and to the edition of the Mathematical Works of Isaac Barrow (1860).

Full bibliographical details are given by Isaac Todhunter, W. Whewell, and Account of his Life (2 vols. 1876). See also Life of W. Whewell, by Mrs Stair Douglas (1881).

WHICHCOTE (or WHITCHCOTE), BENJAMIN (1609-1683), English divine and philosopher, was born at Whitchcote Hall, Stoke, Shropshire, and educated at Emmanuel College, Cambridge, where he became fellow in 1633. He was ordained in 1636, and appointed shortly afterwards to be Sunday afternoon

1 Afterwards broken up into three parts published separately: (1) the History and Philosophy of the Sciences; (2) the History and Philosophy of the Sciences; (3) the History and Philosophy of the Sciences; (4) the History and Philosophy of the Sciences.
WHICKHAM—WHIG AND TORY

588

lecturer at Trinity Church, Cambridge. In 1643 he received the rectory of North Cadbury, Somerset, and in the following year he was appointed provost of King's College, Cambridge, in place of Samuel Collins who was ejected. On resigning North Cadbury in 1646 he became rector of Milton, Cambridgeshire. In 1650 he was vice-chancellor of Cambridge University. Cromwell in 1655 consulted him upon the question of extending toleration to the Jews. His Puritan views lost him the provostship of King's College at the Restoration of 1660, but on complying with the Act of Uniformity he was appointed to the living of St Lawrence's, Blackfriars, London. In 1668 he became vicar of St Lawrence Jewry, London. He is regarded as the founder of the important school of Cambridge Platonists. His works, chiefly theological treatises and sermons, were all published posthumously. He died in May 1683.

See John Tulloch, Rational Theology, ii. 59–84 (1874); and Masters in English Theology, edited by A. Barry (1877).

WHICKHAM, an urban district in the Chester-le-Street parliamentary division of Durham, England, 4 m. S.W. of Newcastle-upon-Tyne, near the river Derwent. Pop. (1901) 12,852. There is a railway station. The town (Sealwell) is the southern branch of the North-eastern railway. The church of St Mary has Norman and Transitional portions, and in the neighbourhood is the mansion of Gibside, of the 17th century. The demesne borders the Derwent, and is of great beauty, part being laid out in formal gardens and straight avenues. It contains a lofty Doric column and a detached chapel and banquetting hall, and in the vicinity are picturesque fragments of the monastic chapel of Friarside, and of the manor house of Hollinside. Whickham is one of the centres of a coal-mining district, the mines employing the majority of the industrial population; but there are also iron, steel, and chemical works.

WHIG AND TORY, the names associated with two opposing political parties in England. The origin of "Whig" has been much controverted; it has been associated with the Scots for "whisky," as implying a taunt against the "sour-milk" faces of the western Lowlanders; another theory is that it represented the initials of the Scots Covenanters' motto, "We hope in God"; another derives it from the Scots word "whiggam," used by peasants in driving their horses. It was, however, a form of the Scots Gaelic term used to describe cattle and horse thieves, and transferred to the adherents of the Presbyterian cause in Scotland. "Tory" is derived from the Irish "Taf a Ri." "Come, oh king!" associated with the creed of the Irish native levies enlisted in the civil wars on behalf of the loyalist cause; the outlaws who fought for James in Ireland after the revolution were similarly nicknamed Rapparees or Tories.

Parliamentary parties, as such, came into existence in England as soon as parliament achieved or aimed at predominance in the state. In 1642, shortly after the meeting of the Long Parliament, they were divided on the question of church reform, passing, as soon as political questions were involved, into Cavaliers and Roundheads. After the expulsion of the Cavaliers in 1642 and 1643 the Houses were divided into a peace party and a war party, and these in 1643 took the shape of Presbyterians and Independents. After the Restoration there was a country party and a court party, and to these the names of Whig and Tory were applied in 1679, in the heat of the struggle which preceded the meeting of the first short parliament of Charles II. The words were nicknames given by the opponents of each party. To call a man a Whig was to compare him with the Presbyterian rebels of the west of Scotland. To call a man a Tory was to compare him with the Papist outlaws of Ireland. In fact, at this time the Whigs were maintainers of parliamentary power over the crown and of toleration for Dissenters, the Tories maintainers of the hereditary indefeasible rights of the wearer of the crown and of the refusal of toleration to Dissenters. The relation between the parties was further qualified by the fact that the heir to the crown was a Roman Catholic, whose claim to succeed was defended by the Tories and assailed by the Whigs.

The persistence of the names of the two parties is mainly owing to their essential unmeaningness. As new questions arose, the names of the old parties were retained, though the objects of contention were no longer the same. The Revolution of 1688–9 made it impossible for the Tories to retain their old attitude of attachment to the hereditary right of the occupant of the throne, with the exception of the extreme wing of the party, which remained Jacobite. They still, however, continued, though accepting the Toleration Act, to oppose the offering of further favours to Dissenters. In Anne's reign, after the war with France had gone on for some time, they supported a peace policy, whilst the Whigs advocated a continuance of the war. At the Revolution of the 17th and the first years of the 18th century the Whigs may be regarded as the party of the great landowners, and of the merchants and tradesmen, the Tories as the party of the smaller landowners and the country clergy. The Whigs established, through their hold upon the boroughs under the influence of the great landowners, a firm government, which could keep in check, and at last practically set aside, the power of the crown. The Tories, disturbing the authority of the ministerial government, and fearing a new despotism based on parliamentary corruption, became, especially after Pitt's time, a party of and for the people, almost democratic in their views and in their demands for the purification of the existing system.

With the accession of George III. Toryism took a new form. The struggle about the Dissenters was now a thing of the past, and the king was accepted as a leader in carrying on the attack against the power of the great Whig families. The attack was the easier because the Whig families had split into factions. For some time the dividing line between Whigs and Tories was this: the Tories asserted that the king had a right to choose his ministers and control their policy, subject to the necessity of securing a majority of the House of Commons, whilst the Whigs thought that the choice should lie with leading members of parliament, and that the king should have no controlling power. The Whig view appears to resemble that subsequently adopted; but in the middle of the 18th century the corruption which prevailed rendered the analogy worthless, and the real conflict was between the corrupt influence of the crown and the influence of a clique of great landowners resting on their possession of electoral power through the rotten boroughs. In 1770 the king had his way and established Lord North at the treasury as his nominee. The Whigs, deprived of power, improved their position by the loss of one great instrument of corruption; but they were weakened by the establishment of two distinct currents of opinion in their own ranks. The main body under Rockingham was influenced by Burke to demand practical reforms, but set its face against any popular changes in the constitution. The Whigs who followed Chatham wished to place parliament on a more popular basis by the reform of the House of Commons. When in 1783 Chatham's son Pitt became prime minister, the Tory party took a new start. It retained the Tory principle of reliance on the crown, and joined to it Chatham's principle of reliance on the people as opposed to the great Whig families. It also supported Pitt in practical reforms.

All this was changed by the French Revolution. In opposition to the new democracy, the Tories coalesced with a section of the Whig families, the representatives of which entered the ministry in 1794. From this time till 1822, in spite of men like Pitt, and the personal influence of Tory leaders who supported moderate reform, Toryism came to be popularly identified with a desire to retain the existing state of things, however full of abuses it might be. When Canning and Peel entered the ministry in 1822, a gradual change took place, and a tendency to practical reform manifested itself. The refusal of Wellington to listen to any proposal for altering the constitution of the House of Commons threw power once more into the hands of the Whigs in 1830. Shortly afterwards the name Tory gave place to that of Conservative (q.v.), though it was cherished by those Conservatives who wished to assert their power of originating a definite policy, and who disliked to be branded with a purely negative appellation, and it was also retained as a term of opprobrium by the Liberals for those whom they regarded as old-fashioned opponents of
reform. The name of Whig was replaced by that of Liberal, being frequently, however, assigned to the less progressive portion of the party, the "moderate Liberals," or even to half-and-half Conservatives, rather than to its extreme members. It ceased to be a name accepted by any definite English political section.

WHIG PARTY, in America, a political party prominent from about 1824 to 1854. The first national party system of the United States came to an end during the second war with Great Britain. The destruction of the Federalist party (q.v.) through a series of suicidal acts which began with the Allen and Sedition laws of 1798, and closed with the Hartford Convention of 1814—1815, left the Jeffersonian Republican (Democratic) party in undisputed control. When, after Waterloo, Napoleon ceased to disturb the relations of the new world with the old, the American people, freed for the first time from all trace of political dependence on Europe, were at liberty to shape their public policy in their own way. During the period of rapid internal development which followed after 1815, the all-inclusive Republican party began gradually to disintegrate and a new party system was evolved, each member of which was the representative of such groups of ideas and interests, class and local, as required the support of a separate party. This work of disintegration and rebuilding proceeded so slowly that for more than a decade after 1824, when its organization began, to maintain the term "Whig" as an appellation of party, was the almost constant contention of the extreme Whigs. The early stages of organization as the personal following of a particular leader or group of leaders, kept on calling itself Republican. Even during the sharply contested election of 1824 the rival partisans were known as Jackson, Crawford and Calhoun, or as Clay and Adams Republicans. (See DEMOCRATIC PARTY.) It was not until late in the administration of John Quincy Adams, 1825 to 1829, that the supporters of the president and Henry Clay, the secretary of state, were first recognized as a distinct party and began to be called by the accurately descriptive term National Republicans. But after the party had become solidly organized during the congressional campaigns of 1826, and later in opposing the measures of President Jackson, it adopted in 1834 the name Whig, which, through memorable associations both British and American, served as a protest against executive encroachments, and thus facilitated union with other parties and factions, such as the Anti-Masonic party (q.v.), that had been alienated by the high-handed measures of President Jackson. The new name announced not the birth but the maturity of the party, and the definite establishment of its principles and general lines of policy. The ends for which the Whigs laboured were: first, to maintain the Union; second, to make the Union a national power, disposed during the national; third, to maintain the republican character of the Union; fourth, while utilizing to the full the inheritance from and through Europe, to develop a distinctly American type of civilization; fifth, to propagate abroad by peaceful means American ideas and institutions. Among the policies or means which the Whigs used in order to realize their principles were the broad construction of those provisions of the Federal Constitution which confer powers on the national government; protective tariffs; comprehensive schemes of internal improvements under the direction and at the cost of the national government; support of the Bank of the United States; resistance to many acts of President Jackson as encroachments by the executive on the legislative branch of the government and therefore hostile to republicanism; coalition with other parties in order to promote national as opposed to partisan ends; resort to compromise in order to allay sectional irritation and compose sectional differences; and cordial and yet prudent expression of sympathy with the liberal movement in other lands.

The activity of the Whig party, resumed from the election of 1832, when the party which ten years before had disintegrated into the new party, disposed during the national; the rise of the new radical democracy under Andrew Jackson, and the growth of sectionalism over the slavery issue, this period was highly critical. In view of these events the most difficult task of the Whigs, clearly discerned and heartily accepted by them, under the patriotic and conservative leadership of Henry Clay and Daniel Webster, was to moderate and enlighten, rather than antagonize, the new democracy; and—what proved to be beyond their powers—to overcome the disrupting influence of the slavery issue.

The inaugural address and the messages to Congress of President J. Q. Adams set forth clearly the nationalizing, broad-construction programme of the new party. But his supporters in Congress, imperfectly organized and facing a powerful opposition, accomplished very little in the way of legislation. The election of 1828 gave to Andrew Jackson the presidency, and to the people, in a higher degree than ever before, the control of the government. The president's attack upon the Bank, the introduction of the modern "spoils system" into the Federal civil service, the unprecedented use of the veto power, Jackson's assumption of powers which his opponents deemed unconstitutional, and his personal hostility towards Clay, who had succeeded Adams in the leadership of the party, brought about, under Whig leadership, a coalition of opposition parties which influenced deeply and permanently the character, policy and fortunes of the Whig party. It became the champion of the Bank of the right of Congress, and of the older and purer form of the civil service system. Moreover, on the eve of his presidency, the group of their new allies, the Whigs learned to practise a tolerance towards and even the principles of their associates which is exceptional in the history of American political parties. In strict accord with their own principles, however, the Whigs supported the president during the Nullification Controversy (see NULLIFICATION). The renown of Webster as the foremost expositor of the national theory of the Union rests largely on his speeches during this controversy, in particular on his celebrated reply to Senator R. Y. Hayne of South Carolina. Nevertheless, after vindicating the Union, the Whigs supported Clay in arranging the compromise tariff of 1833, which compelled the Nullifiers to retreat without acknowledging discomfiture. The majority of the Northern Whigs, with the entire Southern membership of the party, disapproved the propaganda of the Abolitionists on the ground of its tendency to endanger the Union, and many from a like motive voted for the "Gag Rules" of 1835—1844 (see ADAMS, J. Q.), which in spirit, if not in letter, violated the constitutional right of petition. In the election of 1832 Clay was the nominee of the party for the presidency, but in 1836 and 1840, purely on grounds of expediency, the Whig convention nominated for the presidency, first, W. H. Harrison, and then, in the administration of Martin Van Buren the Whigs tried with success to make party capital out of the panic of 1837, which they ascribed to Jackson, and out of the long depression that followed, for which they held Van Buren responsible. The election of General Harrison in the "log cabin and hard cider" campaign of 1840 proved a fruitless victory: the early death of the president and the anti-Whig politics of his successor, John Tyler (q.v.), whom the Whigs had imprudently chosen as vice-president, shattered their legislative programme.

In 1844 Clay was again the Whig candidate, and the annexation of Texas, involving the risk of a war with Mexico, was the leading issue. The Whigs opposed annexation; and the prospect of success seemed bright, until Clay, in the effort to remove Southern misapprehensions, wrote that he "would be glad" at some future time to see Texas annexed if it could be done "without dishonour, without war, with the common consent of the Union, and upon just and fair terms." It is widely held that this letter turned against Clay the anti-slavery element and lost him the presidency. The triumph of Polk in 1844 was followed by the annexation of Texas and by war with Mexico. The Whigs opposed the war, but on patriotic grounds voted supplies for its prosecution. The acquisition of Texas, and the assured prospect of a great territorial enlargement, at the cost of Mexico, brought to the front the question of slavery in the new domain. The agitation that followed continued through the presidential election of 1848 (in which the Whigs elected General Zachary Taylor), and did not subside until the passage of the
“Compromise Measures of 1850” (p.v.). To its authors this compromise seemed essential to the preservation of the Union; but it led directly to the destruction of the Whig party. In the North, where the inhumane Fugitive Slave Law grew daily more odious, the adherence to the Compromise on which Clay and Webster insisted weakened the party fatally. The alternative, namely, a convention of the party to the repeal of the odious law, would have driven the Southern Whigs into the camp of the Democrats, leaving the Northern Whigs a sectional party powerless to resist the disruption of the Union. The only weapons that the Whigs knew how to use in defence of the Fugitive Slave Law were appeals to patriotism and sectional bargaining, and these could be employed only so long as the party remained intact.

The National Whig Convention of 1852, the last that represented the party in its entirety, gave the Northern Whigs the naming of the candidate—General Winfield Scott—who was defeated in the ensuing election, and to the Southern the framing of the platform with its “finality” plank, which, as revised by Webster, read as follows: “That the series of acts of the Thirty-second Congress, the act known as the Fugitive Slave Law included, are received and acquiesced in by the Whig party of the United States as a settlement in principle and substance of the dangerous and exciting questions which they embrace . . . and we will maintain this system as essential to the nationality of the Whig party and the integrity of the Union.”

The advent of the Kansas-Nebraska Act by the Kansas-Nebraska Act demonstrated that “this system” could not be maintained, and that in committing the Whig party to the policy of its maintenance the Convention of 1852 had signed the death-warrant of the party.

Among the services of the Whigs the first in importance are these: During the thirty critical years in which under the leadership of Clay and Webster they maintained the national view of the nature of the Union, the Whigs contributed more than all their rivals to impress this view upon the hearts and minds of the people. During this same extended period the pamphlets-makers between the sections they kept North and South together until the North had become strong enough to uphold by force the integrity of the Union. And lastly they bequeathed to the Republican party the principles on which, and the leader, Abraham Lincoln, through whom the endangered Union was finally saved.

WHIP, in general, an instrument for striking, usually consisting of a handle of a flexible nature with a lash attached (see WHIPPING, below). In English parliamentary usage, a “whip” is a member (or members) chosen by the leaders or masters of a political conference as the special duty of requiring the attendance of the other members of that party on all necessary occasions, the term being abbreviated from the whippers-in of a hunt. The name is also given to the summons urging members of the party to attend. Whips are, of course, always members of parliament, and for the party in power (i.e. the government) their services are very essential, seeing that the fate of an important measure, or even the existence of the government itself, may depend upon the result of a division in the House. Where the majority of the party in power is not large it is very necessary that there should always be at hand a sufficient number of its supporters to make up a majority, and without the attendance of the whips it would be impossible to secure this. The chief whip of the government holds the office of patronage secretary to the treasury, so called because when offices were freely distributed to secure the support of members, it was his chief duty to dispose of the patronage to the best advantage of his party. He is still the channel through which such patronage as is left to the prime minister is dispensed. He is assisted by three junior whips, who are officially appointed as junior lords of the treasury; their salaries are £1000 a year each, while the patronage secretary has a salary of £3000. The parties not in office have whips who are unpaid. Attendance of members is primarily secured by lithographed notices sent by the whips to their following, the urgency or importance of the notice being indicated by the number of lines underscoring the notice, a four-line whip usually signifying the extremest urgency. The whips also arrange for the “pairing” of such of the members of their party who desire to be absent with those members of the opposition party who also desire to be absent. The chief whips of either party arrange in consultation with each other the leading speakers in an expected debate, and also its length, and give the assistance of the whips to the speaker or chairman, who usually falls in with the arrangement. They take no part in debate themselves, but are constantly present in the House during its sittings, keeping a finger, as it were, upon the pulse of the House, and constantly informing their leader as to the state of the House. When any division is regarded as a strictly party one, the whips act as tellers in the division.

An interesting account of the office of whip is given in A. L. Lowell’s Government of England (1908), vol. i. c. xxv.

WHIPPING, or FLOGGING, a method of corporal punishment, which in one form or another has been used in all ages and all lands (see BASTINADO, KNOT, CAT-O’-NINE-TAILS). In ancient Rome a citizen could not be scourged, it being considered an infamous punishment. Slaves were beaten with rods. Similarly in early medieval England the whip could not be used on the freeman, but was reserved for the villain. The Anglo-Saxons whipped prisoners with a three-corded knotted lash. It was not uncommon for mistresses to whip or have their servants whipped to death. William of Malmsbury relates that as a child King Ethelred was flogged with candles by his mother, who had no handier weapon, until he was insensible with pain. During the Saxon period whipping was the ordinary punishment for offences, great or small. Payments for whipping figure largely in municipal and parish accounts from an early date. The aboli- tion of the monasteries, where the poor had been sure of free meals, led during the 16th century to an increase of vagrancy, at which the Statute of Labourers (1560) and its provisions as to whipping had been early aimed. In the reign of Henry VIII was passed (1530) the famous Whipping Act, directing vagrants to be whipped with certain numbers of lashes and to be "tied to the end of a cart naked and beaten with whips throughout such market town till the body shall be bloody." In the 39th year of Elizabeth a new act was passed by which the offender was to be stripped to the waist, not quite naked. It was under this statute that whipping-posts were substituted for the cart. Many of these posts were combined with stocks, as that at Waltham Abbey, which bears date "1558." It is of oak, 3 ft. 9 in. high, with iron clasps for the hands when used for whipping, and for the feet when used as stocks. Fourpence was the old charge for whipping male and female rogues. At quarter-sessions in Devonshire at Easter 1558 it was ordered that the mothers of bastard children should be whipped; the reputed fathers suffering a like punishment. In the west of England in 1681, "certain Scotch peddlars and petty chapmen being in the habit of selling their goods to the great damage and hindrance
of shoppe-keepers," the court ordered them to be stripped naked and whipped. The flogging of women was common. Judge Jeffreys, in so sentencing a female prisoner, is reported to have exclaimed, "Hang me, I charge you to pay particular attention to this lady. Scourge her soundly, man: scourge her till her blood runs down! It is Christmas: a cold time for madness to strip. See that you warm her shoulders." Lunatics, too, were whipped, for in the Constable's Accounts of Great Stoughton, Hunts, occurs the entry, "1690-1, Paid in charges taking up a distracted woman, watching her and whipping her stills, this day—8d." A still more remarkable entry is "1710-1, Pd. Thomas Hawkins for whipping two people yt had smallpox—8d." In 1764 the Public Ledger states that a woman who is described as "an old offender" was taken from the Clerkenwell Bridewell to Enfield and there publicly whipped at the cart's tail by the common hangman for cutting wood in Enfield Chase. A statute of 1701 abolished the whipping of females.

**WHISKER**, a word chiefly used in the plural in the sense of the hair worn by a man on the cheeks as opposed to the beard on the chin and the moustache on the upper lip. This term is also applied to the bristly feelers growing round the mouth of a cat or other animal. The word by derivation means that which "whisks" or "brushes." **WHISKY,** or Whiskey, a potable spirit distilled from cereal grains. The name is probably derived from the Celtic _uisge-beatha_ (water of life), which was subsequently contracted to _usquebaugh_, and still later to whisky (cf. Skeat, _Etym. Dict_. s.v.). The liquor known as "usquebaugh" in the 17th and 18th centuries was not, however, of the same character as the whisky of modern times, but was a compound of plain spirit with saffron, new-mown, sugar and other spices and flavouring matters. Whether the term whisky to denote a plain type of spirit was used concurrently with usquebaugh, or whether the latter name covered both varieties, is not clear. It is certain, however, that an alcoholic liquor, derived mainly from grain, has been prepared for very many centuries in both Ireland and Scotland (see Spirits). There are three main types of whisky, namely, Scotch, Irish and American.

Scotch whiskies may be broadly divided into two main groups, namely (a) pot-still or malt whiskies, and (b) patent-still or grain whiskies; the former are made practically without exception from malted barley only, the latter from a mixture of malted barley and other unmalted cereals, chiefly rye, oats and maize (see Spirits). (a) There are four main varieties of Scotch malt whiskies, namely, Highland Malts, Lowland Malts, Campbeltowns and Islays. The Highland Malts are produced (if we except a few distilleries on the islands in the west and north) in the district on the mainland lying north of an imaginary line drawn through Dundee on the east and Greenock on the west. The largest group of distilleries is in the famous Speyside or Glenlivet district.

The Lowland Malts are made south of the imaginary line alluded to. The Campbeltowns are distilled in or near the town of that name at the southern end of the Kintyre peninsula. The Islays are produced in the island of that name. These different varieties of whisky, although made in much the same way, yet possess distinctive characteristics of flavour. The type of barley employed, the quantity of peat employed in curing the malt, the quality of the water, the manner of carrying out the various distillery processes—particularly that of distillation—the shape and size of the stills, &c., all these are factors which affect the flavour of the final product. The Islays, which, as a rule, are considered to be among the most valuable of Scotch whiskies, possess a very full and peaty flavour together with a strong ethereal bouquet. For this reason they are much used for blending with whiskies of a lighter type. The Highland Malts proper (Speyside type) are less peaty than the Islays, yet possess a full flavour, although many of them are inclined to be "elegant" rather than "big." The Lowland Malts, again, are, as a class, less peated than the Highland Malts, and indeed, probably in view of the growing taste for a more neutral class of beverage, there are some Lowland Malt distilleries which dispense with the use of peat altogether. Many of the Lowland Malts possess considerable body and flavour, but, on the whole, they are lighter and not so fine as those of the Highland variety. Lowland distillers are now running their spirit at much the same strength as the Highland colleagues, whereas formerly it was the custom to work at a far higher strength. The result is that the difference between the two classes of spirit is not so marked as it was. The Campbeltowns, although in some respects similar to the Islays on the one hand, and the Highland Malts on the other, are somewhat rougher and less elegant than these. They usually possess a full peaty flavour. (b) Patent-still or grain whiskies are, as a class, lighter in flavour and "body" than the pot-still types. This is due to the fact that the rectification of these whiskies is carried a good deal further than is the case with the "malt." They are made from a mixture of malted and unmalted cereals, and, as no peat is employed in the curing of the malt, they lack the "smoky" flavour of the other varieties. Some controversy has arisen as to whether these patent-still spirits have a right to the name of "whisky" or "Scotch whisky," but although no doubt, this controversy is largely due to conflicting trade interests, it has also, in the author's opinion, been caused by a very general popular misconception as to the true character of these whiskies. The idea that they are true "silent" or "neutral" spirits—i.e. alcohol and water pure and simple—is quite incorrect. They possess a distinct flavour, which varies at different distilleries, and analysis discloses the fact that they contain very appreciable quantities of the "secondary" products which distinguish potable spirits from plain alcohol. Indeed, as a result of an extensive investigation of the question.

### Composition of Scotch Whiskies

*Note.*—The figures below are based on a large number of analyses of typical samples. Cf. Schidrowitz and Kaye, _Journal Soc. Chem. Ind._ (June 1905). Where two figures are given in the same column, they do not indicate extremes, but merely normal variation.

1 The Islays give similar figures to the Highland Malts except that the Higher Alcohols and Furfural are slightly higher.
by the author, it has been shown that the relative proportion of "secondary" products in Highland Malt, Lowland Malt and "grain" whiskies respectively, is roughly as 3 : 2 : 1. The figures in the foregoing table illustrate, as far as we are at present able to determine them, the general composition of the various types of Scotch whiskies referred to.

The character of Scotch whisky is much influenced by the manner in which it is matured. Chief among the factors in this connexion is the nature of the cask employed. The main varieties are plain wood, sherry and refill casks. Technically the term "plain" wood is applied to a cask made from seasoned oak which has contained no other liquor than whisky. Similarly the term "sherry" wood is as a rule only applied to a cask the wood of which has become impregnated with sherry by contact with that wine, and which has not been used in any other manner. A sherry cask which has been filled with whisky, then emptied and "refilled" with whisky, is known as a "refill." Brandy and Madeira "wood" are also occasionally employed.

The nature of the atmospheric conditions of the cask, is also of importance in determining character and quality (see SPIRITS).

Blending.—Scotch whiskies are, as a general rule, "blended" prior to marketing by the public. By "blending" is understood the art of putting together different types and varieties of whisky to form a harmonious combination. The general run of "self" whiskies—i.e. whiskies from a single distillery—do not appear to be a public taste, but by combining different kinds of whisky blenders have succeeded in producing an article the demand for which has increased enormously during the past quarter of a century, and which may now be regarded as a staple beverage in all English-speaking countries. The great expansion of the Scotch whisky trade of late years is undoubtedly due in the main to the introduction of blending on scientific lines.

There are different types of blenders. In some a Highland Malt, in others an Islay, in others again a "grain" flavour may predominate, but, generally speaking, the aim of the blender is to produce an article in which no single constituent comes through—"i.e. is markedly apparent. The whiskies produced by blending a number of "vatted" whiskies. A "vatt" is produced by blending a number of whiskies of the same style or type, for instance, ten or fifteen Highland Malts from different distilleries. The "vatt" is allowed to mature before being blended with other types to form the final blend. The better-class blends contain, as a general rule, 50 to 60% of Highland and Lowland Malts, 10 to 20% of Islay, and about 20 to 40% of "grain" whisky.

A typical high-class blend would, on analysis, show figures such as follows: Alcohol, 45 to 48% by vol.; total acid, 30 to 50; non-volatile acid, 20 to 30; esters, 30 to 60; higher alcohols, 120 to 170; aldehydes, 15 to 25; furfural, 2 to 5.

Irish Whisky.—Irish pot-still whisky is sharply differentiated from the Scotch variety in that (a) the raw materials employed are generally composed largely of unmalted grain, (b) the malt is not peat-cured, (c) the process of distillation is entirely different both as regards method and apparatus (see SPIRITS). The result is that whereas Scotch whisky possesses a characteristic dry, clean flavour, Irish whisky is round and sweet, with a full ethereal bouquet. The general run of Irish pot-still whiskies are made with 30 to 50% of malted barley, the balance being rye, oats, unmalted barley and wheat. A few distilleries employ malted barley only, but the product so liqueur than whisky. Of the different methods employed and the absence of peat curing—is quite different from Scotch malt whisky. The Irish "grain" or "patent still" whiskies are made in a manner practically identical with that employed for Scotch "grain," but as a class they are somewhat lighter as regards flavour and body than the latter. Irish whiskies are not classified territorially, although occasionally the distinction of "Dublin" or "Country makes" is recognized in the trade. Broadly speaking, however, the differences between Irish whiskies are not due to class, but to individual variation.

American Whisky.—There are two main varieties of American whisky, namely, Rye whisky, the predominant raw material in the manufacture of which is rye, and Bourbon or corn whisky, made mainly from Indian corn (maize). Both varieties possess a much higher flavour and greater body than the Scotch or Irish whiskies, due partly to the class of raw material employed, and partly to the method of distillation. Broadly speaking, the American self (so-called "straight") whiskies contain double the quantity of secondary or "by" products present in Scotch or Irish whiskies.

American whiskies are almost invariably stored in very heavily charred barrels, which, while it very appreciably affects the flavour, is necessary, inasmuch as it is doubtful whether it would be possible to mature these exceedingly heavy whiskies within a commercially reasonable time without the cleansing and purifying effect of the charred wood formed by the burning of the cask. Even with the aid of the charred cask, the average maturation time of the American pot-still whiskies is certainly two or three years longer than that of Scotch and Irish whiskies. (P. S.)

Composition of Irish Whiskies (Analyses by Schidrowitz and Kaye).

1 Irish whisky is generally distilled at about 90 O.P., and reduced with water to 25 O.P. prior to storage. 2 Nos. 1, 2, 3 and 4 represent different distilleries.
WHIST, a game at cards. The etymology of the name is disputed. Possibly it is of imitative origin, from whist (Hast! Hast! Silence!). "It is called Whist from the silence that must be observed in it." (Cotton's Pastime Gamester). In the inimitative a card game called triumphi or trump was commonly played in England. A game called triumphi is mentioned as early as 1526, and triumphi Hispanicus in 1541. La triumphi occurs in the list of games played by Gargantua (Rabelais, first half of 16th century). In Giovanni Florio's World of Words (1598) triumfo is defined as "the play called trump or ruff." It is probable that the game referred to by the writers quoted is la triumphi of the early editions of the Académie des jeux. It is important to note that this game, called by Charles Cotton "French ruff," is similar to écarté. "English ruff and honours," also described by Cotton, is similar to whist. If we admit that ruff and trump are convertible terms, of which there is scarcely a doubt, the game of trump was the precursor of whist. A purely English origin may, therefore, be claimed for trump (not la triumphi). No record is known to exist of the invention of this game, nor of the mode of its growth into ruff-and-honours, and finally into whist. The earliest reference to trump in English is believed to occur in a sermon by Latimer, "On the Card," preached at Cambridge, in Advent, about the year 1520. He says, "The game that we play at shall be the trump. It was played by four players, pair by pair, your trump is your heart, on this card." InGammer Garden's Needle (1575) Dame Chat says, "We be fast set at trump." Eliot (Fruits for the French, 1593) calls trump a "very common alehouse trick." Richard Price or Rice (Insective against Vices, 1579) observes that "renouncing the trompe and comming in againe" (i.e. revoking intentionally) is a common sharper's trick. Cotton in his Compleat Gamester says, "He that can by craft overlook his adversary's game hath a great advantage." Thomas Dekker (Belman of London, 1608) speaks of the decepts practised at "trump and such like games." Trump also occurs in Astley and Cleobadra (written about 1607), with other punning allusions to card-playing— "She, Eros, has Packed cards with Caesar, and false-played my glory Unto an enemy's triumph."—Act iv.

Ruff-and-honours, if not the same game as trump, was probably the same with the addition of a score for the four highest cards of the trump suit. A description of the game is first met with in The Compleat Gamester (1674) by Cotton. He states that ruff-and-honours (alias slam) and whist are games very commonly played between married couples and friends, and that they were "an admirable fit for recreation, and was a reasonable means to encourage the knowledge of the rules." Cotton explains that trump was "a game invented for the purpose of improving the skill of players; and that the score, or trump, was added to the score, or trump, that the player was bid to make, in order to increase the stakes in case of failure."

He says, "The ruff-and-honours... was the game then [1685] in chief vogue." Francis Grose (Classical Dictionary of the Vulgar Tongue, 1785) states that swabbers are "the ace of hearts, knave of clubs, ace and ducie of trumps at whist." The true function of the swabbers is not positively known; it is probable that the holders of these cards were entitled to receive a certain stake from the other players. Swabbers dropped out of general use during the 18th century. The points of the game rose from nine to ten ("nine all," Cotton, 1775; see for mention according to the present standard of play," the popular practice with an alteration, or closely following it, the entire pack of fifty-two cards was used, the deuces being no longer discarded. This improvement introduces the odd trick, an element of great importance in modern whist. Early in the 18th century whist was not a fashionable game. The Hon. Daines Barrington (Archaeologia, vol. viii.) says it was the game of the servants' hall. Contemporary writers refer to it in a disparaging way, as being only fit for hunting men and country squires, and not for fine ladies or people of quality. According to Barrington, whist was frequently played at card parties by the literati, who frequented the Crown Coffee House in Bedford Row, London, about 1728. They laid down the following rules: "Lead from the strong suit; study your partner's hand; and attend to the score." Shortly afterwards the celebrated Edmond Hoyle (q.v.) published his Short Treatise (1742). It has been surmised by some that Hoyle belonged to the Crown Coffee House party. This, however, is only a conjecture. There is abundant evidence to show that, in the middle of the 18th century, whist was regularly played at the coffee houses of London and in fashionable society. From the latter the name of the game was transferred to the country, until the introduction of bridge, which has to a large extent replaced it, but which has much in common with it.

"It will be of interest to mark the successive stages through which whist passed from the time of Cotton. The only suggestions as to the play in Cotton are that, "though you have but mean cards in your own hand, yet you may play them so suitable to those in your adversary's hand, that he may either trump them or play the best of that suit"; and that, "you ought to have a special eye to what cards are play'd out, that you may know by that means either what to play if you lead or how to trump securely and advantageously." It was at this period that the game was introduced, or heard of, as a means of making winning cards, and to watch the fall of the cards with these objects. In the rules laid down by the Crown Coffee House school a distinct advance is to be noticed. Their first rule, "Lead from the strong suit," shows a sound knowledge of the game. Their second rule, "Study your partner's hand," though sound, is rather vague. Their third rule, "Attend to the score," is more valuable. From the Crown Coffee House school to Hoyle is rather a wide jump; but there is no intervening record. Hoyle in his Short Treatise endorses and illustrates the "Crown" rules. He also brought the doctrine of probabilities to bear on the game, as he gave a number of cases which show a remarkable insight into the play.

About 1770 was published William Payne's Maxims for Playing the Game of Whist. The advance in this book is decided, as it presents the rules of leading invariably from five trumps and the return of the highest card from three held originally. Matthew's Advice to the Young Whist-Player (anon, 1804) repeats the "maxims of the old school," with "observations on those he thinks erroneous, and "with several new ones," but some of the maxims which he thinks erroneous are now generally allowed to be correct.

Soon after Matthews wrote the points of the game were cut down from ten (long whist) to five (short whist). Clay's account of this change is that, about the beginning of the 19th century, Lord Peterborough having lost a large sum of money, the players proposed to make the game five up, in order to give the loser a chance of recovering his loss. The new game, short whist, was found to be so lively that it soon became general, and eventually superseded the long game. "Coelebs" (Laws and Practice of Whist, 1811), who quotes Matthews formerly calling it "a game of chance," calls it by its first printed in his second edition (1836) an explanation of the call for trumps. Calling for trumps was first recognized as part of the game by the players at Graham's Club about 1810. Long whist may be said to have died about the same time, "the French" being in the change in the style of play, as recorded by James Clay in The Laws of Short Whist, and a Treatise on the Game (1864).

Whist then travelled, and about 1830 was known and the best French went about, with hats on their heads, modified and improved the old-fashioned system. They were but little influenced by the traditions of long whist, and were not content merely to imitate the English. The French players preferred the "old school," who vehemently condemned its rash trump leads; those who adopted the practice of the new school were found to be winning players.

The late William Pole (Philosophy of Whist, 1858) remarks that the long experience of adepts had led to the introduction of many improvements in detail since the time of Hoyle, but that nothing had been
done to reduce the various rules of the game to a systematic form until 1860, when A. J. Young made a thorough investigation of whist, and in 1862 Henry Jones, one of the members of this "little whist school," brought out a work, under the pseudonym of "Cavendish," which "gave for the first time the rules which have been adopted in all the modern forms of the game." The little school was first brought prominently to notice by an article on whist in the Quarterly Review of January 1862, which had been treated by Jones as the art of the game depended on the practice of a number of arbitrary conventions. But it was now shown that all rules of whist play depend upon and are referable to general principles. Hence, as soon as general principles and the reasons for their adoption were argued, players began to discuss and to propose innovations on the previously established rules of play.

A further development was the introduction of the system of discarded "high" cards protected and led off from the weakest, when the adversaries have the command in trumps. Soon after this (1872) followed the "echo" of the call for trumps, and contemporaneously with the echo the lead of the penultimate card from suits of five cards or more, not including the ace, a lead that was so vigorously opposed by some players that "the grand battle of the penultimate" ensued. The old players indeed regarded the new system with the same horror as they had formerly displayed with respect to the French school, stigmatizing it not only as an innovation, but as a private understanding, and even as cheating! Even Clay, the greatest player of his day, was at first an opponent of the penultimate lead. But the shot at the penultimate (General Day's "Practical Whist," 1879) was the first to propose an analogous system, namely, that six cards in a suit, not including the ace, could be shot by one player and the penultimate then treated as if it was a trump, though it was, did not at first find favour. Before this (1874-1875) leads from high cards, having regard to the number held in the suit, had not escaped attention, several innovations being introduced, but no one of them came into universal adoption at once, and training all leads, and to classify isolated rules so as to render it possible to lay down general principles. This was done in 1883-1884 by Nicholas Browse Treut of New Orleans, who introduced the system of "American leads." American leads propose a systematic course of play when opening and continuing the lead from the strongest suit. First, with regard to a low card led. When you open a strong suit with a low card, the suit is led on the fourth best. When opening a four-card suit with a low card, the lowest, which is the fourth best, is the card selected. When opening a five-card suit with a low card, the penultimate suit is selected. Instead of calling it the penultimate, call it the fourth best. So with a six-card suit; but, instead of antepenultimate, say fourth best. And so on with suits of more than six cards: disregard all the small cards and lead the fourth best. Secondly, with regard to a high card led, followed by a low card, lead your original fourth best. The former rule was to proceed with the lowest. Thus, from ace, knave, nine, eight, seven, two, the leader was expected to open with the ace and then the four. An American leader would lead ace, then eight. Thirdly, with regard to a high card led, followed by a high card. When you remain with two high indifferent cards, lead the higher if you opened a suit with the lower; if you opened a suit with the higher, lead the lower. A player who adopts this system notifies by it to his partner that, when he originally leads a low card, he holds exactly three cards higher than the one led, but if he originally leads a high card, and his partner holds only one, he still holds exactly two cards higher than the second card led; and when he originally leads a high card, and follows it with a high card, he indicates in many cases, to those who know the analysis of leads (as laid down in whist books), whether the strong suit consisted originally of four or of more than four cards. (See Whist Developments, by "Cavendish," 1885.)

These leads led to an overhauling of the play of the second and third hands, which became apparently so complicated as to deter players of moderate ability from plunging into its intricacies. This fact, combined with the introduction of the fascinating and simpler games of bridge, caused a distinct revival in the popularity of whist during the last decade of the 19th century.

Whist (i.e. modern "short" whist) is played with a full pack of 52 cards. The ace is the lowest, except when it is the highest. Thus, from ace, king, queen, &c., in order, down to the two. Four persons play, but with only three or two players the game can still be played with certain modifications (so called "hand whist"). The players draw a card each and the one who gets the lowest deal, and has choice of cards and seats. The player who draws the lowest next is his partner; if two or more players draw cards of equal value, they cut again, the lowest remaining with the original lowest. The cards are then cut and dealt one from one by one from left to right. The last card is turned up to show the trump suit. In America the trump suit is sometimes cut for, the card then being replaced in the pack before shuffling (blind trump). A misdeal passes the deal, and at the end of each hand it passes in any case to the player on the left. At the end of the first trick the dealer takes the turned trump card into his hand. If he fails to do so, the card may be called to any who may have overlooked it, and the next player on his left leads. It is compulsory for the others to follow suit if possible, under penalty for "revoking" (by which the adversaries may either add three to their score, deduct three from the defaulting side, or take three tricks of theirs and add them to their own). A player who cannot follow suit may play any card he chooses to the trick unless he has exposed a card and the adversaries call it. The highest card, or trump (if one is played), wins the trick, the winner leading to the next trick. When all the cards have been played the tricks gained by each side are counted, each trick over six counting one. Six tricks are called a "book," honours—ace, king, queen, knave—also count to the score, but a side which has a score of four at the beginning of a hand cannot score for honours. Tricks count before honours; thus if one side has a score of one and holds four honours, while the other has a score of four and makes the odd trick, the latter wins a double, the honours not counting, as the game has already been won by tricks. The scores for honours are as follows, but some players halve these scores, or, particularly in America, do not count honours at all. This is a matter of arrangement. If one side holds two to four "white," he scores one point if his partner holds none, two points if his partner holds one, three points if his partner holds two, four if his partner holds three, and five if his partner holds four. However, the only score which is deducted is that of an opposing side; hence, when the white side loses three tricks, the score to be deducted is that of the opposing side. If both sides hold two there is no score, honours being divided, or "easy." A rubber consists of the best of three games, unless one side wins the first two games. A game consists of five points. Thus if one side makes nine tricks and holds three honours it scores a game—three points by tricks (or "by cards") and two by honours—but if a revoke has been made, i.e. if a player, holding a card of the suit led, has played a card of another suit, the revoking side cannot score more than four, whatever its score in points may be. The side that wins the rubber scores two points in addition to its score in points, thus three to the victors, one to the defeated. A "treble," a game in which the adversaries have no score; two points for a "double," i.e. when the adversaries have made one or two; one point for a "single," i.e. when they have made three or four. Thus two trebles and the rubber (or "rub") count eight points; treble, single and the rub count six points.

If the losers have won a game, its value is deducted. Sometimes, by arrangement, the rubber points are raised to four. At the end of a rubber, or, by arrangement, of two rubbers, the players cut again for partners. If others wish to join the table the original players cut, the highest gets two points; it is not customary, for more than three to join. The play is continued until the last rubber, the non-vacate at the end of the next rubber, they now take the place of the other original pair, who leave without cutting. When only one player "cuts in," the other three retire by rotation, decided by cutting, and come back in their turn. If more than four players wish to form a table, they cut first to see who shall stand out, the highest retiring; they then cut afresh for partners. 

"Dummy Whist" is played by three players, two being partners and the other playing with dummy, whose cards, which must be dealt face downwards, are exposed on the table before the play begins. Dummy has the first deal in every rubber. His cards being exposed he is not considered able to revoke; if he does, there is no penalty, nor is his partner liable for any mistake of his own whereby he cannot profit, e.g. by exposing a card; but if he leads from the wrong hand, a suit can be called. At Double Dummy each player has a dummy partner, and there is no misdeal, as the deal is a disadvantage.

The leads and the play of the different hands have been so minutely systematized that some of the various tricks, which any one who wishes to become proficient, but some broad general rules may be useful to the beginner. The original leader should lead from his strongest, which is almost always his longest suit, but if his longest suit contains only four cards and is also the trump suit, opinions differ, though most players would observe the general rule. The same rule applies to subsequent first leads of a suit, unless they have to be modified owing to information derived from earlier leads. This is a "trump" suit, the third or fourth trick may have to sacrifice his lead of his strongest suit in response to a "call for trumps" by his partner. Such a lead is
called a "forced" lead, and from three cards the highest should immediately be claimed, but you may claim only the first of the second lead, but from four the lowest should be led. This lead of the highest from three applies to all forced leads, whether they are due to a "call," or to the fall of the cards already played. As a host rule, a partner should always lead if he can have the third heart, but if you have the king also, lead it first; from a five suit without the ace lead the worst but one. With ace and two or three small ones, lead a small one; with ace and one small one, the ace. The second lead, then, is to be judged by the same rules as the first. If the lead be a small one, and he holds the ace, he should play the ace; also holding queen and king, he should play the queen, or with knave, queen and king, the knave. A player who holds the "little trump," or as it is termed in Maxims, generally sound play to put the knave on the ten. With king and one other, or queen and one other, most players advocate the play of the small card; some would play the king under these conditions, but not if the king be led first. The state of the score may affect the play. If it is important to get the lead, so as to lead trumps, the honour should be played, but as a rule the second hand reserves his strength. The third hand should win the trick if he can, as he knows that his partner's card is the winning one; consequently he generally plays his highest card. The fourth hand should win the trick if he can, as a player is justified in passing a trick only if by so doing he is absolutely sure of winning it.

Returned Leads.—A partner's lead should be returned at once, unless one has a strong suit of one's own, in which event it is advisable to lead a card of it, to guide one's partner as to future leads. The general rule is that the first lead of a partner should be returned at once, but if the partner holds three cards originally in his partner's suit he should invariably return the higher of the two left in his hand after that lead. Thus holding ace, three, and king, he should win the ace, and then return the three; if the two falls afterwards, his partner will know that he holds no more. So, with ace, knave, ten only, win the ace and return the knave, though from a scoring point of view it is better to return the ten first; and in this way you will make your ten the highest, unless a card is led. You will return the lowest, but a winning card should always be led or played in the second round, unless there is any special reason for retaining it. If your partner has called for trumps and you get the lead, with four healthy suits, lead the best card you have. If your partner has called for trumps and you get the lead, and there be only three healthy suits, lead the best card if the ten, or else return the second highest. This is universal in trumps (and also applies to forced leads from three-card suits) even if ace, king and another trump be held by both players. If, however, one adversary has obviously played his last trump, a third round is not always advisable, as two trumps will fall from the leader and his partner, and only one from the adversaries. On the other hand it is generally good play to draw two opposing trumps for one, so that they may not make separately.

In the play of a hand never play an unnecessarily high card—unless you are "calling." Thus, holding ten and knave, play the ten; your partner will infer that if you do not hold the nine, king may hold the knave, and even the queen as well, though all the cards are of equal value for making tricks. Similar inferences should be drawn from playing color. A host would not lead the king, as the monarch is always an imitative trump; better play false cards unless you see your partner is so weak that it can do no harm to deceive him; in such a case, with knave and ten, the knave may be played. It is a maxim that information given by play is more valuable than any information obtained in the course of conversation. The only exceptions are Trumping or "Ruffing" and Discarding. The second player should not trump a doubtful card (i.e. a card that his partner might be able to beat), if he is strong in trumps; if weak, he should trump. A winning card from an adversary should be trumped in any case. With weak trumps, it is bad play to "force" one's partner, i.e. invite him to trump; but with strong trumps force him. If your partner refuses to return an adverse lead, you have the only opportunity. If you have a "cross-ruff" (i.e. if you and your partner can trump different suits), those suits should be led alternately, and not trumps. Force an adversary who is known to be strong in trumps. A weak suit in trumps (three only) should be led if the adversaries have a cross-ruff, or if the game is hopeless unless partner is strong, or if winning cards are held in all plain suits, which might be trumps.

General Maxims. Play to the score. If winning the odd trick saves or wins the game, do not try risky combinations for the sake of getting two or three tricks. Count your cards before playing. If your partner "doubles," that is, if he asks if he has a card of the suit led, to save the revoke, announce the score when you mark it. Watch the fall of every card. Study the rules, especially those about penalties and consultation with a partner. If the partner is a clever player, do not give away the game, and you hold the winning card, play it, unless it be the winning trump, which is good at any time. Retain the trump-card if you can play others of equal trick-making value; your partner will lead one of the trump suit, in which event you must play a lower card than your highest in the third hand) in partner's suit, unless he leads a high card in an obviously forced lead. Lead through a known strong suit on your left, and (especially) up to a trump if you are sure of the suit on your partner left. Do not fine score a trick unless two lead the highest. Leading from a "singleton" (your only card in one suit), in order to be able to trump—sometimes disparagingly called 'Whitechapping' is not generally good play, and results badly unless the side is strong in trumps, but in some circumstances it is useful. Do not lead from a "tenace" (i.e. best and third best of a suit) if you have another equally good suit. Remember that what is a game of combination, and that tricks made by your partner are just as valuable to you as tricks made by yourself. Sort your hand so as to keep the suits separate, red and black alternately, keeping the cards each in order of their value.

Progressive Whist.—This form of the game is social rather than scientific, but is a pleasant variety on the ordinary round game. The laws provide, as a rule—first, second, and "booby" values for kings, and also values for the honours, not for the players, but for the players, and for each player the honours are the two that make the fewest points. Any number of tables may be formed. Partners are selected by lot, two ladies and two gentlemen being the usual form of table. This can be done by means of sets of tickets of different colours, numbered identically. No. 1 pairing with No. 1 and so on. After the first round there is no drawing for partners, as will be seen. The holders of all tickets are given a copy of each table, and the first number that is drawn is led. Only one pack of cards is needed at each table, but every player should be provided with a scoring card and pencil. The players at all the tables cut for deal, but no dealing is begun before a signal has come from the master of the table. The highest marked trump is led. Honours are not counted. The score is marked by the number of tricks made, or the winner may mark all tricks above six. The game is divided into two rounds, and the tables from No. 1 to No. 2, from No. 2 to No. 3 and from the last table to No. 1. Partners are formed afresh, the gentleman who has just won playing with the lady who has just lost, and vice versa. Play may last for one or more complete tables, or up to a given number of tricks in a table, indicated by a signal, after which no fresh hand is begun. The scores are then added up and the prizes awarded. In playing the ordinary rules of whist are observed.

A printed existence was first given to the laws of whist by Hoyle in 1743. The fourteen laws then issued were subsequently increased to twenty-four. These laws were the authority until 1760, when the members of White's and Sanders's Chocolate Houses revived them. The revised laws (nearly all Hoyle) were accepted by whist players for over a century, notwithstanding that they were very incomplete. The laws of short whist, a more comprehensive code of the game, was first put forth by the Portland Whist Club in 1846, and became the accepted standard, small modifications only having been introduced since. The latest edition of the rules should be consulted for what is not indicated in the text.

See Principles of Whist, Slated and Explained, by "Cavendish" (London, 1902), the most authoritative work.

WHISTLE, the shrill warbling sound made by forcing the breath through the lips, contracted to form a small orifice, or produced by means of an instrument of the whistle type; also generally, any similar shrill, hissing or warbling sound, as of a bird's note, of wind through trees, ropes, &c. The O. Eng. huskian, whistle, and huskle, whistler, piper, are closely allied to huskrian or huskstrian, to whistle, to speak softly or under one's breath; and boards are imitate warbling notes, gor, shrill sound, cf. Ger. wisteln, to whisper. Dan. kistle, to whistle. The instrument known as a "whistle" takes many forms, from...
WHISTLER

the straight flute and flageolet type made of wood or metal and pierced with holes, to the metal signalling pipe used for signalling on board ship or by policemen. Similarly the term is used of the instruments sounded by the escape of steam on a locomotive or other engine and on steamships, &c., as a means of giving signals.

WHISTLER, JAMES ABBOTT MCNEILL (1834–1903), American artist, was born at Lowell, Massachusetts, on the 10th of July 1834. His father was Major C. W. Whistler, and his mother one of the Baltimore family of Winans. He was first born of in Europe in 1832, when he had already been an art student, in Paris, in the studio of Gleyre. His first etchings, those known as “The French Set,” were the means of bringing him under the notice of certain people interested in art, but the circulation of these first, like that of his later etchings, has always, of necessity, been more limited than their fame. The impressions from each plate are generally few. It was still in etching that Whistler continued his labours, and, coming to London in 1859, it appears, he almost at once addressed himself to the chronicle of the quaint riverside buildings and the craft of the great stream—the Thames “below Bridge.” The “French Set” had included De Hooch-like or Nicholas Maes-like genre pieces, such as “La Vieille aux loques,” the “Marchande de moutarde,” and “The Kitchen,” this last incomparably improved and perfected by the retouching that was accomplished a quarter of a century after the first performance. The Thames series of sixteen etchings, wrought chiefly in 1859, disclosed a new vision of the river, in which there was expressed, with perfect draughtsmanship, with a hitherto unparalleled command of vivacious line, the form of barge and clipper, of warehouse, wharf and waterside tavern. “The Pool,” “Thames Police” and “Black Lion Wharf” are perhaps the finest of this series. Before it was begun, Whistler, ere he left Paris, had proceeded far with a plate, existing only in the state of trial proof, and, in that, of extreme rarity. It is called “Paris, Ile de la Cité,” and has distinct and curious manifestations of a style to be more generally adopted at a later period. For several years after the completion of the “Sixteen Etchings,” Whistler etched comparatively little; but about 1875 we find him entering what has been described as his “Leyland period,” on account of his connexion with the wealthy shipowner and art patron, Mr Frederick R. Leyland, of Prince’s Gate, whose house became famous for Whistler’s Peacock Room, painted in 1877. In that period he worked greatly in dry-point. The “Model Resting,” one of the most graceful of his figure pieces, and “Fanny Leyland”—an exquisite instance of girl portraiture—are notable performances of this time. To it also belong the largely conceived dry-points, so economical of means and endowed with so singular a unity of effect, the “London Bridge” and “Price’s Candle-works.” A little later came the spirited and archly sensuous “the Wharf at Battersea and Putney, and the plate “The Adam and Eve,” which records the river-front of old Chelsea. This, however, is only seen in perfection in the most rare proofs taken before the publication by the firm of Hogarth. From these plates we pass almost imperceptibly to the period of the Venetian etchings, for in 1879, at the instance of the Fine Art Society, Whistler made a sojourn in Venice, and here he wrought, or, to speak accurately, commenced, not only the set of prints known as the “Venice Set,” but also the “Twenty-six Etchings,” likewise chiefly, though not wholly, of Venice—issued later by the firm of Dowlceswell. One or two of the minor English subjects of the “Twenty-six Etchings”—those done after the artist’s return from Venice—give indications of the phase reached more clearly in certain little prints executed a few years later, and, with perhaps one exception, never formally published. “Fruit Shop,” “Old Clothes Shop,” and “Fish Shop, busy Chelsea,” belong to this time. Later, and bent upon doing justice to quite different themes, which demand different methods, the ever flexible artist again changes his way, and—not to speak of his dainty little records of the places about the Lute, which in method have affinity with the pieces last named—have

1 Whistler quarrelled with Leyland, and eventually painted his life-size portrait as a devil with horns and hoofs.

“Steps, Amsterdam,” “Nocturne, Dance House,” with its magical suggestion of movement and light, and the admirable landscape “Zaandam.” With the mention of these things may fitly close a sketch of Whistler’s periods in etching; but before proceeding to other branches of his work, the main characteristics of the whole series of etchings (of which, in Wedmore’s Whistler’s Etchings, nearly 300 examples are described) should be briefly indicated. These main characteristics are precision and vivacity; freedom, flexibility, infinite technical resource, at the service of the most alert and comprehensive observation of an eye that no picturesqueness of light and shade, no interesting grouping of line, can ever escape—an eye, that is, that is emancipated from conventionality, and sees these things therefore with equal willingness in a cathedral and a mass of scaffolding, in a Chelsea shop and in a suave nude figure, in the façade of a Flemish palace and in a “great wheel” at West Kensington.

Mr. Whistler’s pictures have as a chief source of their attractiveness those mental qualities of alertness and emancipation. Charm of colour and of handling enhance the hold which they obtain upon such people of taste as may be ready to receive them. There are but very few of them, however, at least very few oil pictures, when one considers the number of years since the artist began to labour; and one notable fact must be at once understood—the admitted masterpieces in painting belong almost entirely to the earlier time. “Sarasate” is an exception, and “Lady Archibald Campbell,” and in its smaller, but still charming, way “The Little Rose of Lyme Regis”; but even these—save the “Little Rose” —are of 1859 or thereabouts. A few years earlier than they are the “Committee,” the “Miss Alexander,” and the “Rosa Corder,” and the Thames “Nocturnes”; but we go farther back to reach the “Portrait of the Painter’s Mother,” which is now in the Luxembourg; the “Portrait of Carlyle,” now at Glasgow; the “Cremorne Gardens,” the “Nocturne, Valparaiso Harbour,” the “Music Room,” with little Miss Annie Haden standing by the piano while her mother plays, and the “White Girl,” or “Little White Girl,” in which Whistler shows the influence, but never the domination, of the Japanese. Of the slight but always exquisitely harmonious studies in water colour, undertaken by Whistler in his middle period, none call for special notice. To the middle time, too, belong, not perhaps all of his slight but delicately modelled pastels of the figure, but at least his more universally accepted pastels of Venetian scenes, in which he caught the sleepy beauty of the Venetian by-way. In pastel, as in painting, in water colour and in etching, Whistler has never been unmindful of the particular qualities of the medium in which he has worked, nor of the applicability of a given medium to a given subject. The result, accordingly, is not now a victory and now a defeat, as in the early work, but a triumph where the artist has come to terms with the resource of triumphs great and small. One other medium taken up by Whistler must now be mentioned. His lithographs—his drawings on the stone in many instances, and in others his drawings on that “lithographic paper” which with some people is the easy substitute for the stone to-day—are perhaps half as numerous as his etchings. Mr T. R. Way has catalogued about a hundred.

Some of the lithographs are of figures slightly draped; two or three of the very finest are of Thames subjects—including a “nocturne” at Limehouse, of unimaginable and poetic mystery; others are bright and dainty indications of quaint prettiness in the old Faubourg St Germain, and of the sober lines of certain Georgian churches in Soho and Bloomsbury. An initiator in his own generation, and ever tastefully experimental, Whistler no doubt has found enjoyment in the variety of the mediums he has worked in, and in the variety of subjects he has brilliantly tackled. The absence of concentration in the Whistlerian temperament, the lack of great continuity of effort, may probably prove a drawback to his taking exactly the place as a painter of oil pictures, which, in other circumstances, his genius and his taste would most certainly have secured for him. In the future Whistler must be accounted, in oil painting, a master exquisite but rare. But the number and the range of his etched subjects and the extraordinary variety of perception and of skill which
WHISTON—WHITBREAD

He has brought to bear upon the execution of his nearly three hundred coppers, ensure, and have indeed already compassed, the acceptance of him as a master among masters in that art of etching. Rembrandt’s, Van Dyck’s, Meryon’s, Claude’s, are, in fact, the only names which there is full warranty for pronouncing beside his own.

No account of Whistler’s career would be complete without a reference to his extremely controversial personality. In 1878 he brought a libel action against Ruskin for his criticisms in *Fors Clavigera* (1877). Ruskin had denounced one of his nocturnes at the Grosvenor Gallery as “a pot of paint flung in the public face.” After a long trial, Whistler was awarded a farthing damages. His examination caused much interest, especially in artistic circles, on account of his attitude in vindication of the purely artistic side of art; and it was in the course of it that he answered the question as to how long a certain “impression” had taken him to execute by saying, “All my life.” His eccentricity of pose and dress, combined with his artistic arrogance, sharp tongue, and bitter humour, made him an object of derision and talked-about men in London, and his mots were quoted everywhere. He followed up his quarrel with Ruskin by publishing a satirical pamphlet, *Whistler v. Ruskin: Art v. Art Critics*. In 1885 he gave his Ten o’Clock Lecture in London, afterwards embodied in *The Gentle Art of Making Enemies* (1890). The substance of this flippantly written and amusing outburst was an insistence on the liberty of the artist to do what was right in his artistic eyes, and the inability of the public or the critics to have any ideas about art worth considering at all. In 1895 appeared a pamphlet entitled, *Whistler et de son cas: l’affaire de portrait*. Whistler had painted, but refused to hand over, came into the courts in Paris; and Whistler, though allowed to keep his picture, was condemned in damages. In later years he lived mainly in Paris, but he returned to live in London in 1902; and he died on the 17th of July 1903 at 74 Cheyne Walk, Chelsea. In 1888 he married Mrs Goodwin, widow of E. W. Goodwin, the architect, and daughter of J. B. Philip, the sculptor; she died in 1896, leaving no children. In 1886 he became president of the Royal Society of British Artists (a title at which afterwards he scoffed); and he took a leading part later in founding the International Art Society, of which he was the first president. His “Nocturne in blue and silver” was presented to the National Gallery after his death by the National Art Collection Fund.

WHISTON, WILLIAM (1667–1752), English divine and mathematician, was born on the 9th of December 1667 at Norton in Leicestershire, of which village his father was rector. He was educated privately, partly on account of the delicacy of his health, and partly that he might act as amanuensis to his father, who had lost his sight. He afterwards entered at Clare College, Cambridge, where he applied himself to mathematical study, and obtained a fellowship in 1693. He became chaplain to John Moore (1656–1714), the learned bishop of Norwich, from whom he received the living of Lowestoft in 1668. He had already given several proofs of his noble but overscrupulous character, and at the expense of his pen to the expense of paradox. His *New Theory of the Earth* (1669), although destitute of sound scientific foundation, obtained the praise of both Newton and Locke, the latter of whom justly clasped the author among those who, if not adding much to our knowledge, “at least bring some new things to our thoughts.” In 1701 he resigned his living to become deputy at Cambridge to Sir Isaac Newton, whom two years later he succeeded as Lucasian professor of mathematics. In 1707 he was Boyle lecturer. For several years Whiston continued to write and preach both on mathematical and theological subjects with considerable success; but his study of the *Apostolical Constitutions* had convinced him that Arianism was the creed of the primitive church; and with him to form an opinion and to publish it were things almost simultaneously. His heterodoxy soon became notorious, and in 1710 he was deprived of his professorship and expelled from the university. The rest of his life was spent in incessant controversy—thological, mathematical, chronological and miscellaneous. He vindicated his estimate of Galileo’s *Dialogue Concerning the Two Chief World Systems* (1632), and defended it against the charges derived from them in *His Primitive Christianity Revised* (3 vols., 1711–1712). In 1713 he produced a reformed liturgy, and soon afterwards founded a society for promoting primitive Christianity, lecturing in support of his theories at London, Bath and Tunbridge Wells. One of the most valuable of his books, the *Life of Samuel Clarke*, appeared in 1730. While heretical on so many points, he was a firm believer in supernatural Christianity, and frequently took the field in defence of prophecy and miracle, including anointing the sick and touching for the king’s evil. His dislike of nation was in proportion to his desire to discover the longitude. Of all his singular opinions the best known is his advocacy of clerical monogamy, immortalized in the *Vicer of Wakefield*. Of all his labours the most useful is his translation of *Josephus* (1737), with valuable notes and dissertations, often reprinted. His last “famous discovery, or rather revival of Dr Giles Fletcher’s,” which he mentions in his autobiography with infinite complacency, was the identification of the Tatars with the lost tribes of Israel. In 1745 he published his *Primitive New Testament*. About the same time (1747) he finally left the Anglican communion for the Baptist, leaving the church literally as numerically as figuratively by quitting it as the clergyman began to read the Athenian creed. He died in London, at the house of his son-in-law, on the 22nd of August 1752, leaving a memoir (3 vols., 1749–1750) which deserves more attention than it has received, both for its characteristic individuality and as a storehouse of curious anecdotes and illustrations of the religious and moral tendencies of the age. It does not, however, contain any account of the proceedings taken against him at Cambridge, these having been published separately at the time.

Whiston is a striking example of the association of an entirely paradoxical bent of mind with proficiency in the exact sciences. He also illustrates the possibility of arriving at rationalistic conclusions in theology without the slightest tincture of the rationalistic temper. He was not only paradoxical to the verge of craziness, but intolerant to the verge of bigotry. “I had a mind,” he says, “to hear Dr (John) Gill preach. But, being informed that he had written a folio book on the Canticles, I declined to go to hear him.” Whiston was not engaged in controversy he was not devoid of good sense. He often saw men and things very clearly, and some of his bon mots are admirable.

WHITAKER, JOSEPH (1820–1893), English publisher, was born in London on the 4th of May 1820, and apprenticed to a bookseller at the age of fourteen. After leaving school he worked in book-keeping firms, he began business on his own account as a theological publisher. In January 1858 he started the *Bookseller*, and for 1860 published the first issue of *Whitaker’s Almanack*, the annual work of reference, which also met with immediate success. In 1874 he published the first edition of the *Reference Catalogue of Current Literature*, of which several editions have since appeared. Whitaker died at Enfield on the 15th of May 1893. He had been the father of fifteen children.

WHITBREAD, SAMUEL (1759–1815), English politician, came of a Berkshire Nonconformist family; his father had made a considerable fortune as owner of the well-known brewery associated with his name. Educated at Eton and St John’s College,
Cambridge (after originally going to Christ Church, Oxford), he began by entering the brewing business; but after his marriage with the daughter of the 1st Earl Grey in 1789 he took to politics, and in 1790 was elected for Bedfordshire as a Whig, attaching himself to Fox. He became known as a social and financial reformer and a constant assailant in parliament of all sorts of abuses. It was on his motion in 1803 that Lord Melville was impeached for financial maladministration of the navy, and he conducted the case for the prosecution. His Poor Law bill in 1807, an elaborate Radical scheme, came to nothing. Whitbread continued to be a constant speaker in parliament, and the principal representative of Liberal criticism, a monument of opposition tactics. He opposed the regency, championed the princess of Wales, and led the peace party; and the caricaturists were busy with his personality. In 1809 he became chairman of the committee for rebuilding Drury Lane theatre, and for some time he was immersed in controversies connected with it, which eventually seem to have unstrung his mind, for he committed suicide on the 6th of July 1815. The Whitbread influence in Life of politics continued to be very striking in Whitchurch in later generations, his son William Henry (from 1818 to 1837) and grandson Samuel (from 1852 to 1895) representing Bedford for many years.

**Whitby**, a seaport, watering-place and market town in the Whitby parliamentary division of the North Riding of Yorkshire, England, 245 m. N. from London, on the North-Eastern railway. Pop. of urban district (1901) 17,755. There are a terminal station in the town and a station at West Cliff on the Saltburn branch. Whitby is beautifully situated at the mouth and on both sides of the Esk; the old town is built on the heights of picturesque houses standing on the steep slopes above the river, while the modern residential quarter is mainly on the summit of West Cliff. A long flight of steps leads up the eastern height to the abbey, the ruins of which gain a wonderful dignity from their commanding position. This was a foundation of Osy, king of Northumbria, in 658, in fulfillment of a vow for a victory over Penda, king of Mercia. It embraced an establishment for monks and (until the Conquest) for nuns of the Benedictine order, and under Hilda, a grand-niece of Edwin, a former king of Northumbria, acquired high celebrity. The existing ruins comprise parts of the Early English choir, the north transept, also Early English but of later date, and the rich Decorated nave. The west side of the nave fell in 1765 and the tower in 1830. On the south side are foundations of cloisters and domestic buildings. Adjoining the abbey is Whitby Hall, built by Sir Francis Cholmley about 1580 from the materials of the monastic buildings, and enlarged and fortified by Sir Hugh Cholmley about 1635. A little below the abbey is the parish church of St Mary, originally Norman, and retaining traces of the first building; owing to a variety of alterations at different periods, and the erection of high wooden pews and galleries, its appearance is more remarkable than beautiful. A modern cross in the churchyard commemorates St Caedmon, the Northumbrian poet (c. 670), who was a monk at the abbey and there died. Other features of the town are the pleasant promenades and gardens on West Cliff, the anti- quarian and geological museum, and an excellent golf course. The coast is cliff-bound and very beautiful both to the north and to the south, while inland the Esk traverses a lovely wooded vale, surrounded by open, high-lying moors. Whitby is a quiet resort, possessing none of the brilliance of Scarborough on the same coast. A large fishing industry is carried on from the harbour, which is formed by the mouth of the river and protected by two piers. The manufacture of ornaments from the jet found in the vicinity forms a considerable industry. The jet is a species of petrified wood found towards the bottom of the Upper Lias, and its use for the purpose of ornament dates from very early times. A former activity in shipbuilding is of interest through the recollection that here were constructed the ships for Captain Cook's voyages. Wooden ships and boats are still built, and rope-making and sail-making are carried on.

Whitby (Stromnesshoek c. 657-587; Presteke c. 857-1087); Whitby, & c. 857 onwards) is first mentioned by Bede, who states that a religious house was established here about A.D. 657. In the 9th century it was destroyed by the Danes, but being refounded became the centre of a Danish colony, and until late waste by the Conqueror was the most prosperous town in the district. Henry I. made a grant to the abbey and convent of Whitby of a burgage in the villa of Whitby, and Richard de Waterville, abbot 1175-1190, granted the town in free burgage to the burgesses. In 1200 King John, bribed by the burgesses, confirmed this charter, but in 1201, bribed by the successor of Richard de Waterville, quashed it as injurious to the dignity of the church of Whitby. A bitter struggle went on, however, till the 14th century, when a trial resulted in a judgment against the burgesses. In 1659 Whitby petitioned for incorporation on the ground that the town was in decay through want of good government and received letters patent giving them self-government. However, in 1674-1675 the crown, probably in gratitude for the part played by the Cholmeleys in the Civil War, restored to the lords of the manor all the liberties ever enjoyed by the abbots of Whitby in Whitby and Whitby Strand. Whitby became a parliamentary borough under the Reform Act of 1832, returning one member until it was disfranchised under the Redistribution of Seats Act 1885. At the beginning of the 14th century Sir Alexander Percy claimed the hereditary right of buying and selling in Whitby without payment of toll. The market was held time out of mind on Sunday until the reign of Henry VI., who changed the day to Saturday, still the market day. A fortnightly cattle market was granted by Charles I. Henry I. granted to the abbot of Whitby a fair at the feast of St Hilda and the king's firm peace to all coming to the fair. A second fair was granted by Henry VI. The fair is a great attraction, and the number of dealers is any longer held. There was a port at Whitby in the 13th century and probably before, and though never important there have always since been traces of Whitby shipping and merchandise. In medieval times the salting and sale of herrings and the sale of cod, fish and other products of the North Sea fishery were the only industries. Whale-fishing began in 1753.

See J. C. Atkinson, Memorials of Old Whitby (London, 1894); Lionel Charlton, History of Whitby (York, 1779); George Young, History of Whitby (Whitby, 1817); Victoria County History, Yorkshire, North Riding.

**Whitchurch**, a market town in the Newport parliamentary division of Shropshire, England, 171 m. N.W. from London on a joint line of the London & North-Western and Great Western railways, and the terminus of the Cambrian railway. Pop. of urban district (1901) 5227. Malting and cheese-making are the principal industries. The church of St Alkmund, rebuilt in the 18th century, retains the fine tomb of John Talbot, first earl of Shrewsbury, who fell at the battle of Bordeaux (1453). The town hall and other public buildings are modern. The grammar school was founded in 1590, and here (c. 1591) Reginald Heber, Bishop of Calcutta, was educated. The parish of Whitchurch extends into Cheshire.

Whitchurch was at first known as Westun and belonged before the Conquest to King Harold, but was afterwards granted to Earl Roger, of whom William de Warenne was holding it at the time of the Domesday Survey. The name is said to have been altered to Whitchurch or Album Monasterium on account of a stone church built there soon after 1086. The manor appears to have been held by a younger branch of the Warenne family, from whom it passed by marriage to the families of Lestrange and Talbot. It was sold by the Talbots to Thomas Egerton, from whom it passed to the earls of Bridgewater and eventually to the present owner, Earl Brownlow. Whitchurch is mentioned as a borough in the 14th century, and was governed by a bailiff, but its privileges, which sprang up with the castle, appear to have disappeared after its decay. The town has never been represented in parliament nor noted for any trade except agriculture. In 1228 John Fitz-Alan received the right of changing the day of the market he held at Whitchurch from Thursday to Monday, and in 1562 a fair lasting three days from the feast of SS. Simon and Jude was granted to John Lestrange. Lord Brownlow granted the market rights to the local authority.
WHITE, ANDREW DICKSON (1832- ), American educationalist, was born in Homer, New York, on the 7th of November 1832. He graduated at Yale (A.B.) in 1853, studied at the Sorbonne in 1854, and at the University of Berlin in 1855-1856, meanwhile serving as attaché at the United States Legation at St Petersburg in 1854-1855. He was professor of history and English literature in 1857-1863, and lecturer on history in 1863-1867 at the University of Michigan. In 1864-1867 he was a member of the New York state Senate, and as chairman of the Committee on Education took an active part in formulating the educational features of the bill under which Cornell University (q.v.) was incorporated (1865). At Mr Cornell's suggestion Mr White drew up a plan of organization for the institution, and in 1867 became its first president, which post he held continuously until 1885, when therefrom he was a member of the board of trustees and of its executive committee. During his administration he greatly strengthened the curriculum of the university, to which he gave his architectural library, and, upon his retirement, his historical and general library of about 20,000 volumes (including bound collections of pamphlets) and about 3000 unbound pamphlets, which was installed in a special room in the main library building of the university.

In recognition of this gift the departments of history and political science of the university have been named the President White School of History and Political Science. In 1870 President Grant appointed Benjamín F. Durley (2 vols., New York, 1905) as most of the personal correspondence, and visited Santo Domingo and reported on the advisability of the president's project for annexing it to the United States, and in 1885 he was appointed by President Cleveland a member of the commission established to determine the boundary between Venezuela and British Guiana. Dr White was United States minister to Germany in 1879-1881, and to Russia in 1882-1894, and was United States ambassador to Germany in 1897-1903. In 1889 he was president of the American delegation at the Hague Peace Conference. He received the degree of D.L. from the University of Michigan (1867), from Cornell (1880), from St Andrews, Scotland (1902), from Johns Hopkins (1902), and from Dartmouth (1896); L.H.D. from Columbia (1879) and D.C.L. from Oxford (1902). He was also made an officer of the Legion of Honour, was awarded the royal gold medal of Prussia for arts and sciences in 1902, was president of the American Historical Association, of which he was a founder, in 1884, and was actively identified with various other learned bodies.

His publications include The Greater States of Continental Europe (1874); A History of the Warfare of Science with Theology (2 vols, 1875); his Autobiography (2 vols., New York, 1905) and Seven Great Statesmen (1910).

WHITE, SIR GEORGE STUART (1835- ), British field marshal, the son of an Irish country gentleman, was born in County Antrim on the 6th of July 1835. He was educated at Sandhurst, and in 1853 joined the Inniskillings, with which regiment he served in India during the Mutiny in 1857. In the second Afghan War (1878-80) he was second in command of the Gordon Highlanders, whom he led in their charge at the battle of Charsaddah. For conspicuous gallantry in this action, and again in the Eastern campaign at Kandahar, he received the Victoria Cross. In 1881 he assumed command of the Gordon Highlanders, and took part in the Nile Expedition of 1884-85. As brigadier in the Burmese War (1885-87) he rendered distinguished service, for which he was promoted major-general; and when Sir Frederick (afterwards Lord) Roberts returned to India from Burma in 1887, White was left in command of the force charged with the duty of suppressing the dacoits and pacifying the country. This he accomplished with a thoroughness which earned the thanks of the government of India. He was in command of the 3rd Brigade in the Boer War, and in 1893 he succeeded Lord Roberts as commander-in-chief in India; and during his tenure of this office directed the conduct of the Chitral expedition in 1895 and the Tirah campaign in 1897. In the latter year he was made G.C.B. and in 1898 G.C.S.I. Returning to England in 1898 he became quartermaster-general to the forces; and on the outbreak of the Boer War in 1899 he was given command of the forces in Natal. He defeated the Boers at Elandslaagte on the 21st of October 1899 and at Krantzfontein on the 24th; but the superior numbers of the Boers enabled them to invest Ladysmith, which Sir George White defended in a siege lasting 119 days, from the 2nd of November 1899 to the 1st of March 1900, in the course of which he refused to entertain Sir Redvers Buller's suggestion that he should arrange terms of capitulation with the enemy (see Ladysmith, Siege and Relief of). After the relief of Ladysmith, White, whose health had been impaired by the siege, returned to England, and was appointed governor of Gibraltar (1900-1904). King Edward VII, who visited the fortress in 1903, personally gave him the baton of a field marshal. In 1905 Sir George White was appointed governor of Chelsea Hospital, and in the same year was decorated with the Order of Merit.

See T. F. C. Coates, Sir George White (1900).

WHITE, GILBERT (1720-1793), English writer on natural history, was born on the 18th of July 1720 in the little Hampshire village of Selborne, which his writings have rendered so familiar to all lovers of either books or nature. He was educated at Basingstoke under Thomas Warton, father of the poet, and subsequently at Oriel College, Oxford, where in 1744 he was elected to a fellowship. Ordained in 1747, he became curate at Swarraton the same year and at Selborne in 1751. In 1752 he was nominated Junior Fellow of his college. In 1753 he accepted the curacy of Durley, and in 1757 he was a candidate for the provostship of Oriel, but failed to secure election. Soon afterwards he received the college living of Moreton Pinkney, though he did not reside there, and in 1761 he became curate at Farlingdon, near Selborne, a position which he held until in 1784 he again became curate in his native parish. He died in his home, The Wakes, Selborne, on the 26th of June 1793.

Gilbert White's daily life was practically unbroken by any great happenings or incidents; for nearly half a century his pastoral duties, his watchful country walks, the assiduous care of his garden, and the scrupulous posting of his calendar of observations made up the essentials of a full and delightful life, but hardly of a biography. At most we can only fill up the portrait by reference to the tinge of simple old-fashioned scholarship, which on its historic side made him an eager searcher for antiquities and among old records, and on its poetic occasionally stirred him to an excursion as far as that gentlest slope of Tarnassus inhabited by the descriptive muse. Hence we are thrown back upon that correspondence with brother naturalists which has rankled in the few and its correspondence with other antiquities, and not only with his eldest brother, but with Linnaeus. The youngest, Henry, was vicar of Fyfeld, near Andover. The sister's son, Samuel Barker, also became in time one of White's most valued correspondents. With other naturalists, too, he had intimate relations: with Thomas Pennant and Daines Barrington he was in constant correspondence, often too with the botanist John Lightfoot, and sometimes with Sir Joseph Banks and others, while Richard Chandler and other antiquaries kept alive his historic zeal. At first he was content to furnish information from which the works of Pennant and Barrington largely profited; but gradually the ambition of separate authorship developed from a suggestion thrown out by the latter of these writers in 1770. The next year White sketched to Pennant the project of 'a natural history of my native parish, an annus historico-naturalis, comprising a journal for a whole
year, and illustrated with large notes and observations. Such a beginning might induce more able naturalists to write the history of various districts and might in time occasion the production of a work so much to be wished for—a full and complete natural history of these kingdoms.” Yet the famous Natural History and Antiquities of Selborne did not appear until 1789. It was well received from the beginning, and has been reprinted time after time.

To be a typical parish natural history so far as completeness or order is concerned, it has of course no pretensions; butches of letters, an essay on antiquities, a naturalist’s calendar and miscellaneous jottings of all kinds are but the un systematized material of which the book was composed. Yet there is in this very piecemeal character that its popularity has been due. The style has the simple, yet fresh and graphic, directness of all good letter-writing, and there is no lack of passages of keen observation, and even shrewd interpretation. White not only notes and ways, the times and seasons, of plants and animals—comparing, for instance, the different ways in which the squired, the fieldmouse and the nut-hatch eat their hazel-nuts—or watches the migrations of birds, which were then only beginning to be properly recorded or understood, but he knows more than any other observer until Charles Darwin about the habits and the usefulness of the various insects. The notes that pass along the hedge and the dew are to be learned. The book is also interesting as having appeared on the borderland between the medieval and the modern school of natural history. Scientifically it was old-fashioned; the old classification without entering on the technical and analytic character of the opening age of separate monographs. Moreover, as the first book which raised natural history into the region of literature, much as the Encyclopaedics, which that must generally consider as the more finished products of later writers like Thoreau or Richard Jefferies. Yet, while these are essential merits of the book, its enduring charm lies deeper, in the sweet and kindly personality of the author, who, on his rambles gathers no spoil, but watches the birds and field-mice without disturbing them from their nests, and quietly plants an acorn where he thinks an oak is wanted, or sows beechnuts in what is now a stately row. He overflows with anecdote, seldom indeed gets beyond the anecdotal stage, yet from this all study of nature must begin; and he sees everywhere intelligence and beauty, love and sociality, where a later view of nature insists primarily on monotony of habit, interests or powers. Also he is essentially an encyclopaedic interest in nature, although in White’s day culminating in the monumental synthesis of Buffon, was also disappearing before the analytic specialization inaugurated by Linnaeus; yet the cathartic interests of the simple naturalist of Selborne are fully regained a century later in the greater naturalist of Down, Charles Darwin.

The Life and Letters of Gilbert White of Selborne, by his great-grandnephew, Rashleigh Hold-White, appeared in 1901.

WHITE, HENRY KIRKE (1785-1856), English poet, was born at Nottingham, the son of a butcher, on the 21st of March 1785. He was educated for his father’s trade, but, after a short apprenticeship to a stocking-weaver, was eventually articled to a lawyer. Meanwhile he studied hard, and his master offered to release him from his contract if he had sufficient means to go to college. He received encouragement from Capel Lofft, the friend of Robert Bloomfield, and published in 1803 Clifton Grove, A Sketch in Verse, with other Poems, dedicated to Georgian, duchess of Devonshire. The book was violently attacked in the Monthly Review (February 1804), but White was in some degree compensated by a kind letter from Robert Southey. Through the efforts of his friends, he was entered as a sizar at St John’s College, Cambridge, spending a year beforehand with a private tutor. Close application to study induced a serious illness, and fears were entertained for his sanity, but he went into residence at Cambridge, with a view to taking holy orders, in the autumn of 1805. The strain of continuous study proved fatal, and he died on the 19th of October 1806. He was buried in the church of All Saints, Cambridge. The genuine piety of his religious verses secured a place in popular hymnology for some of his hymns. Most of them, due to his study inspired by his early death, but it is noteworthy that Byron is said to have agreed to work with Southey in forming a high estimate of the young man’s promise.

His Remains, with his letters and an account of his life, were edited (3 vols., 1809-1827) by Robert Southey. Sir Harris Nicolas to his Poetical Works (new cd., 1860) in the “Aldine Edition” of the British poets; by H. K. Swann in the volume of selected works (Centerbury) by which the book is included in the饮 Water of the edition in the “Muses’s Library.” See also J. T. Godfrey and J. Ward, The Homes and Haunts of Henry Kirke White (1908).

WHITE, HUGH LAWSON (1772–1840), American statesman, was born in Iredell county, North Carolina, on the 30th of October 1773. In 1812 he crossed the mountains into East Tennessee (then a part of North Carolina) with his father James White (1737–1819), who was subsequently prominent in the early history of Tennessee. Hugh became in 1796 secretary to Governor William Blount, and in 1792–1793 served under John Sevier, governor against the Creek and Cherokee Indians, and in the battle of Etowah (December 1793), according to the accepted tradition, killed with his own hand the Cherokee chief Kingfisher. He studied in Philadelphia and in 1796 he was admitted to the bar at Knoxville. He was a judge of the Superior Court of Tennessee in 1801–1807, a state senator in 1807–1809, and in 1809–1815 was judge of the newly organized Supreme Court of Errors and Appeals of the state. From 1812 to 1827 he was president of the State Bank of Tennessee at Knoxville, and managed it so well that for several years during this period it was the only western bank that in the trying period during and after the War of 1812 did not suspend specie payments. In 1821–1824 he was a member of the Spanish Claims Commission, and in 1825 succeeded Andrew Jackson in the United States Senate, serving until 1826 and being president pro temp. in 1832–1834. In the Senate he opposed internal improvements by the Federal government and the recharter of the United States Bank, favoured a protective tariff and Jackson’s coercive policy in regard to nullification, and in general supported the measures of President Jackson, though his opposition to the latter’s indisposition to appoint a successor, and the increase of localism and Jackson, which was increased by White’s refusal to vote to expunge the resolutions of a former Senate censuring the president. In 1830, as chairman of the Committee on Indian Affairs, he secured the passage of a bill looking to the removal of the Indians to lands west of the Mississippi. He was opposed to Van Buren’s candidate for the presidency in 1836, was himself nominated in several states as an independent candidate, and received the twenty-six electoral votes of Tennessee and Georgia, though President Jackson made strong efforts to defeat him in the former state. About 1838 he became a Whig in politics, and when the Democratic legislature of Tennessee instructed him to vote for Van Buren’s sub-treasury scheme he objected and resigned (Jan. 1840). His strict principles and his conservatism won for him the sobriquet of “The Cato of the United States Senate.” He died at Knoxville on the 10th of April 1840.

See Nancy N. Scott (ed.), A Memoir of Hugh Lawson White (Chattanooga, 1844).

WHITE, JOSEPH BLANCO (1775–1841), British theologian and poet, was born at Selvice on the 11th of July 1775. He was educated for the Roman Catholic priesthood; but after his ordination (1800) religious doubts led him to escape from Spain to England (1810), where he ultimately entered the Anglican Church, having studied theology at Oxford and made the friendship of Arnold, Newman and Whately. He became tutor in the family of the last-named when he was made archbishop of Dublin (1831). While in this position he embraced Unitarian views; and he found an asylum amongst the Unitarians of Liverpool, where he died on the 26th of May 1841.

White edited El Espláid, a monthly Spanish magazine in London, from 1810 to 1814, and afterwards received a civil list pension of £550. His principal writings are Dobrado’s Letters from Spain (1822); Evidence against Catholicism (1823); Second Travels of an Irish Gentleman in Search of a Religion (2 vols., 1834); Observations on Heresy and Orthodoxy (1835). They all show literary ability, and were extensively read in their day. He also translated parts of the Book of Common Prayer into Spanish. He is best remembered, however, by his sonnet “Night and Death” (“Mysteries Night! when our first parent knew”), which was dedicated to S. T. Coleridge on its appearance in the Bijou for 1828 and has since found its way into several anthologies. Three versions are given in the Academy of the 12th of September 1801.

WHITE, R. G.—WHITE, T.

WHITE, RICHARD GRANT (1822-1885), American Shakespearian scholar, philologist and essayist, was born in New York city, on the 23rd of May 1822. He graduated at the university of the City of New York in 1839, studied medicine and then law, and was admitted to the bar in 1845, but made no serious attempt to practice. He contributed anonymously to the New York Courier and Enquirer, of which he was co-editor in 1851-1858, and became a member of the staff of the New York World, when that paper was established in 1860. In 1861-1878 he was chief of the United States Revenue Marine Bureau, for the district of New York. When he was 21 years old he wrote his sonnet, "Washington: Pater Patriae," which, published anonymously, was frequently ascribed to Wordsworth, and by William Cullen Bryant was ascribed to Landor; White did not admit his authorship until 1852. In 1853 he contributed anonymously to Putnam's Magazine (October and November), an acute and destructive criticism of Collier's folio manuscript emendations of Shakespeare; and in the following year this criticism was republished (with other matter) in his Shakespeare's Scholar: being Historical and Critical Studies of his Text, Characters, and Commentaries; with an Examination of Mr Collier's Folio of 1623. During the Civil War he contributed to the Spectator, under the pseudonym, "A Yankee," a series of articles which greatly influenced English public opinion in favour of the North, while his clever and pungent satire, The American Shakespeare (1866)—also published anonymously—was an effective attack upon "copper-headism" and the advocates of "peace at any price." He died in New York on the 8th of April 1885.

In addition to those mentioned above, his Shakespearean publications include, Essay on the Authorship of the Three Parts of King Henry VI. (1853), Memoirs of the Life of William Shakespeare; with an Essay towards the Expression of his Genius, and an account of the Rise and Progress of the English Drama to the Time of Shakespeare (1865); an annotated edition of Shakespeare's works in 3 vols. (1883), and Studies in Shakespeare (1885), pleading for a rational treatment of the plays, without over-annotation, textual or aesthetic. On linguistic subjects he wrote Words and their Uses, Past and Present (1870), and a sequel, Every Day English (1880), which without linguistic thoroughness, stimulated interest in the general subject of good use in language. His other publications include National Hymns: How they are Written and How they are not Written (1861), containing some of the best and worst of 1000 hymns submitted to a committee of professional writers for a prize; a poem written for a national hymn; Poetry, Lyrical, Narrative and Satirical, of the Civil War (1866); The Fall of Man; or, The Loves of the Gorillas, By a Learned Gorilla (1871); Chronicles of Gotham. By U. Doornen Olferts, a Dutchman (1880), Eight Quakers, England Without and Within (1881), and The Fate of Mansfield Humphreys (1884), a novel. For estimates of White's critical writing see the review of Shakespeare's Scholar in the Eclectic Magazine, vol. xxxiv. (1855); and the articles in the Atlantic Monthly, vol. xx. (1882) by E. P. Whipple, and vol. livi. (1886).

His son, STANFORD WHITE (1833-1906), the famous architect, studied under Henry H. Richardson, whom he assisted in the designing of Trinity Church, Boston, and became a member of the New York firm of McKim, Mead & White in 1881. He designed the Madison Square Garden, the Century and Metropolitan Clubs in New York City, the buildings of the New York University and the University of Virginia, and the pedastals for the statue of St Paul at St S. Gaudens. He was murdered by Harry Haw in 1896.

WHITE, ROBERT (1645-1704), English engraver and draughtsman, was born in London in 1645. He studied engraving under David Loggan, for whom he executed many architectural subjects; his early works also include landscapes and engraved title-pages for books. He acquired great skill in portraiture, his works of this class being commonly drawn with black-lead pencil upon vellum, and afterwards excellently engraved in line. Portraits executed in this manner he marked at every turn and ridge, artfully concealed for their artistic merit and their authenticity. Vincent has ascribed to him 275 portraits by White, including the likenesses of many of the most celebrated personages of his day; and nine portraits engraved in mezzotint are assigned to him by J. Chaloner Smith. White died at Bloomsbury, London, in 1704. His son, George White, who was born about 1671 and died about 1734, is also known as a draughtsman and portraitist, and Engravings by him are in the Bibliothèque nationale at Paris. White engraved a large number of the portraits in his father's works.

WHITE, SIR THOMAS (1492-1567), founder of St John's College, Oxford, was a son of William White, a colthier, and was born at Reading. At an early age he became a merchant in London and was soon a member, and then master of the Merchant Taylors Company; growing wealthier he became an alderman and sheriff of the city of London. One of the promoters of the Muscovy Company, he was knighted in 1553, and in October of the same year he was chosen lord mayor. His term of office fell in a strenuous time. He had to defend the city against Sir Thomas Wyatt and his followers, and he took part in the trial of the rebels, as just previously he had done in the case of Lady Jane Grey. In 1555 White received a licence to found a college at Oxford, which he endowed with lands in the neighbourhood of the city and which, dedicated to the Virgin Mary and St John Baptist, was opened in 1560. Soon after this event Sir Thomas began to lose money, and he was comparatively poor when he died at Oxford on the 12th of February 1567. His later years were mainly spent in Oxford, and he was buried in the chapel of St John's College. White had some share in founding the Merchant Taylors' School in London. He was twice married, but left no children. A portrait of him hanging in the hall of St John's College and one on glass, painted in the 16th century, is in the old library. Several early lives of him are among the college manuscripts. Sir Thomas must be distinguished from another Sir Thomas White of South Warnborough, Hampshire, some of whose property, by a curious coincidence, passed also into the possession of St John's College.

WHITE, THOMAS (c. 1530-1624), English divine, was born at Bristol about 1530, the son of a clothier. He graduated from Magdalen Hall (now Hertford College), Oxford; in 1579; took holy orders, and, coming to London, became rector of St Gregory by St Paul's and shortly after vicar of St Dunstan's in the West. Several of his sermons, attacking play-going and the vices of the metropolis, were printed. He was a prebendary of St Paul's, treasurer of Salisbury, canon of Christ Church, Oxford, and canon of Windsor. In 1613 he built and endowed an almshouse, called the Temple Hospital, in Bristol. In 1621 he founded what is now known as White's chair of moral philosophy at Oxford, with a salary of £200 per annum for the reader, and several small exhibitions for scholars of Magdalen Hall. He was the first of Magdalen to give £1000 (in 1662) to support as a house of study the university scheme of "all the ministers, parson, vicar, lecturer and curate in London and its suburbs" (afterwards Sion College (q.v.)), and an almshouse, now abolished, and leaving bequests for lectureships at St Paul's, St Dunstan's and at Newgate.

WHITE, THOMAS (1628-1669), bishop of Peterborough, was born at Aldington in Kent, and educated at St John's College, Cambridge. Having taken holy orders, he became vicar of Newark-on-Trent in 1660, vicar of Allhallows the Great, London, in 1666, and vicar of Betteshorne, Leicestershire, in 1679. In 1684 he was appointed chaplain to the princess Anne, and in 1685 he was chosen bishop of Peterborough. In 1688 he joined the archbishop of Canterbury, William Sancroft, and five of his suffragan bishops in petitioning against the declaration of indulgence issued by James II., sharing the trial and the triumphant acquisit of his colleagues. In 1689 he refused to take the oath of allegiance to William and Mary and was deprived of his see, but he did not become very active among the nonjurors. White died on the 30th of May 1698.

The bishop must be distinguished not only from the founder of Sion College, but also from Thomas White (1593-1676), philosopher and controversialist. Educated at St Omer, Valladolid and Douai, the latter was ordained priest in 1617, and taught for some years in the college at Douai. Later he was president of the English college at Lisbon. He died in London on the 6th
of July 1876. White was a voluminous writer; not only did he
engage in controversy with Protestants, but he attacked the
personal infallibility of the pope.

**WHITE, SIR WILLIAM ARTHUR** (1824-1891), British
diplomatist, was born at Pulawy, in Poland, on the 13th of
February 1824. He was descended on his father's side from an
Irish Roman Catholic family. His mother's family, though not
of that race, were of considerable influence in Poland, where
White, though educated at King William's College, Isle of Man,
and Trinity College, Cambridge, spent a great part of his early
days, and thus gained an intimate knowledge of the Slavonic
tongues. From 1843 to 1857 he lived in Poland as a country
gentleman, but in the latter year he accepted a post in the British
consul at Warsaw, and had almost at once to perform the
duties of acting consul-general. The insurrection of 1863 gave
him an opportunity of showing his immense knowledge of Eastern
politics and his combination of diplomatic tact with resolute
determination. He was promoted in 1864 to the post of consul
dat Danzig. The Eastern Question was, however, the great
passion of his life, and in 1875 he succeeded in getting transferred
to Belgrade as consul-general for Servia. In 1879 he was made
British Agent at Bucharest. In 1884 he was offered by Lord
Granville the choice of the legation at Rio or Buenos Aires, and
in 1885 Lord Salisbury, who was then at the Foreign Office,
urged him to go to Peking, pointing out the increasing import-
ance of that post. White's devoted friend, Sir Robert Morier,
wrote in the same sense. But White, who was already acting
as Counsel, was unwilling to leave his friends at Constantinople,
and during this year he rendered one of his most conspicuous
services. It was largely owing to his efforts that the war between
Servia and Bulgaria was prevented from spreading into a
universal conflagration, and that the union of Bulgaria and
eastern Rumelia was accepted by the powers. In the following
year he was rewarded with the embassy at Constantinople.
He was the first Roman Catholic appointed to a British embassy
since the Reformation. He pursued consistently the policy of
counteracting Russian influence in the Balkans by erecting a
barrier of independent states animated with a healthy spirit of
national life, and by supporting Austrian interests in the East.
To the furtherance of this policy he brought an unrivalled
knowledge of all the under-currents of Oriental intrigue, which
his mastery of languages enabled him to derive not only from the
newspapers, of which he was an assiduous reader, but from the
obscurest sources. His bluff and straightforward manner, and
the knowledge that with him the deed was ready to follow the
word, enabled him at once to inspire confidence and to overawe
less masterful rivals. The official honours bestowed on him
culminated in 1888 with the G.C.B. and a seat on the Privy
Council. He was also made a fellow of Trinity College, and as
principal assistant professor at Constantinople when he
was attacked by influenza during a visit to Berlin, where he died
on the 28th of December 1891.

**WHITE, SIR WILLIAM HENRY** (1845- ), English naval
architect, was born at Devonport on the 2nd of February 1845,
and at the age of fourteen became an apprentice in the dockyard
there. In 1864 he took the first place in the scholarship com-
petition at the Royal School of Naval Architecture, which had
then just been established by the Admiralty at South Kensington,
and in 1867 he gained his diploma as fellow of the school with
first-class honours. At once joining the constructive staff of the
Admiralty, he acted as confidential assistant to the chief con-
structor, Sir Edward Reed, until the latter's retirement in 1870.
The loss of the "Captain" in that year was followed by an
inquiry into designs for ships of war, and in connexion with this
White, together with his old fellow-student, William John,
worked out a long series of calculations as to the stability and
strength of vessels, the results of which were published in an
important paper read in 1871 before the Institution of Naval
Architects. In 1872 White was appointed secretary to the
Council of Construction at the Admiralty, in 1873 assistant con-
structor, and in 1881 chief constructor. In April 1883 he left
the service of the Admiralty, at the invitation of Lord (then Sir
W. G.) Armstrong, in order to undertake the difficult task of
organizing a department for the construction of warships of the
largest size at the Elswick works; but he only remained there
for two and a half years, for in October 1885 he returned to the
Admiralty in succession to Sir Nathaniel Barnaby as director of
naval construction, retaining that post until the beginning of
1902, when ill-health obliged him to relinquish the arduous labours
it entailed. During that period, which in Great Britain was one of unprecedented activity in naval shipbuilding as a result of the awakening of public opinion to the vital importance of sea-power, more than 200 vessels of various types were added to the British navy, at a total cost of something like 200 millions sterling, and for the design of all of these, as well as for the work of their construction, Sir William White was ultimately responsible.

In addition, he did much to further the knowledge of scientific
shipbuilding. He was professor of naval architecture at the Royal School from 1870 to 1873, and when in the latter
year it was moved to Greenwich to be merged in the Royal Naval
College, he reorganized the course of instruction and acted as
professor for eight years more. The lectures he gave in that
capacity were the foundation of his Manual of Naval Architecture,
which has been translated into several foreign languages and is
recognized as a standard text-book all over the world. Sir
William White, who was chosen a fellow of the Royal Society
in 1888, also read many professional papers before various
learned and engineering societies. He was created K.C.B. in
1895.

**WHITEAVES, JOSEPH FREDERICK** (1835— ), British
palaeontologist, was born at Oxford, on the 26th of December
1835. He was educated at private schools, and afterwards
worked under John Phillips at Oxford (1858-1861); he was led
to study the Oolitic rocks, and added largely to our knowledge
of the fossils of the Great Oolite series, Cornbrash and Corallian
visited Canada and made acquaintance with the geology of
Quebec and Montreal, and in 1863 he was appointed curator of
the museum and secretary of the Natural History Society of
Montreal, posts which he occupied until 1875. He studied the
land and freshwater mollusca of Lower Canada, and the marine
invertebrates of the coast; and also carried on researches among
the older Silurian (or Ordovician) fossils of the neighbourhood of
Montreal. In 1875 he joined the palaeontological branch of the
Geological Survey of Canada at Montreal; in the following
year he became palaeontologist, and in 1877 he was further
appointed zoologist and assistant director of the survey. In 1881
the offices of the survey were removed to Ottawa. His publica-
tions on Canadian zoology and palaeontology are numerous and
important. Dr Whiteaves was one of the original fellows of the
Royal Society of Canada, and contributed to its Transactions,
as well as to the Canadian Naturalist and other journals. He
received the hon. degree of LL.D. in 1900 from McGill University,
Montreal.

**WHITEBAIT,** the vernacular name of the small fish which
appears in large shoals in the estuary of the Thames during
the summer months, and is held in great esteem as a delicacy for
the table. Formerly whitebait was supposed to be a distinct species
of fish. T. Pennant and G. Shaw believed it to be some kind
of Cypriodin fish, similar to the bleak, whilst E. Donovan, in his
*Natural History of British Fishes* (1832-1868), misled by speci-
mens sent to him by the young fyr of herrings and sprats in
varying proportions mixed with a few shrimps, gobies, stickle-
backs, pope-fishes and young flounders; but these impurities
are as far as possible picked out from the whitebait before it is
marketed. The fishing is carried on from February to August, and samples taken in the successive months were found to contain the following percentages of herrings, the remainder being young sprats: 7, 5, 14, 30, 87, 75, 52. Hence it will be seen that sprats predominated in February, March, April and May, herrings in June and July. There is reason to believe that these young herrings are derived from a local “winter” race spawning about February and March, and having nothing to do with the great shoals of the many open sea spawning in the North Sea in November. The Thames being unequal to the supply of the large demand for this delicacy, large quantities of whitebait are now brought to London and other markets from many parts of the coast. In times past whitebait were considered to be peculiar to the estuary of the Thames; and, even after the specific identification of Thames whitebait with the young of the herring and sprat, it was still thought that there was a distinctive superiority in its condition and flavour. It is possible that the young fish find in the estuary of the Thames a larger amount of suitable food than on other parts of the coast, where the water may be of greater purity, but possesses less abundance of the minute animal life on which whitebait thrive. Indeed, Thames whitebait have been compared with that from the mouth of the Exe, the Cornish coast, Menai Strait, and the Firth of Forth seemed to be better fed; but, of course, the specific characteristics of the herring and sprat—into which we need not enter—are distinctively Thamesian.

The fry of fishes is used as an article of diet in almost every country: in Germany the young of various species of Cyprinoids, in Italy and Japan the young of nearly every fish capable of being readily captured in sufficient numbers, in the South Sea Islands the fry of Teuthis, in New Zealand young Galaxias are consumed at certain seasons in large quantities; and, like whitebait, these fry bear distinct names, different from those of the adult fish.

Whitebait are caught on the flood-tide from boats moored in from 3 to 5 fathoms of water. The net used is a bag something like a long, narrow and small-meshed towards the tail end, the mouth being kept open in the direction of the advancing tide by a framework 3 or 4 ft. It is placed alongside the boat and sunk to a depth of 4 ft. below the surface; from time to time the end of the bag is lifted into the boat, to empty it of its contents. The “schools” of whitebait advancing and retiring with the tide for days, and probably for weeks, have to run the gauntlet of a dozen of these nets, and therefore get very much thinned in number by the end of the season. When the view commenced to gain ground that whitebait were largely young herring, the question arose whether or not the immense destruction of the young brood caused thereby was injuriously affected the fishery of the mature herring. This point it does; but, since it has been ascertained that the herring is much more restricted in its migrations than was formerly believed, and that the shoals move perhaps as much as 20 miles a day, the inference is that the whitebait is methodically practised. Similar reasoning applies to sprats.

WHITEFIELD, GEORGE (1714-1770), English religious leader, was born on the 16th of December 1714 at the Bell Inn, Gloucester, of which his father was landlord. At about twelve years of age he was sent to the school of St Mary de Crypt, Gloucester, where he developed some skill in elocution and a taste for reading plays, a circumstance which probably had considerable influence on his subsequent career. At the age of fifteen he was taken from school to assist his mother in the public-house, and for a year and a half was a common drawer. He then again returned to school to prepare for the university, and in 1733 entered as a servitor at Pembroke College, Oxford, graduating in 1736. There he came under the influence of the Methodists (see Wesley), and entered so enthusiastically into their practices and habits that he was attacked by a severe illness, which compelled him to return to his native town. His enthusiastic piety attracted the notice of Martin Benson, bishop of Gloucester, who ordained him deacon on the 20th of June 1736. He then began an evangelizing tour in Bath, Bristol, and other towns, his eloquence at once attracting immense multitudes. In 1736 he was invited by Wesley to go out as missionary to Georgia, and went to London to wait on the trustees. Before setting sail he preached in some of the principal London churches, and in order to hear him, crowds assembled at the church doors long before daybreak. On the 28th of December 1737 he embarked for Georgia, which he reached on the 7th of May 1738. After three months’ residence there he returned to England to receive priest’s orders, and to raise contributions for the establishment of an orphanage. As the clergy did not welcome him to their pulpits, he began to preach in the open air. At Kingswood Hill, Bristol, his addresses to the colliers soon attracted crowds, and his voice was so clear and powerful that it could reach 20,000 folk. His fervour and dramatic action held them spell-bound, and his homely pathos soon broke down all barriers of resistance. “The first discovery of their being affected,” he says, “was by seeing the white gutters made by their tears, which plentifully fell down their black cheeks.” In 1738 an account of Whitefield’s voyage from London to Georgia was published without his knowledge. In 1739 he published his Journal from his arrival in Savannah to his return to London, and also his Journal from his arrival in London to his departure thence on his way to Georgia. As his embarkation was further delayed for ten weeks he published A Continuation of the Rev. Mr Whitefield’s Journal during the Time he was delayed in England by the Embargo. His unfavourable reception in England by the clergy led him to make replays. To Joseph Trapp’s attack on the Methodists he published in 1739 A Preparation against Unseated Notes, in which the clergy of the Church of England were denounced with some bitterness; he also published shortly afterwards The Spirit and Doctrine and Lives of our Modern Clergy, and a reply to a pastoral letter of the bishop of London in which he had been attacked. In the same year appeared Sermons on Various Subjects (2 vols.), the Church Companion, or Sermons on Several Subjects, and a recommendatory epistle to the Life of Thomas Halyburton. He again embarked for America in August 1739, and remained there two years, preaching in all the principal towns. He left his inheritance to take the new project to Savannah and the missionary court at Charleston suspended him for ceremonial irregularities. While there he published Three Letters from Mr Whitefield, in which he referred to the “mystery of iniquity” in Tillotson, and asserted that that divine knew no more of Christ than Mahomet did.

During his absence from England Whitefield found that a divergence of doctrine from Calvinism had been introduced by Wesley; and notwithstanding Wesley’s exterminations to brotherly kindness and forbearance he withdrew from the Wesleyan connexion. Thereupon his friends built for him near Wesley’s published wooden structure, which was named the Moorfields Tabernacle. A reconciliation between the two great evangelists was soon effected, but each thenceforth went his own way. In 1741, on the invitation of Ralph and Ebenezer Erskine, he paid a visit to Scotland, commencing his labours in the Secession meeting-house, Dunfermline. But, as he refused to limit his ministrations to one sect, the Seceders and he parted company, and without their countenance he made a tour through the principal towns of Scotland, the authorities of which in most instances presented him with the freedom of the burgh, in token of their estimate of the benefits to the community resulting from his preaching. From Scotland he went to Wales, where on the 14th of November he married a widow named James. The marriage was not a happy one. On his return to London in 1742 he preached to the crowds in Moorfields during the Whitson holidays with such effect as to attract nearly all the people from the shows. After a second visit to Scotland, June-October 1742 (where at Cambuslang in particular he wielded a great spiritual influence), and a tour through England and Wales, 1742-1744, he embarked in August 1744 for America, where he remained till June 1748. On returning to London he found his congregation at the Tabernacle dispersed; and his circumstances so depressed that he was obliged to sell his household furniture to pay his orphan-house debts. Relief soon came through his acquaintance with Selina, countess of Huntingdon (q.v.), who appointed him one of her chaplains.
The remainder of Whitefield's life was spent chiefly in evangelizing tours in Great Britain, Ireland and America. It has been stated that "in the compass of a single week, and that for years, he spoke in general forty hours, and in very many sixty, and to thousands.' In 1748 the synods of Glasgow, Perth and Lothian passed a general resolution to exclude him from their churches; in 1753 he compiled his hymn-book, and in 1756 opened the chapel which still bears his name in Tottenham Court Road. On his return from America to England for the last time he was placed in municipal 1850. 1758 wet or 42x153 and of 43x46 and 43x114 and employed during 43x231 northerm. found and 44x327 oratorical inhabiting orphanage "September 45x541 On 46x640 Lothian he stated 47x688 that his 47x708 died. 49x621 "WHITEHALL, Whitefield's 51x640 his 52x659 belonged to 54x249 fer a 55x259 vandesius) 56x429 W. 57x172 "WHITEFISH, has 58x492 Whitefield's 59x661 died. 60x251 from Derwentwater and Bassenthwaite lakes in Cumberland. About eight species are distinguished from the northern parts of North America. The Coregonus are mostly of small size, few of them attaining a length of 18 in. Secondary nuptial sexual characters are by no means so well marked as in Salmo, but pearl-like excrescences may appear on the scales during the breeding season, and are more prominent in males than in females. The Coregonus group are somewhat herring-shaped, silvery salmonids with small, toothless or feebly toothed mouth, and rather large scales. They are distributed over Europe, Asia and North America, some species living in the sea, but most inhabiting clear lakes. The highly esteemed 'lavaret' of Savoy, the 'felchen,' "kilch," "gangisch," "palee," "gravenche," "féa" or Switzerland and southern Germany, the "sik" of Sweden, belong to this genus, which is represented in British and Irish waters by the houting (C. oxyrhynchos), occasionally found in England. The Coregonus of Loch Lomond, Haweswater, Ullswater and Bal, the vendace (C. vandusius) of Lochmaben, and its newly described ally (C. gracilior) from Derwentwater and Bassenthwaite lakes in Cumberland. Whitehall is a village of Washington county, New York, U.S.A., in a township of the same name on the Poultney river and the Champlain Canal, at the head of Lake Champlain, and 78 m. by rail N. by E. of Albany. Pop. (1890) 4343; (1900) 4377, of whom 517 were foreign-born; (1905) 4148; (1910) 4017. Whitehall is served by the Delaware & Hudson railway, and is the N. terminus of the new large-canal system of New York state. It is situated in a narrow valley between two hills called West Mountain and Skene's Mountain, and Wood Creek flows through the village and empties into the lake with a fall, from which valuable water-power is derived; there are various manufactures, and the village owns and operates the water works. In 1759, to strengthen the British hold on Canada, a large tract of land at the S. end of Lake Champlain was granted to Colonel Philip Skene (1725-1810), who fought at Ticonderoga in 1758 and in 1759, and who established here in 1761 a settlement of about thirty families which he called Skensboro and which was patented in 1765. Skene was a Loyalist, and in May 1775 Skensboro was seized by a party of American volunteers. But it speedily recovered its footing (1777) Skene and his son, Andrew Philip Skene (1728-1826). In 1844 the settlement and Skensboro was recovered by the British after most of it had been burned by the Americans. At the close of the war Skene's estate was confiscated and in 1786 the place was named Whitehall. In the War of 1812 Whitehall was fortified and was a base of supplies for American operations against Canada. It was incorporated as a village in 1866.

**WHITEHAVEN, a municipal and parliamentary borough, seaport and market town of Cumberland, England, 41 m. S.W. of Carlisle. Pop. (1901) 19,324. It lies mainly in a valley opening upon the Irish Sea, with high ground to north, south, and west, and is served by the London & North-Western, the Cockermouth, Keswick & Penrith and the Furness railways. The harbour is protected by two main piers, of which the western is a fine structure by Sir John Rennie, and divided into four parts by others; it has a wet dock and extensive quarantine. Regular passenger communications are maintained with the Isle of Man. The exports are principally coal, pig iron and ore, steel and stone. The port was made subordinate to that of Maryport in 1802. There are collieries near the town, the workings extending beyond the town by the coal-mines and works, engineering works, shipbuilding yards, breweries, foundries, brick and earthenware works, and other industrial establishments in and near the town. The parliamentary borough returns one member. The municipal borough is under a mayor, 6 aldermen and 18 councillors. Area 1810 acres.**

Whitehaven (Whithafen) was an insignificant possession of the priory of St Bee which became crown property at the dissolution of the religious houses. It was acquired before 1644 by relatives of the earl of Lonsdale, who secured the prosperity of the town by working the coal-mines. From 1708 the harbour was governed by twenty-one trustees, whose power was extended and municipalized by frequent legislation, until, in 1885, they were incorporated. In 1894 this government by incorporated trustees gave place to that of a municipal corporation created by charter in that year. The harbour was entrusted to fifteen commissioners. Since the Reform Act of 1832 Whitehaven has returned one representative to parliament. A weekly market and yearly fairs were granted to St John Lowther in 1666; two fairs were held in 1888; and the market days are now Tuesday, Thursday and Saturday. Whitehaven coal was sent chiefly to Ireland before the American war, and the export to Ireland was considerable, but the British soldier consumed large amounts of this coal, and during the American war naval stores were also exported. In 1800, when American war was declared, other exports were lime, freestone, and grain; West Indian, American and Baltic produce, Irish flax and Welsh pig iron were imported, and shipbuilding was a growing industry. Paul Jones, the notorious buccanneer, served his apprenticeship at the port, which in 1778 he successfully raided, burning three vessels.

**WHITEHEAD, WILLIAM (1725-1785), English poet-laureate, son of a baker, was born at Cambridge, and baptized on the 22th of February 1715. His father had extravagant tastes, and spent large sums in ornamenting a piece of land near Grantchester, afterward called known as "Whitehead's Garden," where William was his second son, and through the patronage of Henry Bromley, afterwards Lord Montfort, was admitted to Winchester College. In 1735 he entered Clare Hall, Cambridge, as a sizar, and became a fellow in 1742. At Cambridge Whitehead published an epistle "On the Danger of writing Verse" and some other poems, notably an heroic epic, _Ann Belamy to Henry the Eighth_ (1743), and a didactic _Essay an Ridicule_ (1743). In 1745 he became tutor to Viscount Villiers, son of the earl of Jersey, and took up his residence in London. He produced two tragedies: _The Roman Father_ (Drury Lane, 24th of February 1750), and _Emera_, _Queen of Athens_ (Drury Lane, 20th of April 1750), and _Cecusa, The plots are based respectively on the _Horace of Cornelle, and the Ion_ of Euripides. In June 1754 he went abroad with Lord Villiers, 1 Printed in _A Collection of Poems by several Hands_ (vol. ii., 1748).
and his companion Viscount Nunemach, son of Earl Harcourt, only returning to England in the autumn of 1756. In 1757 he was appointed poet-laureate in succession to Cibber, and proceeded to write annual effusions in the royal honour. That he was not altogether happy in his position, which was discredited by the fierce attacks made on his predecessor, Colley Cibber, appears from "A Pathetic Apology for all Laureates, past, present and to come." Charles Churchill attacked him in 1762, in the third book of The Ghost, as the heir of Dullness and Method. In the same year Whitehead produced his most successful work in the comedy of the School for Lovers, produced at Drury Lane on the 16th of February. This success encouraged David Garrick to make him his reader of plays. In November, he was admitted into the company of the Theatre Royal, Drury Lane. The next year he wrote the first act of the play called The Trip to Scotland, which was performed on the 6th of January 1770. He collected his Plays and Poems in 1774. He had for some time, after his return from the Continent, resided in the house of his patrons, but from 1769 he lived in London, where he died on the 14th of April 1785. Beside the works already mentioned, Whitehead wrote a burlesque poem, The Sweeper, a number of verse contes, of which "Variety" and "The Goat's Beard" are good examples, and much occasional and official verse.

Several memoirs by his friend William Mason, prefixed to a complete edition of his poems (York, 1788). His plays are printed in Bell's British Theatre (vols. 1, 7, 20 and other collections, and his poems appear in Chalmers's Works of the English Poets (vol. 17) and similar compendia.

WHITE HORSE, VALE OF, the name of the valley of the Ock, a stream which joins the Thames from the west at Abingdon in Berkshire, England. The vale is flat and well wooded, its green meadows and foliage contrasting richly with the bald summits of the White Horse Hills, which flank it on the south. On the north a lower ridge separates it from the upper Thames valley; but local usage sometimes extends the vale to cover all the ground between the Cotswolds (on the north) and the Vale of White Horse (on the south). The vale is a topographical term, although, however, the vale is from 2 to 5 m. wide, and the distance by road from Abingdon to Shrivenham at its head is 18 m. Wantage is the only town in the heart of the vale, lying in a sheltered hollow at the foot of the hills, along which, moreover, villages are more numerous than elsewhere in the vale. Towards the west, above Ufton, the hills reach a culminating point of 806 ft. in White Horse Hill. In its northern flank, just below the summit, a gigantic figure of a horse is cut, the turf being removed to show the white chalky soil beneath. This figure gives name to the hill, the long and of the range, but it is of more archaeological than topographical interest, and it is said to stand on a bed of chalk three feet thick. The face was carved by some ancient heathen using the crudest tools to represent an animal, and no one knows its name. Tradition asserted it to be the monument of a victory over the Danes by King Alfred, who was born at Wantage; but the site of the battle, that of Ashdown (871), has been variously located. Moreover, the figure, with others of a similar character elsewhere in England, is considered to be of a higher antiquity, dating even from before the Roman occupation. Many ancient remains occur in the vicinity of the Horse. On the summit of the hill there is an extensive and well-preserved circular camp, apparently used by the Romans, but of earlier origin. It is named Ufton Castle from the village in the vale below. Within a short distance are Hardwick Castle, a square work, and, on the southern slope of the hills near Ashdown Park, a small camp traditionally called Alfred's. A smooth, steep gully on the north flank of White Horse Hill is called the Manger, and to the west of it rises a bald mound named Dragon's Hill, the traditional scene of St George's victory over the dragon, the blood of which made the ground bare of grass for ever. But the name, properly Pendaragon, is a Celtic form signifying "chief of kings," and may point to an early place of burial. To the west of White Horse Hill lies a cromlech called Wayland Smith's Cave, said to be the home of a smith who was never seen, but shod the horses of travellers if they were left at the place with payment. The legend is elaborated, and the smith appears as a character, in Sir Walter Scott's novel Kenilworth. The White Horse itself has been carefully cleared of vegetation from time to time, and the process, known as the "Scouring of the White Horse," was formerly made the occasion of a festival. Sports of all kinds were held, and keen rivalry was maintained, not only between the inhabitants of the local villages, but between local kalends and those from distant parts of England. The first of such festivals known took place in 1755, and they died out only subsequently to 1857. A grassy track runs beside the ancient road or Ridge Way along the crest of the hills continuing Icknield Street, from the Chiltern Hills to the north-east, across the Thames; and other earthworks in addition to those near the White Horse overlook the vale, such as Letcombe Castle above Wantage. At the foot of the hills not far east of the Horse is preserved the so-called Blowing Stone, a mass of sandstone with a hole through it, which according to legend is a trumpet loud note is produced. It is believed that in the earliest times the stone served the purpose of a bell. Several of the village churches in the vale are of interest, notably the fine Early English cruciform building at Ufton. The length of the vale is traversed by the main line of the Great Western railway, between Didcot and Swindon.

"See Thomas Hughes, The Scouring of the White Horse (1859)."

WHITEING, RICHARD (1840— ), English author and journalist, was born in London on the 27th of July 1840, the son of a civil servant. He was a pupil of Benjamin Wyon, medallist and engraver, and studied under him for a time, and wrote several books of papers in the Evening Star in 1866, printed separately in the next year as Mr Sprouts, His Opinions. He became leader-writer and correspondent on the Morning Star, and was subsequently on the staff of the Manchester Guardian, the New York World, and for many years the Daily News, resigning from the last-named paper in 1899. His novel The Democracy (3 vols., 1876) was published under the pseudonym of Whyte Thorne. His remarkable story The Island (1888) attracted little attention until, years afterwards, its successor, No. 5 John Street (1899), made him famous; the earlier novel was then republished. Later works were Mr Sprouts (1899), The Drop on the Wave (1900), and All Moonshine (1907).

WHITELEY, WILLIAM (1831—1907), English "Universal Provider," was born at Agbrig, near Wakefield, Yorkshire, on the 20th of September 1831, the son of a corn-factor. At the age of sixteen he was apprenticed to a firm of drapers at Wakefield. In 1851 he made his first visit to London to see the Great Exhibition, and was so impressed with the size and activity of the metropolis that he determined to settle there as soon as his apprenticeship was over. A year later he obtained a subordinate position in a draper's establishment in the city, and after studying the drapery trade in this and other London establishments for ten years, in 1863 himself opened a small shop for the sale of fancy drapery in Westbourne Grove, Bayswater. His capital amounted to about £700, which he had saved from his salaries and commissions, and he at first employed two young girls and an errand boy. Friends in the trade had assured him that Westbourne Grove was one of the two worst streets in London for his business, but Whiteley had noted the number and quality of the people who passed the premises every afternoon, and relied on his own judgment. Events justified his confidence, and within a year he was employing fifteen hands. He made a consistent practice of marking all goods in plain figures and of "dressing" his shop-window attractively, both unusual features in the retail trading of the time, and to this, coupled with the fact that he was satisfied with small profits, he largely attributed a success in which his own genius for organization and energy played a conspicuous part. In 1866 Whiteley added general drapery to his other business, opening by degrees shop after shop and department after department, till he was finally enabled to call himself the "Universal Provider," a term that there was nothing which his stores could not supply. "Whiteley's was, in fact, the first great instance of a large general goods store in London, held under one man's control. In 1899 the business, of which the profits then averaged over £100,000 per annum, was turned into a limited liability company; Whiteley retaining the bulk of the shares. On the 23rd of January 1907 he was shot dead, after an interview in his private
office, by Horace George Rayner, who claimed (but, as was proved, wrongly) to be his illegitimate son and who had been refused pecuniary assistance. Rayner was found guilty of murder, and sentenced to be hanged; but the home secretary (Mr Herbert Gladstone), in response to an agitation for his reprieve, commuted the sentence to penal servitude for life.

WHITELOCKE, SIR JAMES (1570–1632), English judge, son of Richard Whitelocke, a London merchant, was born on the 28th of November 1570. Educated at Merchant Taylors' School, London, and at St John's College, Oxford, he became a fellow of his college and a barrister. He was then engaged in managing the estates belonging to St John's College, Eton College and Westminster College, before he became recorder of Woodstock and member of parliament for the borough in 1610. In 1620 Whitelocke was made chief justice of the court of session of the county palatine of Chester, and was knighted; in 1624 he was appointed justice of the court of king's bench. He died at Fawley Court, near Reading, an estate which he had bought in 1616, on the 22nd of June 1632. His wife, Elizabeth, was a daughter of Edward Bulstrode of Hedgerley Bulstrode, Buckinghamshire, and his son was Bulstrode Whitelocke.

Sir James was greatly interested in antiquarian studies, and was the author of several papers which are printed in T. Hearne's Collection of his papers (1737). His journal of his journey to Spain, in 1618, and the manner in which he was attacked by a robber in the night, is related in the life of Sir John Bruce published by the Camden Society in 1856.

Whitelocke's elder brother, EDMUND WHITELOCKE (1569–1668), was a soldier in France and later a courtier in England. He was imprisoned because he was suspected of being concerned in the Gunpowder Plot, and although he was most probably innocent, he remained for some time in the Tower of London.

The soldier JOHN WHITELOCKE (1575–1833) was doubtless a descendant of Sir James Whitelocke. He entered the army in 1778 and served in Jamaica and in San Domingo. In 1805 he was made a lieutenant-general and inspector-general of recruiting, and in 1807 he was appointed to command an expedition sent to Hamburg from Harwich. He landed at the town, the city was stubbornly resisted, and then Whitelocke concluded an arrangement with the opposing general by which he abandoned the undertaking. This proceeding was regarded with great disfavour both by the soldiers and others in South America and in England, and its author was brought before a court-martial in 1808. On all the charges except one he was found guilty and he was dismissed from the service. He lived in retirement until his death on the 23rd of October 1833.

WHITELOCKE, BULSTRODE (1605–1675), English lawyer and parliamentarian, eldest son of Sir James Whitelocke, was baptized on the 10th of August 1605, and educated at Merchant Taylors' School and at St John's College, Oxford, where he matriculated on the 8th of December 1620. He left Oxford, without a degree, for the Middle Temple, and was called to the bar in 1626 and chosen treasurer in 1628. He was fond of field sports and of music, and in 1643 he had charge of the music in the great masque performed by the inns of court before the king and queen. Meanwhile he had been elected for Stafford in the parliament of 1626 and had been appointed recorder of Abingdon and Henley. In 1630 he was chosen member for Great Marlow in the Long Parliament. He took a prominent part in the proceedings against Strafford, was chairman of the committee of management, and had charge of articles XIX.–XXIV. of the impeachment. He drew up the bill for making parliaments indissoluble except by their own consent, and supported the Grand Remonstrance and the action taken in the Commons against the illegal canons; on the militia question, however, he advocated a joint control by king and parliament. On the outbreak of the Great Rebellion he took the side of the parliament, using his influence in the county as deputy-lieutenant to prevent the king's raising troops in Buckinghamshire and Oxfordshire. He was sent to the king at Oxford both in 1643 and 1644 to negotiate terms, and the secret communications with Charles on the latter occasion were the foundation of a charge of treason brought against Whitelocke and Denzil Holles (q.v.) later. He was again one of the commissioners at Uxbridge in 1645.

Nevertheless he opposed the policy of Holles and the peace party and the proposed disbanding of the army in 1647, and though one of the lay members of the assembly of divines, repudiated the claims of divine authority put forward by the Presbyterians for their church, and approved of religious tolerance. He took the use of English in council; he thus stood against the army party, but he took no part either in the disputes between the army and the parliament or in the trial of the king. On the establishment of the Commonwealth, though out of sympathy with the government, he was nominated to the council of state and a commissioner of the new Great Seal. He urged Cromwell after the battle of Worcester and again in 1652 to recall the royal family, while in 1653 he disapproved of the expulsion of the Long Parliament and was especially marked out for attack by Cromwell in his speech on that occasion. Later in the autumn, and perhaps on consequence, Whitelocke was despatched on a mission to Christiana, queen of Sweden, to conclude a treaty of alliance and assure the freedom of the Sound. On his return he resumed his office as commissioner of the Great Seal, was appointed a commissioner of the treasury with a salary of £1,000, and was returned to the parliament of 1654 for each of the four constituencies of Bedford, Exeter, Oxford and Buckinghamshire, electing to sit for the latter constituency.

Whitelocke was a learned and a sound lawyer. He had hitherto shown himself not unfavourable to reform, having supported the bill introducing the calendar, having drafted a new treason law, and set on foot some alterations in chancery procedure. A tract advocating the registering of title-deeds is attributed to him. But he opposed the revolutionary innovations dictated by ignorant and popular prejudices. He defeated the strange bill which sought to exclude lawyers from parliament; and to the sweeping and ill-considered changes in the court of chancery proposed by Cromwell and the council he offered an unbending and honourable resistance, being dismissed in consequence, together with his colleague Widdrington, from the court of chancery in July 1654. Whitelocke's views towards Cromwell towards the Great Seal (see Lenthiall, William). He still, however, remained on good terms with Cromwell, by whom he was respected; he took part in public business, acted as Cromwell's adviser on foreign affairs, negotiated the treaty with Sweden of 1656, and, elected again to the parliament of the same year as member for Buckinghamshire, was chairman of the committee which conferred with Cromwell on the subject of the Petition and Advice and urged the protector to assume the title of king. In December 1657 he became a member of the new House of Lords. On Richard Cromwell's accession he was reappointed a commissioner of the Great Seal, and had considerable influence during the former's short tenure of power. He returned to his place in the Long Parliament on its recall, was appointed a member of the council of state on the 14th of May 1659, and became president in August; and subsequently, on the fresh expulsion of the Long Parliament, he was included in the committee of safety which superseded the council. He again received the Great Seal into his keeping on the 1st of November. During the period which immediately preceded the Restoration he endeavoured to oppose Monk's schemes, and desired Fleetwood to forestall him and make terms with Charles, but in vain.

On the failure of his plans he retired to the country and awaited events. Whitelocke's career, however, had been marked by moderation and good sense throughout. The necessity of carrying on the government of the country somehow or other had been the chief motive of his adherence to Cromwell rather than any sympathy for a republic or a military dictatorship, and his advice to Cromwell to accept the title of king was doubtless rendered with the object of giving the administration greater stability and of protecting its adherents under the Statute of Henry VII. Nor had he shown himself unduly ambitious or self-seeking in the pursuit of office, and he had proved himself ready to sacrifice high place to the claims of professional honour and duty. These considerations were not without weight with his contemporaries at the Restoration. Accordingly Whitelocke was not excepted from the Act of Indemnity, and after the
payment of various sums to the king and others he was allowed to retain the bulk of his property. He lived henceforth in seclusion at Chilton in Wiltshire, dying on the 28th of July 1675.

Whitehlocke married (1) Rebecca, daughter of Thomas Bennet, (2) Frances, daughter of Lord Willoughby of Parham, and (3) Mary Carleton, widow of Rowland. His eldest daughter Ellen, his second wife's daughter, was the author of Memoirs of the English affairs from the beginning of the reign of Charles I.,. published 1682 and reprinted, a work which has obtained greater authority than it deserves being largely compiled from various writers, composed after the events and abounding in errors. His work of greatest value, his Annals, still remains in MS. in Lord Buttes's and Lord de la Coste's collections (Hist. Brit. Comm. III. Rep. pp. 202, 217; also Egerton MSS. 4992, 4994); his Journal of the Swedish Embassy was published 1772 and re-edited by Henry Reeve in 1885 (add. MSS. 4902, 4991 and 4993 and Hist. MSS. Comm. III. Rep. pp. 217; Notes on the King's Writ for choosing Members of Parliament... were published 1796 (see also add. MSS. 4993); Memoirs of English Affairs from the supposed expedition of Bruce to this Island to the end of the Reign of James I., were published 1799; Essays Ecclesiastical and Civil (1706); Quench not the Spirit... (1711); some theological treatises remain in MS., and several others are attributed to him.

WHITE MOUNTAINS, the portion of the Appalachian Mountain system which traverses New Hampshire, U.S.A., between the Androscoggin and Upper Ammonoosuc rivers on the north and the lake country on the south. They cover an area of about 1300 sq. m., are composed of somewhat homogeneous granite rocks, and represent the remnants of long-continued erosion of a range which has been in part cut deep by rivers and streams they rise to rounded summits often noble in outline and of greater elevation than elsewhere in the Appalachian system, except in North Carolina, and culminate in Mount Washington, 6293 ft. above the sea. Thirteen other summits have an elevation exceeding 5000 ft. The scenery is so beautiful and varied that the region has long been popular as a summer resort. It is traversed by railways, one of which ascends Mount Washington, and contains numerous villages and fine hotels.

See the article NEW HAMPSHIRE; the Guidebook (Part i., Boston, 1907) published by the Appalachian Mountain Club; and Appalachia (ibid., 1876 seq.), a periodical published by the same club.

WHITE PLAINS, a village and the county-seat of Westchester county, New York, U.S.A., about 12 m. N. of New York City on the Bronx river, about midway between the Hudson river and Long Island Sound. Pop. (1890) 4508; (1900) 7890, of whom 1679 were foreign-born and 269 were negroes; (1910 census) 26,425. The village is served by the New York Central & Hudson River railway, and is connected by electric lines with New York City, and with Yonkers, Mount Vernon, New Rochelle, Tarrytown and Mamaroneck. White Plains is a beautiful residential suburb stretching over a considerable area of rolling tree-clad hills and picturesque stretches of meadow lands in the valley of the Bronx and Mamaroneck rivers. Near the village are Silver, Kensico and Rye lakes. Among the public buildings and the institutions here are a fine Public Library building, a town hall, an armory, the Westchester county court house and county jail, several private schools, the White Plains Hospital, St Agnes Hospital, the Presbyterian Convalescents' Sanitarium, the New York Orthopaedic Hospital, Muldoon's Hygienic Institute and Bloomingdale Hospital for the Insane (1821). In White Plains are the grounds of the Century Country Club, the Knollwood Golf and Country Club and the Westchester County Fair Association. There are some prosperous farms and market gardens.

When the Dutch first settled Manhattan, the central portion of what is now Westchester county was the granary for part of the Mahican tribe; it was called Quarropas by the Indians. To the early traders here the region was known as "the White Plains" from the groves of white balsam which covered it. The first organized settlement (November 1685) was by a party of Connecticut Puritans, who had settled at Rye in what was disputed territory between New York and Connecticut; they moved westward in a body and took up lands the title to which they bought from the Indians. The heirs of John Richill claimed that White Plains was comprised in a tract extending N. from the Mamaroneck river granted to him by the Dutch and confirmed by the English, and the controversy between these heirs and the settlers from Rye was only settled in 1728 by the grant to Lord Shud and and between other settlers of a royal patent, under which the freeholders chose their local officers and managed their own affairs. In 1759 White Plains succeeded Westchester as the county-seat of Westchester county. In the early summer of 1776 the Third Provincial Congress, having adjourned from New York City, met here in the old court house on South Broadway—the site is now occupied by an armory and is marked by a monument (1910). From the steps of this building the Declaration of Independence, brought from Philadelphia, was officially read for the first time in New York on the 11th of July 1776. Here Congress adopted formally the name "Convention of Representatives of the State of New York," and from this date the existence of New York as a state. After the British under Lord Howe had effected a landing at Throg's Neck on Long Island Sound, Washington withdrew (October) all his forces from the North end of Manhattan Island except the garrison of Fort Washington, and (21st October) concentrated his army near White Plains. His right rested on the Bronx river here, and there was a small force in rude earthworks on Chatterton's Hill on the W. bank. This point Howe attacked (October 28th), his troops advancing in two columns 4000 strong, the British under General Alexander and the Hessians under Colonel Johann Gottlieb Rall. General Alexander McDougall, in command of the American right wing, reinforced the troops on the hill, making the number of the defenders about 1600. The attack was stubbornly resisted for some time, after which the Americans retreated in good order across the river. The British had sustained such a severe loss (about 250) that no attempt was made to follow the Americans, who carried their dead and wounded, some 125 in number, away with them. Washington's forces retired three days later to North Castle township, where they occupied a strong position. The small but fine House, which still stands in North White Plains, was occupied at intervals by Washington as his headquarters before the battle and again in the summer of 1778. In 1779 a Continental force under Aaron Burr was stationed here for some months, and in 1781 (July) White Plains was occupied by parts of Launzn's and Rochambeau's French force. In 1866 White Plains received a village charter, which it still retains in spite of its large population.

See F. Shennard and W. W. Spooner, History of Westchester County (N.Y., 1890), and J. T. Scharl, History of Westchester County (2 vols., Ibid., 1886).

WHITE Sides, JAMES (1804–1876), Irish judge, son of William Whiteside, a clergyman of the Church of Ireland, was born on the 12th of August 1804, and was educated at Trinity College, Dublin, being called to the Irish bar in 1820. He very rapidly acquired a large practice, and after taking silk in 1822 he gained a reputation for forensic oratory surpassing that of all his contemporaries, and rivalling that of his most famous predecessors of the 18th century. He defended Daniel O'Connell in the state trial of 1843, and William Smith O'Brien in 1848; and his greatest triumph was in the Yelverton case in 1861. He was elected member for Enniskillen in 1851, and in 1868 became solicitor-general for Dublin city. But in Parliament he was no less successful as a speaker than at the bar, and in 1872 was appointed solicitor-general for Ireland in the first administration of the earl of Derby, becoming attorney-general in 1878, and again in 1866. In the same year he was appointed chief justice of the Queen's Bench; and he died on the 25th of November 1876. Whiteside was a man of handsome presence, attractive personality and cultivated tastes. In 1848, after a visit to Italy, he published Italy in the Nineteenth Century; and in 1870 he collected and republished some papers contributed many years before to periodicals, under the title Early Sketches of Eminent Persons. In 1853 Whiteside married Rosetta, daughter of
WHITETHROAT—WHITGIFT

William Napier, and sister of Sir Joseph Napier (1804-1882), lord chancellor of Ireland.

WHITETHROAT, a name commonly given to two species of little birds, one of which, the Motacilla sylvia of Linnaeus and Sylvia rufa or S. cinerea of recent authors, is regarded as the type, not only of the genus Sylvia, but of the sub-family of thrushes known as Sylvidae (cf. WARBLE). It is widely spread over Great Britain, in some places tolerably common, and by its gesticulations and song rather conspicuous, it is one of those birds which have gained a familiar nickname, and "pegy whitethroat," is the anthropomorphous appellation of schoolboys and milkmaids, though it shares "nettle-creeper" and other homely names with perhaps more than one congener, while to the writers and readers of books it is by way of distinction the greater white-throat. The lesser whitethroat, Sylvia cinerea, is both in habits and plumage a much less slight bird; the predominant reddish brown of the upper surface, and especially the shading of the wing-feathers, that are so distinct of its larger congener, are wanting, and the whole plumage above is of a smoky-grey, while the bird in its movements is never obtrusive, and it rather shuns than courts observation. The nests of each of these species are very pretty works of art, finely built of bents or other plant-stalks, and usually lined with horsehair; but the sides and bottom are often so finely woven as to be like open basket-work, and the eggs, splashed, spotted or streaked with olive-brown, are frequently visible from beneath through the interstices of the fabric. This style of nest-building is so frequent in both to all the species of the genus Sylvia; they are now restricted, and in many districts has obtained for the builders the name of "hay-jack," quite without reference to the kind of bird which puts the nests together, and thus is applied to the blackcap, S. atricapilla, and the garden-warbler—this last being merely a book-name—S. salicaria (S. kortenis) of some writers. The form of these deserves mention as one of the sweetest songs of Great Britain. The name blackcap is applicable only to the cock bird, which further differs from his brown-capped mate by the purity of his ashy-grey upper plumage; but, notwithstanding the marked sexual difference in appearance, he takes on himself a considerable share of the duties of incubation. All these four birds, as a rule, leave Great Britain at the end of summer to winter in the south. Two other species, one certainly belonging to the same genus, S. oretha, and the other, S. nisoria, a somewhat aberrant form, have occurred two or three times in Great Britain. The curious Dartford warbler of English writers, Sylvia undata, is on many accounts a very interesting bird, for it is one of the few of its family that winter in England—a fact more remarkable when it is known to be migratory in common to all the parts of the continent of Europe. Its distribution in England is very local, and chiefly confined to the southern counties. It is a pretty little dark-coloured bird, which here and there may be seen on furze-grown heaths from Kent to Cornwall. For a species with wings so feebly formed it has a wide range, inhabiting nearly all the countries of the Mediterranean seaboard, from Palestine to the Strait of Gibraltar, and thence along the west coast of Europe to the English Channel; but everywhere else it seems to be very local.

This may be the most convenient place for noticing the small group of warblers belonging to the well-marked genus Hypophaes, which, though in general appearance and certain habits resembling the Phylloscopi (cf. willow Wren), would seem usually to have little to do with those birds, and are not to be applied to the same genus. They have a remarkably loud song, and in consequence are highly valued on the continent of Europe, where two species at least spend the summer. One of them, H. tertia, has occurred more than once in England, and their absence as regular visitors is to be regretted. Among the minor characteristics of this little group is an affronted by their ecyces, which are of a deeper or paler brownish pink, surrounded by black. Their notes are beautiful and sweet, combining warmth with lightness in a way that cannot be fully appreciated by any description.

(A. N.)

WHITFIELD, JOHN CLARKE (1750-1836), English organist and composer, was born at Gloucester on the 13th of December 1770, and educated at Oxford under Dr Philip Hayes. In 1789 he was appointed organist of the parish church at Ludlow. Four years later he took the degree of Mus. Bac. at Cambridge, and in 1795 he was chosen organist of Armagh cathedral, whence he removed in the same year to Dublin, with the appointments of organist and master of the children at St Patrick's cathedral and Christchurch. Driven from Ireland by the rebellion of 1798, he accepted at the post vacated at Truro by Dr Warrick, president of St John's Colleges, Cambridge, and about the same time assumed the living of Long, in addition to that of Clarke, by which he had been previously known. He took the degree of Mus. Doc. at Cambridge in 1799, and in 1810 proceeded to the same grade at Oxford. In 1820 he was elected organist and master of the choristers at Hereford cathedral; and on the death of Dr Haig he was appointed professor of music at Cambridge. Three years afterwards he resigned these appointments in consequence of an attack of paralysis. He died at Hereford, on the 22nd of February 1836.

Whitfield's compositions were very numerous. Among the best of them are four volumes of anthems, published in 1808. He also composed a great number of songs, one of which—"Bird of the Wilderness," written to some well-known verses by James Hogg, the "Ettrick Shepherd,"—attained a high degree of popularity. But the great work of his life was the publication, in a popular and eminently useful form, of the oratorios of Handel, which he was the first to present to the public with a complete pianoforte accompaniment.

WHITGIFT, JOHN (c. 1530-1604), English archbishop, was the eldest son of Henry Whitgift, merchant of Great Grimsby, Lincolnshire, where he was born, according to one account in 1530, though he was probably younger, but at all events a pupil at school in the town of his own in 1530. At an early age his education was entrusted to his uncle, Robert Whitgift, abbot of the neighbouring monastery of Wellow, by whose advice he was afterwards sent to St Anthony's school, London. In 1549 he matriculated at Queens' College, Cambridge, and in May 1550 he migrated to Pembroke Hall, where he had the master John Bradford for a tutor. In May 1553 he became a fellow of Peterhouse. Having taken orders in 1560, he became in the same year chaplain to Richard Cox, bishop of Ely, who collated him to the rectory of Teversham, Cambridgeshire. In 1563 he was appointed Lady Margaret professor of divinity at Cambridge, and his lectures gave such satisfaction to the authorities that on the 3rd of July 1566 they considerably augmented his stipend. The following year he was appointed regius professor of divinity, and also became master first of Pembroke Hall and then of Trinity. He had a principal share in compiling the statutes of the university, which passed the great seal on the 23rd of September 1570, and in November following he was chosen vice-chancellor. Macaulay's description of Whitgift as "a narrow, mean, tyrannical priest, who gained the great seat of Peter only by the ruin and misery of a whole nation," is an exaggeration; but undoubtedly Whitgift's extreme High Church notions led him to treat the Puritans with exceptional intolerance. In a pulpit controversy with Thomas Cartwright, regarding the constitutions and customs of the Church of England, he showed himself Cartwright's inferior in oratorical effectiveness, but the balance was redressed by the exercise of arbitrary authority. Whitgift, with other heads of the university, deprived Cartwright in 1570 of his professorship, and in September 1571 excommunicated him in virtue of his preaching without a master's order to deprive him of his fellowship. In June of the same year Whitgift was appointed the second bishop of Armagh; and subsecively dean of Lincoln. In the following year he published An Answer to a Certain Libel intituled an Admonition to the Parliament, which led to further controversy between the two divines. On the 24th of March 1577, Whitgift was appointed bishop of Worcester, and during the absence of Sir Henry Sidney in Ireland (1577) he acted as vice-president of Wales. In August 1583 he was appointed archbishop of Canterbury, and thus was largely instrumental in giving its special complexion to the church of the Reformation. Although he wrote a letter to Queen Elizabeth remonstrating against the alienation of church property, Whitgift always retained her special confidence. In his policy against the Puritans, and in his vigorous enforcement of the subscription test, he thoroughly carried out the queen's policy of religious uniformity. He drew up articles aimed at
nonconforming ministers, and obtained increased powers for the Court of High Commission. In 1586 he became a privy councillor. His action gave rise to the Marprelate tracts, in which the bishops and clergy were bitterly attacked. Through Whitgift’s vigilance the priests of the tracts were observed, discovered, and punished; and in order more effectually to check the publication of such opinions he got a law passed in 1593 making Puritanism an offence against the statute law. In the controversy between Walter Travers and Richard Hooker he interposed by prohibiting the preaching of the former; and he moreover presented Hooker with the rectory of Boscombe in Wiltshire, in order to afford him more leisure to complete his Ecclesiastical Polity, a work which, however, cannot be said to represent either Whitgift’s theological or his ecclesiastical standpoint. In 1595 he, in conjunction with the bishop of London and other prelates, drew up the Calvinistic instrument known as the Lambeth Articles, which were not accepted by the church. Whitgift attended Elizabeth on her deathbed, and crowned James I. He was present at the Hampton Court Conference in January 1604, and died at Lambeth on the 20th of the following February. He was buried in the church of Croydon, and his monument there with his recumbent effigy was in great part destroyed in the fire by which the church was burnt down in 1687.

Whitgift is described by his biographer, Sir G. Paule, as of “middle stature, with a well shaped, of a good countenance and bright complexion, black hair and eyes, his beard neither long nor thick.” He was noted for his hospitality, and was somewhat ostentatious in his habit and room, that the people often went out in the streets of the town by retinue of 800 horsemen. He left several unpublished works, which are included among the MSS. Anglico. Many of his letters, articles, injunctions, &c. are calendared in the published volumes of the “State Paper” series of the reign of Elizabeth. His Collected Works, edited for the Parker Society by John Acre (3 vols., Cambridge, 1821-1833), include, besides the controversial tracts already alluded to, two sermons published during his lifetime, a selection from his letters to Cecil and others, and some portions of his unpublished MSS.

A Life of Whitgift by Sir G. Paule appeared in 1611, 2nd ed. 1649. It was embodied by John Strype in his Life and Acts of Whitgift (1718). The Works is also a Life by C. Mardwicke’s Ecclesiastical Biography (1810), W. F. Hook’s Archbishops of Canterbury (1875), and vol. I. of Whitgift’s Collected Works. See also C. Cooper’s Athenea Cantabrigienses.

WHITHORN, a royal burgh of Wigtownshire, Scotland, Pop. (1901) 1118. It is situated near the southern extremity of the peninsula of Machers, 121 m. S. of Wigtown by railway. The town consists of one long street running north and south, in which the town-hall is situated. It is famous for its associations with St Ninian or Ringan, the first Christian missionary to Scotland. He landed on the island near the mouth of the river about 3½ m. to the S.E. where he built (367) a church of stone and lime, which, out of contact with the dark mud and wintry huts of the natives, was called Candida Casa, the White House (Anglo-Saxon, hwiti ærne, Whitherne or Whithorn). This he dedicated to his master St Martin of Tours. Ninian died probably in 432 and was buried in the church. A hundred years later the Magnus Monasterium, or monastery of Rosnat, was founded at Whithorn, and became a noted home of learning and, in the 8th century, the seat of the bishopric of Galloway. It was succeeded in the 11th century by St Ninian’s Priory, built for the premonstratensian monks by Fergus “Long the Way,” of which only the chancel (used as the parish church till 1822) with a richly decorated late Norman doorway, and fragments of the lady chapel, vaults, cells, buttresses and tombs remain. The priory church was the cathedral church of the see till the Reformation, when it fell into gradual decay. In Roman times Whithorn belonged to the Novantae, and William Camden, the antiquary, identified it with the Leukophila of Ptolemy. It was made a royal burgh by Robert Bruce.

WHITING, city of Lake county, Indiana, U.S.A., on the S.W. shore of Lake Michigan, 50 m. S. of Chicago. Pop. (1890) 1428; (1900) 3983 (1907 foreign-born); (1910) 6587. It is served by the Baltimore & Ohio, the Lake Shore & Michigan Southern, the Pennsylvania, the Chicago, Indiana & Southern and (for freight only) the Elgin, Joliet & Eastern, the Chicago Terminal Transfer, and the Indiana Harbour Belt railways; and is connected with Chicago and with the surrounding towns by an electric line. The city has a Carnegie library and a public park. Manual training, from the fourth to the twelfth grades, is a feature of the public school system. Whiting adjoins the cities of Hammond and East Chicago, and is practically a part of industrial Chicago, from which it is separated only by the Calumet state line. It is a shipping point; the Standard Oil Company has a large refinery here, and among its manufactures are asphaltum for street paving, linoleum and men’s garments. Whiting was first settled about 1870, was incorporated as a town in 1893, and chartered as a city in 1903.

WHITING (Gadus merlangus), a fish of the family Gadidae, which is abundant on the shores of the German Ocean and all round the coasts of the British Islands; it is distinguished from the other species of the genus by having from 33 to 35 rays in its first anal fin, and by lacking tricuspid teeth on the lower jaw. The snout is long, and the upper jaw longer than the lower. A black spot at the root of the pectoral fin is also very characteristic of this species, and but rarely absent. The whiting is one of the most valuable food fishes of northern Europe, and is caught throughout the year by hook and line, and by the trawl. It is in better condition at the beginning of winter than after the spawning season, which falls in the months of February and March. Its usual size is from 1 to 3 lb, but it may attain to twice that weight.

Whitling is a name applied loosely to any inflammation involving the pulp of the finger, attended by swelling and throbbing pain. In the simplest form, which is apt to occur in sickly children, the inflammation results in a whitish vesicle of the skin, containing watery or bloody fluid. In all such cases, where the deeper structures are not implicated, no radical local treatment is needed, although the illness is an indication for constitutional treatment. The inflammation is not usually spoken of as whitlow unless it involves the deeper structures of the last joint of the finger, in which case it is associated with intense pain. As the result of a scratch or prick of the finger septic germs enter the skin and give rise to an acute inflammation, with throbbing and burning pain. If the germs do not spread from that spot, they set up an acute localized attack of erysipelas which may end in a superficial abscess. More often, however, they make their way to the peristome of the last bone of the finger, and involve it in a devastating inflammation which may end in death (necrosis) of that bone. Sometimes the germs find their way into the tendon-sheath, and, spreading into the palm of the hand, cause a deep abscess with, perhaps, sloughing of the tendon, and leaving a permanently stiffened finger. In some cases the reaction of the disease is so intense that the hand is especially apt to occur in people who are out of health, as in them the micro-organisms of the disease meet with less resistance. So soon, therefore, as the acute stage of the disease is over, tonic treatment, with quinine and iron, is needed. The local treatment of whitlow demands a free incision into the area in which the germs are undergoing cultivation, and the sooner that this is done the better. It is wrong to wait for an abscess to be formed. A prompt incision may actually prevent the formation of abscess, and the easing of the tension of the inflamed tissue by the incision gives immediate relief. Perhaps, even in the early stage of the disease, a bead or two of pus may find exit, but whether there is abscess or not, the depths of the wound should be swabbed out with some strong carabolic or mercuric lotion in order to destroy the germs. The hand should then be placed upon a splint with antiseptic fomentations around the finger. It should, moreover, be kept well raised, or worn in a sling.

WHITMAN, MARCUS (1802-1847), American missionary and pioneer, was born at Rushville, New York, on the 4th of September 1802. He studied medicine at Pittsfield, Massachusetts, and practised in Canada and in Wheeler, Steuben county, New York. In 1834 he was accepted by the American Board of Commissioners for Foreign Missions for missionary work among the American Indians, and was assigned to the Oregon territory, then under the joint occupation of Great Britain and the United States. He set out early in 1835, but returned almost immediately
to secure other workers. In February 1836 he married and in March again crossed the continent, accompanied by his wife, Rev. and Mrs H. H. Spalding and W. H. Gray, and settled at Wallatpu, near the present Walla Walla, Washington. Dis- 
sensions which arose among the missionaries and their apparent lack of success led to a resolution (February 1834) of the Prudential Committee of the Board to abandon the southern station. With the consent of his associates, Dr Whitman started from the station (3rd October 1842) on the perilous winter journey over the Rocky Mountains and across the plains for the missionary headquarters at Boston, to urge the revival of the order. He visited New York and Washington also to enlist help and sympathy. On his return journey he joined a considerable body of emigrants on their way to Oregon and piloted them across the mountains. The mission, however, gained the ill-will of the Indians, and, on the 26th of October 1847 Dr and Mrs Whitman and twelve others were killed, and the station was broken up.

On the 15th of November 1864 the statement was published, on the authority of Mr Spalding, that the purpose of Dr Whitman's ride, twenty-two years before, was to prevent the cession of the territory to Great Britain. The story was amplified by Spalding and Gray in 1865 and in its English version, and in its French version, learned at the British fort Walla Walla in September 1842 that a large number of British settlers were expected, and that it was hoped that the treaty then supposed to be signed by Governor Louisa was to be sanctioned by Daniel Webster, Secretary of State, would give the territory to the British. Thereupon Whitman made his way to Washington, and with much difficulty convinced Webster and President Polk of the error of the treaty. The story was published for the first time in the London Times, and the exchange for fishing privileges off Newfoundland. This story has been widely disseminated, but Professor E. G. Bourne and Mr W. J. Marshall independently investigated the whole question, and showed that there is no evidence that Dr Whitman influenced or attempted to influence the State Department. For the pro-Whitman side, see W. H. Gray, Oregon (Portland, 1870); William Barrows, Oregon (Boston, 1889); O. W. Nixon, New Marcus Whiteman saved Oregon (Chicago, 1892); W. A. Mowry, Marcus Whiteman (New York, 1901); Myron Eells, Marcus Whiteman (Seattle, 1909). On the other side see H. H. Bancroft, Oregon (San Francisco, 1886-1888); E. G. Bourne, Essays in Historical Criticism (New York, 1901); W. J. Marshall, History v. The Whitman-saved-Oregon Story (Chicago, 1904).

WHITMAN, WALT (1819-1892), American poet, was born at West Hills, on Long Island, New York, on the 31st of May 1819. His ancestry was mingled English and Holland Dutch, and had flourished upon Long Island more than 150 years—long enough to have taken deep root in the soil and to have developed, in its farmers and seafaring men, many strong family traits. His father, Walter Whitman, was a farmer and carpenter; his mother, Louisa Van Velsor, was the granddaughter of a sea captain. There do not appear to be any men in his line of descent who have ever striven, in any way, or even agreed, to come back to the 17th century, when we come to Abijah Whitman, a clergyman, settled in Connecticut. Later this Abijah moved to Long Island, and from him all the Whitmans on the island descended. Walt was the second of a family of nine children. The parents early moved to Brooklyn, where Whitman spent his youth. His career was a chequered one, like that of so many other self-made American men. First he was an errand boy in a lawyer's office; then he was employed in a printing office; next he became a country school teacher; he founded (1836) and still edits the Oregonian at Portland, Oregon, and later edited a daily paper in Brooklyn (the Eagle, 1846-1847); then he was found in New Orleans, on the editorial staff of the Crescent (1843-1849); afterwards he passed his time carpentering, building and selling small houses in Brooklyn (1851-1854), in the meanwhile writing for the magazines and reviews and turning out several novels, and finally revolving in his mind the scheme of his Leaves of Grass. This scheme was probably gestating in his mind during the years 1833, 1854 and 1855. He frequently stopped his carpentering to work at his poems. He was a prolific manuscript writer, showing the preparatory studies and reflections that preceded the Leaves; many of them, under the title of Notes and Fragments, were privately printed by his literary executor, Dr Richard Maurice Bucke, in 1899. Finally, in the summer of 1855 the first edition of Leaves of Grass appeared—a small quarto of ninety-four pages. The book did not attract the attention of the critics and the reading public till a letter from Emerson to the poet, in which the volume was characterized as "the most extraordinary piece of wit and wisdom that America has yet contributed," was published in the New York Tribune. This created a demand for the book, and started it upon a career that has probably had more vicissi- tudines than any other. The publisher was more prone to hostile criticism than any other contemporary literary work. In 1856 a second and much enlarged edition of Leaves of Grass appeared. In 1860 a third edition, with much new matter, was published in Boston. In 1862 Whitman went to Washington to look after his brother, Lieutenant-Colonel George W. Whitman, who was wounded at the battle of Fredericksburg. Henceforth, for more than ten years he remained in and about Washington, acting as a volunteer nurse in the army hospitals as long as the war lasted, and longer, and then finding employment as a clerk in the government departments, in the meantime devoting himself to and revising his Leaves and publishing two or three editions of himself, his own publisher and bookseller. Out of his war experiences came in 1866 his Drum Taps, subsequently incorporated into the main volume. Early in 1873 he suffered a paralytic stroke which partially disabled him. He then went to Camden, New Jersey, to live and continued to reside in that city till his death on the 27th of March 1892. In 1877 appeared his prose volume called Democratic Vistas. In 1876 he published a thin volume, called Two Rivedals, made up of prose and verse. Specimen Days and Collect, also prose, appeared in 1883. New editions of his Leaves appeared, and his life was ordered to appear as he lived. A final and complete edition of his works, including both prose and verse, was published in Philadelphia in 1889.

Whitman never married, never left America, never laid up, or aimed to lay up, riches: he gave his time and his substance freely to others, belonged to no club nor coterie, associated habitually with the common people—mechanics, coach-drivers, working men of all kinds—was always cheerful and optimistic. He was large and picturesque of figure, slow of movement, tolerant, receptive, democratic and full of charity and goodwill. He never goes into criticism or arguments at all; makes it in fact his great task to deal with the human, the individual, the indefinibles, characteristics, rivers, states, persons, &c. Be full of

strong sensual germ, ... Poet! beware lest your poems are made in the spirit that comes from the study of pictures of things—and not from the spirit that comes from the contact with real things themselves." The mother-idea of his poems, he says, is democracy, and democracy "carried far beyond politics into the region of taste, the standards of manners and beauty, and even into philosophy and theology." His Leaves certainly radiates democracy as no other modern literary work. He makes it a rule to make his work the "hallmark of natural, liberal, indig-
WHITNEY, E.—WHITNEY, W. D.

(Boston, 1904) edited by W. S. Kennedy; In re Wall Whitney (Philadelphia, 1893) edited by his literary executors, H. L. Trubel, R. M. Bucke, T. B. Harned; Horace Trubel, Wall Whitney in Camden (Boston, 1907), a recollection of studies by Bliss Perry, Wall Whitney: His Life and Work (Boston, 1907), with new material and unpublished letters; Cadamus, a series of letters (1866); Wall Whitney, a young friend" (Peter Doyle), edited by R. M. Bucke (1897), who also wrote an autobiography—Wall Whitney (Philadelphia, 1885)—which contains contemporary criticisms of Whitman and W. D. O'Connor's "Good Gray Poet" (1866); Wall Whitney (London, 1893), a study by J. Addington Symonds; Reminiscences of Wall Whitney with Extracts from his Letters (London, 1896) by W. S. Kennedy; H. B. Binns, Life of Wall Whitney (New York, 1906); and critical studies by R. H. Stevenson's Familiar Letters, by S. S. Seaton, and E. Dowden's Studies in Literature (1892), and in E. C. Stedman's Poems of America, etc. A bibliography of writings on Whitman is appended to Selections (Boston, 1909), edited by O. L. Triggs.

WHITNEY, ELI (1765-1825), American inventor, was born on a farm in Westboro, Massachusetts, on the 8th of December 1765. He exhibited unusual mechanical ability at an early age and earned a considerable part of his expenses at Yale College, where he graduated in 1792. He soon went to Savannah, Georgia, expecting to secure a position as a teacher, but was disappointed, and accepted the invitation of Mrs Nathaniel Greene, the widow of the Revolutionary general, to spend some time on her plantation on the Savannah river, while deciding upon his future course. The construction of several ingenious household contrivances led Mrs Greene to introduce to some gentlemen who were discussing the desirability of a machine to separate the short staple upland cotton from its seeds, work which was then done by hand at the rate of a pound of lint a day.

In a few weeks Whitney produced a model, consisting of a wooden cylinder encircled by rows of slender spikes set half an inch apart, which extended between the bars of a grid so closely together that the seeds could not pass, but the lint was pulled through by the revolving spikes; a revolving brush cleaned the spikes, and the lint was removed from the cotton. The machine was worked by hand and could clean 50 lb of lint a day. The model seems to have been stolen, but another was constructed and a patent was granted on the 14th of March 1794. Meanwhile Whitney had formed a partnership with Phineas Miller (who afterward married Mrs Greene), and they built at New Haven, Connecticut, a factory (burned in March 1795) for the manufacture of the gins. The partners intended to establish an absolute monopoly and to charge a toll of one-third of the cotton or to buy the whole crop. They were unable to supply the demand, and inaccuracy blacksmiths constructed many machines. A patent, later annually renewed, was granted (May 13, 1795) to Hodgen Holmes for a gin which substituted circular saws for the spikes. Whitney spent much time and money prosecuting infringements of his patent, and in 1807 its validity was finally settled. The financial returns in Georgia cannot be ascertained. The legislature of South Carolina voted $50,000 for the rights for that state, while North Carolina levied a license tax for five years, from which about $30,000 was realized. Tennessee paid, perhaps, $10,000. Meanwhile Whitney, disgusted with the struggle, began the manufacture of fire-arms near New Haven (1795) and secured profitable government contracts. He introduced this factory division of labour and standardized parts. Although the modern gin has been much enlarged and improved, the essential features are the same as in Whitney's first model, and the invention profoundly influenced American industrial, economic and social history.

WHITNEY, JOSIAH DWIGHT (1820-1890), American geologist, was born at Northampton, Massachusetts, on the 23rd of November 1820. He graduated at Yale in 1839, and after two years' work as assistant in the geological survey of New Hampshire, spent three years in Europe studying chemistry, mineralogy and geology. Returning to the United States in 1847, he laboured successfully for a time in the copper and iron lands of the Lake Superior region; in 1855 he became State chemist and professor in the Iowa University and took part in the geological survey of the state; he subsequently worked in the lead region of the upper Missouri river, in Wisconsin, and in Illinois, publishing many reports, singly or in collaboration with others. From 1860 to 1874 he was state geologist of California, and issued a comprehensive series of reports on its topography, geology and botany. In 1869, with William H. Brewer, he determined the heights of the principal Rocky Mountain summits; and in recognition of his labours Mount Whitney (5,402 ft. in elevation), the highest peak in the United States) received its name from him. After his death he was professor of geology and director of the school of mining and practical geology at Harvard University, residing in Cambridge save when absent on expeditions of research. The records of his investigations are somewhat dispersed; the most homogeneous of his writings are The Metallic Wealth of the United States, described and compared with that of other Countries (1854), a work of importance at the time of its issue, and Contributions to American Geology (vol. i. only, 1886). He died at Lincoln, New Hampshire, on the 28th of August 1866.

WHITNEY, WILLIAM COLLINS (1842-1904), American political leader and financier, was born at Conway, Massachusetts, on the 15th of July 1841, of Puritan stock. He graduated at Yale in 1863, studied law at Harvard, and practised with success in New York City. He was an aggressive opponent of the "Tweed Ring," and was actively allied with the anti-Tammany organizations, the "Irving Hall Democracy" of 1875-1890, and the "County Democracy" of 1880-1860, but upon the dissolution of the latter he became identified with Tammany. In 1875-1878 he was corporation counsel of New York, and as such brought about a codification of the laws relating to the city, and successfully contested a large part of certain claims, largely fraudulent, against the city, amounting to about $20,000,000, and a heritage from the Tweed regime. During President Cleveland's first administration (1885-1888), Whitney was secretary of the navy department and did much to develop the navy, especially by encouraging the domestic manufacture of armour plate. In 1892 he was instrumental in bringing about the third nomination of Mr Cleveland, and took an influential part in the ensuing presidential campaign; but in 1896, disgruntled by the "free-silver" legislation, he refused to support his party's candidate, Mr J. W. Bryan. Whitney took an active interest in the development of urban transit in New York, and was one of the organizers of the Metropolitan Street Railway Company. He was also interested in horse-racing, and in 1901 won the English Derby with Volodyovski, leased by him from Lady Meux. He died in New York City on the 2nd of February 1904.

WHITNEY, WILLIAM DWIGHT (1827-1894). American philologist, was born at Northampton, Massachusetts, on the 9th of February 1827. He was the fourth child and the second surviving son of Josiah Dwight Whitney, a banker, and Sarah Williston, daughter of the Rev. Payson Williston (1763-1836) of Easthampton, Mass., and a sister of Samuel Williston (1795-1874), founder of Williston Seminary at Easthampton. Through both parents he was descended from New England stock remarkable alike for physical and mental vigour; and he inherited all the social and intellectual advantages that were afforded by a community noted, in the history of New England, for the large number of distinguished men whom it produced. At the age of fifteen (1842) he entered the sophomore class at Harvard (at Williams-town, Mass.), where he graduated three years later with the highest honours. His attention was at first directed to natural science, and his interest in it always remained keen, and his knowledge of its principles and methods exerted a noticeable influence upon his philological work. In the summer of 1870 he had charge of the botany, the barometrical observations and the accounts of the United States survey of the Lake Superior region conducted by his brother, Josiah D. Whitney, and in the summer of 1873 assisted in the geographical work of the Hayden expedition in Colorado. His interest in the study of Sanskrit
was first awakened in 1848, and he at once devoted himself with enthusiasm to this at that time little-explored field of philological labour. After a brief course at Yale with Professor Edward Hitchcock (1814-1860), then the only trained Orientalist in the United States, Whitney went to Germany (1850) and studied for three years at Berlin, under Weber, Bopp and Lepsius, and at Tübingen (two summer semesters) under Roth, returning to the United States in 1853. In the following year he was appointed professor of Sanskrit in Yale, and in 1859 also of comparative philology. He also gave instruction in French and German in the college until 1867, and in the Sheffield scientific school until 1886. An urgent call to a professorship at Harvard was declined in 1866, on the ground of the importance of his work at Yale. He was early and widely recognized. He was elected to membership in numerous learned societies in all parts of the world, and received many honorary degrees, the most notable testimonial to his fame being his election on the 31st of May 1881, as foreign knight of the Prussian order pour le mérite for science and art to fill the vacancy caused by the death of Carlyle. In 1870 he received from the Berlin Academy of Sciences the first Bopp prize for the most important contribution to Sanskrit philology during the preceding three years—his edition of the Tālikāṭi-Prātiḥṣākhya (Journal of the American Oriental Society, vol. i.). He died at New Haven, Connecticut, on the 27th of June 1894.

As a philologist Whitney is especially noted for his work in Sanskrit, which placed him among the first scholars of his time. He edited (1855-1856), with Professor Roth, the Atharva-Veda-Sanhāta; published (1862) with a translation and notes the Atharva-Veda-Prātiḥṣākhya; made important contributions to the great Petersburg lexicom; issued an index verborum to the published text of the Atharva-Veda (Journal of the American Oriental Society, 1881); made a translation of the Atharva-Veda, books i.-ix., with a critical commentary, which he did not live to publish (edited by Lanman, 1905); and published a large number of special articles upon various points of Sanskrit philology. His most notable achievement in this field, however, is his Sanskrit Grammar (1879), a work which, as, Professor Delbrück has said, not only is "the best text-book of Sanskrit which we possess," but also places its author, as a scientific grammarian, on the same level with such writers as Madvig and Krüger. To the general public Whitney is best known through his works on the history and development of literature and languages as a lexicographer. The former are, perhaps, the most widely read of all English books on the subject, and have merited their popularity through the soundness of the views which they present and the lucidity of their style.¹ His most important service to lexicography was his guidance, as editor-in-chief, of the work on The Century Dictionary (1889-1891). Apart from the permanent value of his contributions to philology, Whitney is notable for the great and stimulating influence which he exerted throughout his life upon the development of American scholarship.

The chronological bibliography of Whitney's writings appended to vol. xix. (first half) of the Journal of the American Oriental Society, issued in May 1897, contains 360 numbers. Of these the most important, in addition to those mentioned above, are: Translation of the Jātaka-Stātbhānta, a Text-book of Hindu Astronomy (Jour. Am. Oriental Soc., vol. vi., 1860); Language and the Study of Language (1867); A Compendious German Grammar (1869); Oriental and Linguistic Studies (1873; second series, 1874); The Life and Growth of Language (1875); Essentials of English Grammar (1877); A Compendious German and English Dictionary (1877); A Practical French Grammar (1886); Max Müller and the Science of Language (1887); Die Vorzeit (1889); What is Religion (1891); Der B. E. (1894); and, above all, The History of Religion in the World, the second edition of which (1898) contains a large amount of new matter.

WHITSTABLE, a watering-place in the St. Augustine's parlia-

motional division of Kent, England, on the north coast at the end of the Swale, 6 m. N.N.W. of Canterbury, on the South Eastern & Chatham railway. Pop. of urban district (1901), 7,086.

¹ They are particularly important in that they counteracted the popular and interestingly written books of Max Müller; for instance, Max Müller and Wilhelm von Humboldt were in an innate faculty and Whitney considered it the product of experience and outward circumstance. See Whitney's article Philology in the present edition of the Encyclopaedia Britannica.

The branch railway connecting Whitstable with Canterbury was one of the earliest in England, opened in 1830. The church of All Saints (Decorated and Perpendicular) possesses some valuable painted walls; it was restored in 1875. Whitstable has been famous for its oyster beds from time immemorial. The fisheries were held by the Incorporated Company of Dredgers (incorporated by Act of Parliament in 1793), the affairs being administered by a foreman, deputy foreman and jury of twelve; but in 1896 an Act of Parliament transferred the management of the fishery to a company. The less extensive Seasalter and Ham oyster fishery adjoins. There is also a considerable coasting trade in coal in conjunction with the South-Eastern & Chatham railway company, who are the owners of the harbour, which accommodates vessels of about 400 tons alongside the quay. The urban district consists of parts of the old parishes of Whitstable and Seasalter. In modern times the manor was held by Wynne Ellis (1706-1875), who left a valuable collection of paintings to the nation.

Tankerton, adjoining Whitstable to the N.E., is a newly established seaside resort.

WHITSUNDAY, or PENTECOST (Lat. Pentecoste, Gr. πεντηκοστήν, sc. ἡμέρα, Fr. Pentecôte, Osc. Pfingsten, ir. O. H. G. feimch(adust)). The twophrases are connected in the name of the Christian Church, celebrated on the fiftieth (sunday-thirty) day after Easter, commemorating the descent of the Holy Spirit on the disciples. The day became one of the three baptismal feasts, and the name Whitsunday is now generally attributed to the white garments formerly worn by the candidates for baptism on this feast, as in the case of the Dominica in albis. The festival is the third in importance of the great feasts of the Church and the last of the annual cycle commemorating the Lord. It is connected with the Jewish Pentecost (q.e.), not only in the historical date of its origin (see Easter), but in its connexion with the Christian observance of the first-fruits of the earth, the Christian for the first-fruits of the Spirit. In the early Church the name of Pentecost was given to the whole fifty days between Easter and Whitsunday, which were celebrated as a period of rejoicing (Tertullian, De idolea, c. 12, De bat. 19, De cor. mill. 3, A pos. Canons, c. 37, Canons of Antioch, 30). In the narrower sense, as the designation of the fiftieth day of this period, the word Pentecost occurs for the first time in a canon of the council of Elvira (305), which denounces as an heretical abuse the tendency to celebrate the day five days later instead of the a week after Easter in imitation of the Jewish observance of Sukkoth. There is plentiful evidence that the festival was regarded very early as one of the great feasts; Gregory Nazianzen (Orat. xlviv. De Pentec. cale it on the "day of the Spirit" (ἐμπνεύσεως, and in 385 the Peregriatio Silvae (see Duchesne, Origines, App.) describes its elaborate celebration at Jerusalem. The code of Theodosius (xv. 5, De spectaculis) forbade theatrical performances and the games of the circus during the feast. The custom of hallowing the days immediately surrounding the festival is comparatively late. Thus, among others, the synod of Mainz in 813 ordered the celebration of an octave similar to that at Easter. The custom of celebrating the vigil by fasting had already been introduced. The duration of the festival was however, ultimately fixed at three days. In the Church of England this is still the rule (there are special collects, gospels and epistles for Monday and Tuesday in Whitsun week); in the Lutheran churches two days only are observed.

In the middle ages the Whitsun services were marked by many curious customs. Among these described by Durandus (Rationale, 11.107) were the環ing down of a dove from the roof into the church, the dropping of balls of fire, rose-leaves and the like. Whitsun is one of the Scottish quarter-days, and though the Church festival is movable, the legal date was fixed for the 15th of May by an act of 1693. Whitsunday, which, with the Sunday itself, was the occasion for the greatest of all the medieval church fairs, was made an English Bank Holiday by an act passed on the 25th of May 1871.

Redencylklopàdie (1904), xv, 254, s.v. "Zingsten." For the many superstitions and observances of the day see P. H. Ditchfield, Folk-lore in America, Brand, Antiquities of Great Britain (Hazzitt's ed., 1906); B. Picart, Cérémonies et coutumes religieuses de tous les peuples (1723).

WHITTIER, JOHN GREENLEAF (1807-1892). America's "Quaker poet" of freedom, faith, and the sentiment of the common people, was born in a Merrimack Valley household, Haverhill, Massachusetts, on the 17th of December 1807. The dwelling was built in the 17th century by his ancestor, the sturdy immigrant, Thomas Whittier, notable through his efforts to secure toleration for the disciples of George Fox in New England. Thomas's son Joseph joined the Society of Friends and bore his share of obloquy. Successive generations obeyed the monitions of the Inner Light. The poet was born in the faith, and adhered to its liberalized tenets, its garb and speech, throughout his lifetime. His father, John, was a farmer of limited means but independent spirit. His mother, Abigail Hussey, whom the poet strongly resembled, was of good stock. The Rev. Stephen Bachiler, an Oxford man and a Churchman, who became a Nonconformist and emigrated to Boston in 1632, was one of her forebears and also an ancestor of Daniel Webster. The poet and the statesman showed their kinship by the "dark, deep-set and lustrous eyes" that impressed one who met either of these uncommon men. The former's name of Greenleaf is thought to be derived from the French Feuillevert, and to be of Huguenot origin; and there was Huguenot blood as well in Thomas Whittier, the settler. The poet thus fairly inherited his conscientious religious heredity and temperament. As it was, he never went farther than the legislature of his own state (1835-1836), elected by his neighbours in an anti-slavery town. But if Garrison, Phillips and Sumner and Mrs Stowe were to be the rhapsodists of the long emancipation struggle, Whittier was its forerunning poet-seer. In 1833 he had issued at his own cost a pamphlet, "Justice and Expediency," that provoked vehement discussion North and South. Later he shared with the agitators their experience of lawlessness, mob-violence and political odium. His sister Elizabeth, who became his life companion, and whose verse is preserved with his, was president of the Women's Anti-Slavery Society in Amherst. It is to be noted that the first collection of Whittier's lyrics was the Poems written during the Progress of the Abolition Question in the United States, issued by a friend in 1837. But Mogg Megone (1836) was his first book, a crude attempt to apply the manner of Scott's romantic cantos to a native theme. Among his other lyrical volumes, of dates earlier than the Civil War, were Lays of my Home (1843), Voices of Freedom (1848), Songs of Labor (1850), The Chapel of the Hermit (1853), The Panorama (1856), Home Ballads (1856). The titles of In War Time (1863) and National Lyrics (1865) rightly designate the patriotic rather than Romantic contents of these books. The poet was closely affiliated with the Atlantic Monthly from the foundation of that classic magazine in 1857. His repute became national with the welcome awarded to Snow-Bound in 1866, and brought a corresponding material reward. Of his later books of verse may be mentioned The Tent on the Beach (1867), The Pennsylvania Pilgrim (1872), The Vision of Echard (1878), The King's Missive (1881), At Sundown, his last poems (1890). As early as 1849 an illustrated collection of his poems appeared, and his Poetical Works was issued in London in 1850. During the remainder of his life, no less than ten successive collections of his poems appeared. Meanwhile he did much editing and compiling, and produced, among other works in prose, The Stranger in Lowell (1845), Supernaturalism in New England (1847), Leaves from Margaret Smith's Journal (1839), a pleasing treatement in old-style English of an early Colonial theme. When he died, in 1892, in New Hampshire, among the hills he loved and sang so well, he had been an active writer for over sixty years, leaving more than that number of publications that bore his name as author or editor. His body was brought to Amherst for interment: the funeral services were held in the open air, and conducted after the simple rites of the Friends, in the presence of a large concourse, certain of whom "spake as they were sustained until forced by ill-health, early in his twenty-fifth year, to re-seek the Haverhill farm. There he remained from 1832 to 1836, when the property was sold, and the Whittiers removed to Amherst in order to be near their meeting-house and to enable the poet to be in touch with affairs. The new home became, as it proved, that of his whole after-life; a dwelling then bought and in time remodelled was the poet's residence for fifty-six years, and from it, after his death on the 7th of September 1892, his remains were borne to the Amherst graveyard.

While in Hartford Whittier issued in prose and verse his first book, Legends of New England (1831), and edited the writings of the poet John Gardiner C. Brainard. Thenceforward he was constantly printing verse, but of the hundred or more pieces composed before his settlement at Amherst less than fifty are retained in his final collection. Of these none has more significance than the poem to Garrison, which appeared in 1831, and was read (December 1833) at the Philadelphia Convention that formed the Anti-Slavery Society. To that convention, with one-third of its membership composed of Friends, Whittier was a delegate, and was appointed one of the committee that drafted the famous Declaration of Sentiments. Although a Quaker, he had a polemical spirit; men seeing Whittier only in his saintly age knew little of the fire wherewith, setting aside ambition and even love, he maintained his warfare against the "national crime," employing action, argument and lyric scorn. A future was open for him among the Protectionists, who formed the Whig party, and doubtless soon would have carried him to the United States Convention. Whittier had no farther than the legislature of his own state (1835-1836), elected by his neighbours in an anti-slavery town. But if Garrison, Phillips and Sumner and Mrs Stowe were to be the rhapsodists of the long emancipation struggle, Whittier was its forerounding poet-seer. In 1833 he had issued at his own cost a pamphlet, "Justice and Expediency," that provoked vehement discussion North and South. Later he shared with the agitators their experience of lawlessness, mob-violence and political odium. His sister Elizabeth, who became his life companion, and whose verse is preserved with his, was president of the Women's Anti-Slavery Society in Amherst. It is to be noted that the first collection of Whittier's lyrics was the Poems written during the Progress of the Abolition Question in the United States, issued by a friend in 1837. But Mogg Megone (1836) was his first book, a crude attempt to apply the manner of Scott's romantic cantos to a native theme. Among his other lyrical volumes, of dates earlier than the Civil War, were Lays of my Home (1843), Voices of Freedom (1848), Songs of Labor (1850), The Chapel of the Hermit (1853), The Panorama (1856), Home Ballads (1856). The titles of In War Time (1863) and National Lyrics (1865) rightly designate the patriotic rather than Romantic contents of these books. The poet was closely affiliated with the Atlantic Monthly from the foundation of that classic magazine in 1857. His repute became national with the welcome awarded to Snow-Bound in 1866, and brought a corresponding material reward. Of his later books of verse may be mentioned The Tent on the Beach (1867), The Pennsylvania Pilgrim (1872), The Vision of Echard (1878), The King's Missive (1881), At Sundown, his last poems (1890). As early as 1849 an illustrated collection of his poems appeared, and his Poetical Works was issued in London in 1850. During the remainder of his life, no less than ten successive collections of his poems appeared. Meanwhile he did much editing and compiling, and produced, among other works in prose, The Stranger in Lowell (1845), Supernaturalism in New England (1847), Leaves from Margaret Smith's Journal (1839), a pleasing treatment in old-style English of an early Colonial theme. When he died, in 1892, in New Hampshire, among the hills he loved and sang so well, he had been an active writer for over sixty years, leaving more than that number of publications that bore his name as author or editor. His body was brought to Amherst for interment: the funeral services were held in the open air, and conducted after the simple rites of the Friends, in the presence of a large concourse, certain of whom "spake as they were
moved " in tribute to the bard. The Amesbury house has been acquired by the "Whittier Home Association," so that the building and grounds are guarded as he left them, and form a shrine to which there is a constant pilgrimage. The Haverhill homestead, memorialized in Snow-Bound, is also held by trustees "of the Poet's Farm Association," and "the natural features of the landscape," and to keep the buildings and furniture somewhat as they were in their minstrel's boyhood.

It would be unjust to consider Whittier's genius from an academic point of view. British lovers of poetry—except John Bright and others of like faith or spirit—have been slow to comprehend his distinctive rank. As a poet he was essentially a balladist, with the faults of the type. Early ballads, and ballads of a later day, like "Freedom," and their undue length, are among the few modern examples of unpolished verse. He returned again and again to their production, since they seemed to express his life and spirit and the Victorian life. So far for melody was inferior to his sense of time, but that his overfacility and structural defects were due less to lack of taste than to early habit. Georgian models, disassociation from the schools, is indicated by his work as a writer of prose. In Margaret Smith's Journal an artistic, though suggestive, Colonial style is well maintained. Whittier became very sensible of his shortcomings; and when at least to a certain extent he succeeded in correcting them, as for instance by Whittier would " turn out a song," or "perhaps turn out a sermon"; if the latter, it had deep sincerity and was as close to his soul as the other. He began as a liberator, and various causes empleased him. His early work was "If I Were King," which stood out of the rest; he loved a worker, and the Songs of Labor convey the zest of the artisan and pioneer. From 1832 to 1863 no occasion escaped him for inspiring the assailants of slavery, or cranking panaceas of their martyrdom or triumph. No crusade ever had a truer laureate than the author of "The Virginia Slave Mother," "The Pastoral Letter"—one of his stinging ballads against a time-serving Church—"A Sabbath Scene," and "The Slaves of Martinique." Randolph of Roanoke is "one of the most pathetic and most elevated of memorial tributes." Ichabod and "The Lost Occasion," both eulogies of the Stephen of Webster, are Roman in their condemnation and "with all regrett." The green Rusticity of Whittier's farm and village life imparted a brooding charm to such lyrics as "In School Days," "The Bare- foot in the Snow," "The Bee," "The Slaves of Martinique," "The Thistle and the Cedar," and "The专职民." His idyllic masterpiece is the sustained transcript of winter scenery and home-life, Snow-Bound, which has no equal except Longfellow's Evangeline. It is an American favour, but, in fact, nothing of its class since "The Cotter's Saturday Night" can justly be compared with it. Along with the Quaker poet's homing sense and passion for liberty of body and soul, religion and patriotism are the dominant notes of his song. His conception of a citizen's prerogative and duty, as set forth in "The Eve of Election," certainly is not that of one whose legend is "our country, right or wrong." Faith, hope and boundless charity pervade the "Questions of Life," "The Two Angels," and are exclusively blended in "The Eternal Goodness," perhaps the most enduring of his lyrical poems. We can do without a Church," he wrote in a letter; "we cannot do without life and liberty." It was his inspiration, and of all American poets he was the one whose song was most like a prayer. A knightly celibate, his stainless life, his arbour, caused him to be termed a Yankee Gahdah; a pure andsingle heart was hid bare to those who knew him in "My Psalm," "My Triumph," and "An Autograph." The spiritual habit abated no whit of his inborn sagacity, and it is said that in his later years political leaders found no shredder wise with whom to debate. He was a matchless and question answering "tactician." He was canvassed by a group of the public men of Lincoln's time, the vote was for Whittier; he was at least one whom they understood, and "the immortal poet," with the "abolition ballads," and, I am sure, was greatly pleased. A few years before his death, it was attempted to crown him "the poet of New England," but as the North and West then were charged with the spirit of the New England states, the two verdicts were much the same. The fact remains that no other poet has possessed so much of the poetry of the people. The people are, in that respect, the most English of the nations, that is to say, the most chivalric, the most learned, the most courtly, and that Whittier's name, among the patriotic, clean and true, was one with which to conjure. He was revered by the people claving to their altars and their fires, and his birthdays were calendared as festivals, on which greetings were sent to him by young and old.

In his age the poet revised his works, classifying them for a definitive edition, in seven volumes, published at Boston, 1888. Their metrical portion, annotated by Horace E. Scudder, can be procured in a recent and more complete edition of his "Life and Letters," prepared by his kinsman and literary executor, Samuel T. Pickard, also appeared in 1894.

WHITTINGHAM, CHARLES (1767-1840), English printer, was born on the 16th of June 1767, at Caludon or Calloton, Warwickshire, the son of a farmer, and was apprenticed to a Coventry printer and bookseller. In 1780 he set up a small printing press in a garret off Fleet Street, London, with a loan obtained from the typefoundry firm of William Caslon, and by 1795 his business had so increased that he was enabled to move into larger premises. An edition of Gray's Poems, printed by him in 1799, secured him the patronage of all the leading publishers. Whittingham inaugurated the idea of printing cheap, handy editions of standard authors, and, on the book-selling trade threatening not to sell his productions, took a room at a coffee house and sold them by auction himself. In 1809 he started a paper-pulp factory at Chiswick, near London, and in 1811 founded the Chiswick Press. From 1816 to 1819 he devoted himself to the production of the "Christian Robinson," which having been the first to use proper overlays in printing woodcut figures, as he was the first to print a fine, or "Indian Paper" edition. He was one of the first to use a steam-engine in a pulp mill, but his presses he preferred to have worked by hand. He died at Chiswick on the 5th of January 1840.

His nephew, Charles Whittingham (1795-1879), who from 1824 to 1838 had been in partnership with his uncle, in 1838 assumed control of the business. He already had printing works at Tooke's Court, Chancery Lane, London, and had printed the Authorized Version of the Bible, and had brought out a reproduction of ornamental initial letters, and the artistic arrangement of the printed page. The imprint of the Chiswick press was now placed on the productions of the Tooke's Court as well as of the Chiswick works, and in 1852 the whole business was removed to London. Under the management of the younger Whittingham the Chiswick Press achieved a considerable reputation. He died on the 21st of April 1876.

WHITTINGHAM, WILLIAM (c. 1524-1579), English scholar, who belonged to a Lancashire family, was born at Chester. Educated at Brasenose College, Oxford, he became a fellow of All Souls' College and a senior student of Christ Church, and later he visited several universities in France and Germany. A strong Protestant, he returned to England in 1553, but soon found it expedient to travel again to France. In 1554 he was a leading member of the band of English Protestant exiles who were assembled at Frankfurt-on-the-Main, and in the controversies which took place between them concerning the form of service to be adopted, Whittingham strongly supported the Calvinistic views propounded by John Knox. These opinions, however, did not prevail, and soon the Scottish reformer and his follower were found at Geneva; in 1559 Whittingham succeeded Knox as minister of the English congregation in that city, and here he did his most noteworthy work, that of making an English translation of the Bible. He was probably responsible for the English translation of the New Testament which appeared in 1557, and he had certainly a large share in the translation of both the Old and the New Testaments which is called the Geneva or Breeches Bible. This was printed at Geneva in 1560 and translated into English in the same year. His first continental work was a translation of St. John's Gospel, and his last English translation was a metrical version of some of the Psalms. Having returned to England in 1560, Whittingham went to France in the train of Francis Russell, 2nd earl of Bedford, and a little later he acted as minister of the English garrison at Havre, being in this place during its siege by the French in 1562. In the following year he was made dean of Durham. He attended well to the duties of his office, but his liking for puritan customs made
certain prelates and others look upon him with suspicion, and in 1576 or 1577 a commission was appointed to inquire into his conduct. This had no result, and another commission was appointed in 1578, one charge against Whittingham being that he had not been duly ordained. The case was still under commission when the dean died on the 10th of June 1579.

**Whittington, Richard** (d. 1423), mayor of London, described himself as son of William and Joan (Dugdale, _Monasticon Anglicanum_, vi. 740). This enables him to be identified as the third son of Sir William Whittington of Pauntley in Gloucestershire, a knight of good family, who married after 1355 Joan, daughter of William Mansel, and widow of Thomas Berkeley of Cubberley. Consequently Richard was a very young man when he is mentioned in 1379 as subscribing five marks to a city loan. He was a mercer by trade, and clearly entered on his commercial career under favourable circumstances. He married Alice, daughter of Sir Ivo Fitzwaryn, a Dorset knight of considerable property. Whittington sat in the common council as a representative of Coleman Street Ward, was elected alderman of Broad Street in March 1393, and served as sheriff in 1393–1394. When Adam Bamme, the mayor, died in June 1397, Whittington was appointed by the king to succeed him, and in October was elected mayor for the ensuing year. He had acquired great wealth and much commercial importance, and was mayor of the staple at London and Calais. He made frequent gifts to the church, as may be seen from the following entry in Whittington's will, made in 1406–1407, and proved in 1410. It was observed (J. Britton, 3rd ser. vi. 229) that the bequests of Whittington and those of the Frenchman, Fitzgerald, are the only examples of early wills in the National Archives in which bequests are made to the church.

Whittington's foundations was his chapel, which he founded in the churchyard of St Michael, Paternoster Row, and the adjoining hospital. The college was dissolved at the Reformation, but the hospital or almshouses are still maintained by the Mercers' Company at Highgate. Whittington was buried at St Michael's church. Stow relates that his tomb was spoiled during the reign of Edward VI., but that under Mary the parishioners were compelled to restore it (Stow, i. 243). Whittington had a house near St Michael's church; it is doubtful whether he had any connexion with the so-called Whittington Palace in Hart Street, Mark Lane. There is no proof that he was ever knighted; Stow does not call him Sir Richard. Much of Whittington's fame was probably due to the magnificence of his charities. But a writer of the next generation bears witness to his commercial success in _A Libell of English Policy_ by styling him "the sunne of marchaundy, that lodestarre and chief-chosen flower."

"Pen and paper may not me suffice
Him to describe, so high he was of price."

The Richardson Whittington of history is thus very different from the Dick Whittington of popular legend, which makes him a poor orphan employed as a scavenger by the rich merchant, Sir Hugh Fitzwarren, who ventures the cat, his only possession, on one of his master's ships. Distressed by ill-treatment he runs away, but turns back when he hears from Holloway the prophetic peal of Bow bells. He returns to find that his venture has brought him a fortune, marries his master's daughter, and succeeds to his property. The legend is not referred to by Stow, whose love for exposing falsehoods would assuredly have prompted him to notice if it had been well established when he wrote. The first reference to the story comes with the licensing in 1605 of a play, now lost, by John Marston, wherein J. Whittington, "in his love byth, his great fortune. Thomas Heywood in 1606 makes one of the characters in _If you know not me you know nobody, _allude to the legend, to be rebuked by another because "they did more wrong to the gentleman."

"The legend of Whittington," probably meaning the play of 1605, is also mentioned by Beaumont and Fletcher in 1611 in _The Knight of the Burning Pestle_. The story was then no doubt popular. When a little later Robert Elstracke, the engraver, published a supposed portrait of Whittington with his hand resting on a skull, he had in deference to the public fancy to substitute a cat; copies in the first state are very rare. Attempts have been made to explain the story as possibly referring to vessels called "cats," which were employed in the North Sea trade, or to the French _achat_ (purchase). But Thomas Keightley traced the cat story in Persian, Danish and Italian folklore at least as far back as the 13th century. The assertion that a carved figure of a cat existed on Newgate goal before the great fire is an unsupported assumption.

**Bibliography.**—The most important early references to Whittington are contained in _Dr R. R. Sharpe's Calendar of Letters of Edward IV._ (Rili's _Memorials of London_ and _Political Songs, _ii. 478 (Rolls series). For his charities see _Stow's Survey of London_ (ed. C. L. Kingsford, 1908). For documents relating to Whittington see the Record Office, Dugdale, _A _History of the City of London_, and the _Collected State Papers of England, 1485–1603_.

WILLIAM, archbishop of Canterbury, was probably born in the Cambridgeshire village of Whittlesey. He was educated at Oxford, and owing principally to the fact that he was a nephew of Simon Islip, archbishop of Canterbury, he received numerous ecclesiastical preferments, he held prebends at Lichfield, Chichester and Lincoln, and livings at Ixwich, Croydon and Cliffe. Later he was appointed vicar-general, and then dean of the arch of arched by Islip. In 1360 he became bishop of Rochester, and two years later bishop of Worcester. In 1368 Whittlesey was elected archbishop of Canterbury in succession to Simon Langham, but his term of office was very uneventful, a circumstance due partly, but not wholly, to his feeble health. He died at Lambeth on the 5th or 6th of June 1374.

Whittlesey, a market town in the Wisbech parliamentary division of Cambridgeshire, England, 53 m. E. of Peterborough, between that city and March, on the Great Eastern railway. Pop. of urban district (1901) 3099. It lies on a gentle eminence in the flat fen country, and the fine Perpendicular tower and spire of the church of St Mary are a landmark from far. A little to the north is the great artificial cut carrying the waters of the
WHITWORTH—WHOOPING-COUGH

river Nene; and the neighbourhood is intersected with many other navigable "drains." To the south-west is the tract known as Whittlesey Mare, 6 m. distant from the town, in Huntingdonshire. It was a lake until modern times, when it was included in a scheme measurement and the so-called Whittlesey Wash, in the neighbourhood of the town, is among several tracts in the fens which are perennially flooded. St Mary's church is principally Perpendicular, but has Norman and Decorated portions; the church of St Andrew is also Decorated and Perpendicular. The town has manufactures of bricks and tiles, and a considerable agricultural trade.

WHITWORTH, SIR JOSEPH, Bart. (1803–1837), English engineer, was born at Stockport, near Manchester, on the 21st of December 1803. On leaving school at the age of fourteen, he was placed with and by a man who was a cotton-spinner, with the view of becoming a partner in the business; but his mechanical tastes were not satisfied with this occupation, and in about four years he gave it up. He then spent some time with various machine manufacturers in the neighbourhood of Manchester, and in 1825 moved to London, where he gained more experience in machine shops, including those of Henry Maudslay. In 1833 he returned to Manchester and started in business as a tool-maker. In 1840 he attended the meeting of the British Association at Glasgow, and read a paper on the preparation and value of true planes, describing the method which he had successfully used for making them when at Maudslay's. In 1841 he published on the principle that if any two of three surfaces exactly fit each other, all three must be true planes. The accuracy of workmanship thus indicated was far ahead of what was contemplated at the time as possible in mechanical engineering, but Whitworth not only proved that it could be attained in practice, but also showed how it could be measured. He found that if two true planes were arranged parallel to each other, an exceedingly small motion towards or from each other was sufficient to determine whether an object placed between them was held firmly or allowed to move. By mounting two screw-shafts with a large wheel bearing on a single periphery, he was able to obtain a very exact measurement of the amount, however minute, by which the distance between the planes was altered, by observing through what angular distance the wheel had been turned. In 1841, in a paper read before the Institution of Civil Engineers, he urged the necessity for the adoption of a uniform system of screw threads in place of the various heterogeneous pitches then employed. His system of standard gauges was also widely adopted. The principles of these gauges and of the instrument invented by him which depended upon them were exactly adopted in his own manufacturer, with the result that in the Exhibition of 1851 he had a show of machine tools which were far ahead of those of any competitor. It was doubtless this superiority in machine construction that caused the government three years later to request him to design, and estimate for making, the machinery for producing rifled muskets at the new factory at Enfield. He did not see his way to agree to the proposition in this form, but it was ultimately settled that he should undertake the machinery for the barrels only. Finding that there was no established practice to guide him, he began a series of experiments to determine the best principles for the manufacture of rifle barrels and projectiles. He ultimately arrived at a weapon in which the necessary rotation of the projectile was obtained, not by means of grooving, but by making the barrel polygonal in form, with gently rounded angles, the bullets also being polygonal and thus travelling on broad bearing-surfaces along the rotating polygon. The projectile he favoured was 3 to 3½ calibres in length, and the bore he fixed on was 0-45 in., which was at first looked upon as too small. It is reported one at the trial in 1857 weapons made according to these principles excelled the Enfield weapon in accuracy of fire, penetration and range to a degree "which hardly leaves room for comparison." He also constructed heavy guns on the same lines; these were tried in competition with Armstrong's ordnance in 1864 and 1865, and in their inventor's opinion gave the better results, but they were not adopted by the government. In constructing them Whitworth experienced difficulty in getting large steel castings of suitable soundness and ductility, and thus was led about 1870 to devise his compressed steel process, in which the metal is subjected to high pressure while still in the fluid state, and is afterwards forged in hydraulic presses, not by hammers. In 1868 he founded the Whitworth scholarship, setting aside an annual sum of £3000 to be given for "intelligence and proficiency in the theory and practice of mechanics and its cognate sciences," and in the following year he was created a baronet. He died at Monte Carlo, whither he had gone for the sake of his health, on the 22nd of January 1887. In addition to handing over £100,000 to the Science and Art Department for the permanent endowment of the thirty Whitworth scholarships, his residuary legatees, in pursuance of what they knew to be his intentions, expended over half a million on charitable and educational objects, mainly in Manchester and the neighbourhood.

WHOOPING-COUGH, or Hooping-Cough (syn. Pertussis, Chin-cough), a specific infective disease of the respiratory mucous membrane, of microbic origin (see Parasitic Diseases), manifesting itself by frequently recurring paroxysms of convulsive coughing accompanied with peculiar sonorous inspirations (or whoops). Although specially a disease of childhood, whooping-cough is by no means limited to that period but may occur at any time of life. It is one of the most dangerous diseases of infancy, the yearly death-rate in England and Wales for each of the five years 1850–1854 was per hundred births. In the interregnum it was noted that supposing a child to have given in the symptoms to indicate that they are to develop into whooping-cough, but the presence of an ulcer on the fraenum linguae is said to be diagnostic. The catarrhal stage usually lasts from ten to fourteen days. The second stage is marked by the abatement of the catarrhal symptoms, but at the same time by increase in the cough, which now occurs in irregular paroxysms both by day and by night. Each paroxysm consists in a series of violent and rapid expiratory coughs, succeeded by a loud sonorous or crowing inspiration—the "whoop." During the coughing itself the air is derived at but one stroke out of the lungs, and the air is the only air that the patient can command. In fact, the chest the symptoms of impending asphyxia appear. The patient grows deep-red or livid in the face, the eyes appear as if they would burst from their sockets, and suffocation seems imminent till relief is brought by the "whoop"—the louder and more vigorous the better. Occasionally blood bursts from the nose, mouth and ears, or is extravasated into the conjunctiva of the eyes. A single fit rarely lasts beyond from half to three-quarters of a minute, but after the "whoop" another recur, and of these a number may come and go for several minutes. The paroxysm ends by the coughing or vomiting of a greater or less quantity of mucus and phlegm. If the disease is long continued the patient seems comparatively well, or, it may be, somewhat wearied and fretful. The frequency of the paroxysms varies according to the severity of the case, being in some instances only to the extent of one or two in the whole day, while in others there may be several in the course of a single hour. Slight causes serve to bring on the fits of coughing, such as the acts of swallowing, talking, laughing, crying, &c., or they may occur without any apparent exciting cause. In general children come to recognize an impending attack by a feeling of tickling in the throat, and they, after being the less than the mothers or others think, or take hold of some object near them for support during the paroxysm; but although exhausted by the severe fit of coughing they soon resume their play, apparently little the worse. The attacks are on the whole most severe at night. This stage of the disease usually continues for thirty to fifty days, but it may
be shorter or longer. It is during this time that complications attempt to arise which may become a source of danger greater even than the malady itself. The chief of these are inflammatory affections of the bronchi and lungs and convulsions, any of which may prove fatal. When, however, the disease progresses favourably, the third or terminal stage is announced by the less frequent paroxysms of the cough, which generally loses in great measure its “whooping” character. The patient’s condition altogether undergoes amendment, and the symptoms disappear in from one to three weeks. It is to be observed, however, that for a long period afterwards in any simple catarh from which the patient suffers the cough often assumes a spasmodic character, which may suggest the erroneous notion that a relapse of the whooping-cough has occurred.

In severe cases it occasionally happens that the disease leaves behind it such structural changes in the lungs (emphysema, &c.), as entail permanent shortness of breathing or a liability to attacks of asthma. Further, whooping-cough is well known to be one of those diseases of early life which are apt to give rise to a weakened and vulnerable state of the general health, or to call into activity any inherited morbid tendency, such as that towards consumption.

The treatment in mild cases, little is necessary beyond keeping the patient warm and carefully attending to the general health. Systematized disinfection of the sputum by means of a solution of corrosive sublimate or by burning should be practised in order to check the spread of infection. In the more severe forms cough is often overtopped by a neighboring tendency to modify the severity of the paroxysms. Numerous remedies are recommended, the chief of which are the bromides of ammonium or potassium, chloral, codeine, &c. These can only be safely administered under medical advice, and with due regard to the symptoms in individual cases. During convalescence, where the cough still continues to be troublesome, a change of air will often effect its removal.

WHYMPER, EDWARD (1840— ), British artist, explorer and mountaineer, was born in London on the 27th of April 1840. The son of an artist, at an early age trained to the profession of a wood-engraver. In 1865 he was commissioned to make a series of sketches of Alpine scenery, and undertook an extensive journey in the Central and Western Alps. Among the objects of this tour was the illustration of an attempt, which proved unsuccessful, made by Professor Bonney’s party, to ascend Mont Pelvoux, at that time believed to be the highest peak of the Dauphine Alps. He successfully accomplished the ascent in 1861—the first of a series of expeditions that threw much light on the topography of a district at that time very imperfectly mapped. From the summit of Mont Pelvoux he discovered that it was overtopped by a neighbouring peak, which he named the Pointe des Écrins, which, before the annexation of Savoy added Mont Blanc to the possessions of France, was the highest point in the French Alps. Its ascent by Mr Whymper’s party in 1864 was perhaps the most remarkable feat of mountaineering up to that date. The years 1860 to 1865 are filled with a number of new expeditions in the Mont Blanc group and the Pennine Alps, among them the ascent of the Aiguille Vert and the crossing of the Morning Pass. Professor Tyndall and Mr Whymper emulated each other in fruitless attempts to reach the summit of the Matterhorn by the south-western or Italian ridge. Mr Whymper, six times repulsed, determined to try the eastern face, convinced that its precipitous appearance when viewed from Zermatt was an optical illusion, and that the dip of the strata, which on the Italian side formed a continuous series of overhangs, should make the opposite side a natural staircase. His attempt by what is now the usual route was crowned with success (14th of July 1865); but on the descent four of the party slipped and were killed, and only the breaking of the rope saved Mr Whymper and the two remaining guides from the same fate. The account of his attempts on the Matterhorn occupies the greater part of his Scrambles among the Alps (1871), in which the illustrations are engraved by the author himself, and are very beautiful. His campaign of 1865 had been planned to exercise his judgment in the choice of routes as a preparation for an expedition to Greenland (1867). This resulted in an important collection of fossil plants, which were described by Professor Heer and deposited in the British Museum. Mr Whymper’s report was published in the Report of the British Association for the year 1869. Though hampered by want of means and by the prevalence of an epidemic among the natives, he proved that the interior could be explored by the use of suitably constructed sledges, and thus contributed an important advance to Arctic exploration. Another expedition followed in 1872, and was devoted to a survey of the coast-line. He next organized an expedition to Ecuador, designed primarily to collect data for the study of mountain-sickness and of the effect of diminished pressure on the human frame. He took as his chief guide Jean-Antoine Carrel, whose subsequent death from exhaustion on the Matterhorn after bringing his employers into safety through a snowstorm forms one of the noblest pages in the history of mountaineering. During 1880 Mr Whymper on two occasions ascended Chimborazo, whose summit, 20,500 ft. above sea-level, had never before been reached; spent a night on the summit of Cotopaxi, and made first ascents of half-a-dozen other great peaks. In 1882 he published the results of his journey in a volume, entitled Travels amongst the Great Andes of the Equator. His observations on mountain-sickness led him to conclude that it was caused by “diminution in atmospheric pressure, which operates in at least two ways—namely, (a) by lessening the value of the air that can be inspired in any given time, and (b) by causing the air or gas to assume a higher degree of density than when breathed at a lower altitude.” In 1883 he contributed an article on mountaineering to Professor Digby’s British Association for the Year Book. In 1884 he contributed a paper on the mountain-sickness of the lower altitudes to the Royal Geographical Society. He has been a member of the Physical Society, and is chairman of the Alpine Club.

WHYTE, ALEXANDER (1837— ), Scottish divine, was born at Kirkriemuir in Forfarshire on the 13th of January 1837, and was educated at the university of Aberdeen and at New College, Edinburgh. He entered the ministry of the Free Church of Scotland and after serving as colleague in Free St John’s, Glasgow (1866—1870), removed to Edinburgh as colleague and successor to Dr R. S. Candlish at Free St George’s. In 1900 he succeeded Dr Marcus Dods as principal, and professor of New Testament Literature, at the University of Edinburgh, and was made an external examiner in the degree of Doctor of Laws at the University of Edinburgh. He was appointed to the chair of Biblical Criticism and Exegesis in the University of Edinburgh in 1901—1902, and afterwards became principal of the New College, Edinburgh.

Among his publications are Characters and Characteristics of William Law (1836); Bunyan Characters (3 vols., 1844); Samuel Rutherford (1894); An Appreciation of Jacob Behmen (1895); Lancelot Andrews and his Private Devotions (1898); Biblical Characters (7 vols., 1897); Santa Teresa (1887); Father John of Cronstadt (1898); An Appreciation of Browne’s Religio Medici (1898); Cardinal Newman, An Appreciation (1901).

WHYTE-MELVILLE, GEORGE JOHN (1821—1878), English novelist, son of John Whyte-Melville of Strathkiness, Fife, and grandson on his mother’s side of the 5th duke of Leith, was born on the 19th of June 1821. Whyte-Melville received his education at Eton, entered the army in 1839, became captain in the Coldstream Guards in 1846 and retired in 1849. After translating Horace (1850) in fluent and graceful verse, he published his first novel, Digby Grand, in 1853. The unflagging verve and intimate technical knowledge with which he described sporting scenes and sporting characters at once drew attention to him as a novelist with a new vein. He was the laureate of fox-hunting;
all his most popular and distinctive heroes and heroines, Dibgy Grand, Tilbury Nogo, the Honourable Crasher, Mr Sawyer, Kate Coventry; Mrs Lascelles, are or would be mighty hunters. *Tilbury Nogo* was contributed to the *Sporting Magazine* in 1833 and published separately in 1834. He showed in the adventure of Mr Nogo—and it became more apparent in his later works—that he had a surer hand in humorous narrative than in pathetic description; his pathos is the pathos of the preacher. His next novel, *General Bounce*, appeared in *Fraser's Magazine* (1834). When the Crimean War broke out Whyte-Melville went out as a volunteer major of Turkish irregular cavalry; but this was the only break in his literary career from the time that he began to write novels till his death. By a strange accident, he lost his life not long after in the coach on the road from Dublin to Wexford; the horse of many a stiff ride meeting his fate in galloping quietly over an ordinary ploughed field in the Vale of the White Horse.

Twenty-one novels appeared from his pen after his return from the Crimea—*Kate Coventry* (1856); *The Interpreter* (1858); *Holmby House* (1860); *God for Nothing* (1861); *Market Harborough* (1861); *The Queen's Maries* (1862); *The Gladiators* (1863); *Brooklyn of Bridlemere* (1864); *Cerise* (1865); *Bones and I* (1866); *The White Rose* (1868); *M or N* (1869); *Contraband* (1870); *Sarchedon* (1871); *Satanella* (1873); *Uncle John* (1874); *Sister Louise* (1875); *Kater- rina* (1875); *Renn嵌s* (1876); *Romantic Comedy* (1878). Several of these novels are historical, *The Gladiators* being perhaps the most famous of them. As an historical novelist Whyte-Melville had no fault to find with writer in paint. His genius is in patience, consistency, and minuteness of detail; but he makes his characters live and move with great vivacity. It is his portrayal of contemporary sporting society that his reputation as a novelist rest; and, though now and then a character reconstructed as the supercilious steward, the dark and wary steeple-chaser, or the fascinating sporting widow, his work has been enjoyed for the class of incidents is amusing. Whyte-Melville was not merely the annalist of sporting society for his generation, but may also be fairly described as the principal moralist of that society; he exerted a considerable and a wholesome influence on the manners and morals of the gilded youth of his time. His *Songs and Verses* (1865) and his metrical *Legend of the True Cross* (1873), though respectable in point of versification, are of no particular merit.

**WICHITA**, a tribe of North American Indians of Caddoan stock. They called themselves Kilkikish or Tawhash. Their former range was between the Red and Washita rivers, Oklahoma, and they are now on a reservation there. They were kinmen of the Pawnee, and the French called them *Pani Pigued* ("Tattooed Pawnee"). They were known to other Indians as the "Tattooed People" in allusion to the extensive tattooing customary among them. They numbered 3000 in or about 1800, but only 400 now survive.

**WICHITA**, a city and the county-seat of Sedgwick county, Kansas, U.S.A., on the Arkansas river, at the mouth of the Little Arkansas, 208 m. (by rail) S.W. of Kansas City. Pop. (1880) 4911; (1890) 23,833; (1900) 24,671, of whom 1447 were foreign-born and 1389 were negroes; (1910 census), 52,450. Area, 18-75 sq. m. Wichita is served by the Atchison, Topeka & Santa Fé, the Chicago, Rock Island & Pacific, the Missouri Pacific, the St. Louis & San Francisco, and the Kansas City, Mexico & Orient railways. The site of the city is level, about 320 ft. above the sea. The principal public buildings are the Federal building, the city hall, the county court house, a Y.M.C.A., a building, an auditorium and exposition hall and a Masonic Temple. In Wichita are Fairmount College (Congregational; co-educational; organized as a preparatory school in 1892 and as a college in 1893); Friends' University (Society of Friends; co-educational; 1886); and Mount Carmel Academy and the Pre-Cathedral School (both Roman Catholic). Among the city's parks (area in 1909, 792 acres) is one (Riverside) of 126 acres. The city is supplied with natural gas. Wichita is a transportation centre about an agricultural surrounding, and is an important market for broom-corn. In 1903 it ranked third among the cities of the state in value of its factory product ($73,696,844). The principal industry is slaughtering and meat-packing. The Kansas City, Mexico & Orient railway has carshops here. Wichita, named from an Indian tribe, was settled in 1870, and was chartered as a city in 1871. In 1890 the city adopted by popular vote government by commission under a state law of 1907 providing for a mayor and four commissioners, heads of the executive, finance, streets and public improvements, parks, public buildings and health, and water and lights departments, all elected for two years and nominated by primary election or by petition signed by at least 25 voters.

**WICK**, a royal, municipal and police burgh, seaport and county town of Caithness, Scotland. Pop. (1901) 7971. It is situated at the head of Wick Bay, on the North Sea, 327 m. N. of Edinburgh, by the North British and Highland railways. It consists of the old burgh and Louisburgh, its continuation, on the north bank of the river Wick, and of Pulteneytown, the chief seat of commerce and trade, on the south side. Pulteneytown, laid out in 1805 by the British Fishery Society, is built on a regular plan; and Wick proper consists chiefly of the narrow and irregular High Street, with Bridge Street, made in 1768, built, which contains the town hall and the county buildings. In Pulteneytown there are an academy, a chamber of commerce, a naval reserve station and a fish exchange. Among other buildings are the free libraries, the Rhind Charitable Institution and the combination hospital. The port consists of two harbours of fair size, but the entrance is dangerous in stormy weather. The chief exports are fish, cattle and agricultural produce, and the imports include coal, wood and provisions. Steamers from Leith and Aberdeen run twice a week and there is also weekly communication with Stromness. There are also cooperage, the manufacture of fish-guano and fish products, flour mills, steam saw mills, a ropery and a woolen manufactory, a brewery and a distillery. The town, with Cromarty, Dingwall, Dornoch, Kirkwall and Tain, forms the Wick group of parliamentary burghs. Wick (Vik or "bay") is mentioned as early as 1140. It was constituted a royal burgh by James VI. in 1586, its superior being then George Sinclair, 5th earl of Caithness. By a parliamentary bounty in 1768 some impetus was given to the herring-fishery, but its real importance dates from the construction of herring factories in 1808.

**WICKLOW**, a county in Ireland in the province of Leinster, bounded E. by St George's Channel, N. by the county of Dublin, S. by Wexford and W. by Carlow and detached portions of Kildare. The area is 500,216 acres or about 782 sq. m. Wicklow is among the most famous counties of Ireland for beauty of scenery, both coastal and more especially inland. The coast is precipitous and picturesque, but very dangerous of approach owing to sandbanks. There are no inlets that can be properly termed bays. The harbour at Wicklow has a considerable trade; but that of Arklow is suitable only for small vessels. To the north of the town of Wicklow there is a remarkable shingle beach, partly built up by the waves and currents. The central portion of the county is occupied by a mountain range, forming one of the four principal mountain groups of Ireland. The direction of the range is from N.E. to S.W., and the highest elevations are generally attained along the central line. The range consists of long sweeping moorlands, rising occasionally by precipitous escarpments into culminating points, the highest summits being Kippure (2473 ft.), Duft Hill (2362), Table Mountain (2416) and Lugnaquilla (3060), the last acquired by the War Office for the training of the military. The range rises from the north by a succession of ridges intersected by deep glen, and subsides towards the borders of Wexford and Carlow. To the north its foothills enter county Dublin, and add attraction to the southern residential outskirts of the capital.

In the valleys there are many instances of old river terraces, the more remarkable being those at the lower end of Glenmalure and the lower end of Glenlough. It is in its deep glen that
much of the peculiar charm of Wicklow scenery is to be found, the frequently rugged natural features contrasting finely with the rich and luxuriant foliage of the extensive woods which line their banks. Among the more famous of these glens are Glen-
dalough, Dargle, Glencree, Glen of the Downs, Devil’s Glen, Glenmalure and the beautiful vale of Avoca or Ovoca. The principal rivers are the Liffey, on the north-western border; the Vartry, which passes through Devil’s Glen to the sea north of Wicklow Head; the Avonmore and the Avonbeg, which unite at the “meeting of the waters” to form the Avoca, which is afterwards joined by the Aughrim and falls into the sea at Arklow; and the Slaney, in the west of the county, passing southwards into Carlow. There are a number of small but finely situated lakes in the valleys, the principal being Loughs Dan, Bray and Tay or Luggelaw, and the loughs of Glendalough. The trout- fishing is generally fair. Owing to its proximity to Dublin and its accessibility from England, the portions of the county possessing scenic interest have been opened up to great advantage. Bray in the north is of the character of a seaside resort in the country, and Greystones, 5 m. S. of it, the smaller one. Of the small towns and villages inland which are much frequented for the beauty of the country in which they lie, are Enniskerry, west of Bray, and near the pass of the Scalp; Laragh, near Glendalough, from which a great military road runs S.W. across the hills below Lugnaquilla; and, on the railway south of Wicklow, Rathdrum, a beautifully situated village, Woodenbridge in the Vale of Avoca and Aughrin. Near the village of Shillelagh lies the wood which is said to have given the name of skillelagh to the的土地. The churchwardsen stations used by Irishmen, Ashford and Roundwood on the Vartry river, Delgany near the Glens of the Downs, and Rathnew, a centre of coach routes, especially for the Devil’s Glen, must also be mentioned. The beauty of the central district of the Wicklow mountains lies in its wild solitude in contradistinction to the more gentle scenery of the populated glens. In the extreme north-west of the county Blessington is a favourite resort from Dublin, served by a steam tramway, which continues up the valley of the Liffey to the waterfalls of Pollaphuca. The climate near the sea is remarkably mild, and permits the myrtle and arbutus to grow.

Geology.—Wicklow, as regards its geology, is mainly an extension of county Wexford, the Leinster chain bounding it on the west, and Silurian foothills sloping thence down to the sea. The highland of muscovite-granite, with a marginal zone of mica-schist, produced by contact-metamorphism, includes the chief mineral wealth of Wicklow, north of Bray, its highest point being Lugnaquilla. The rounded heather-clad moors give way to more broken country on either side, with patches of limestone, and the valley of the Vartry is entirely supplied by Dublin is obtained from an artificial lake on the first plateu of the foothills at Roundwood. From Wicklow town to near Bray, red and greenish slates and yellow-brown quartzites, probably Cambrian, form a hilly country, in which rise Carrick Mt., the Great Sugarloaf and Bray Head. Oldahims occurs in this series. Volcanic and intrusive felsites and diorites abound in the Silurian beds of the south, running along the strike of the strata. A considerable amount of gold has been extracted from the valley-gravels north of Croghan Kinsheila on the Wexford border. Tinstone has also been found in small quantities. Lead-ore is raised west of Laragh, and the mines in the Avoca valley have been worked for copper, lead and sulphur, the last-named being obtained from pyrite. Paving-setts are made from the diorite at Arklow, and granite is extensively quarried at Bullyknockan on the west side of the mountain-chain.

History.—The town of Wicklow is the lower end of the valley; and although the greater part of the higher districts is covered with heath and turf, it affords good pasturage for sheep. There is a considerable extent of natural timber as well as artificial plantations. The acreage under permanent pasture is comparatively large and that in the west is chiefly cereals. Crops of oats and potatoes decrease considerably, the numbers of sheep, cattle, pigs and poultry are all maintained. Except in the Avoca district the growing of potatoes is on a very small scale, and some important agricultural occupations are chiefly agricultural. The port of Wicklow is the headquarters of a sea-fishery district.

WICKLOW.—The Dublin and South-Eastern railway skirts the coast by way of Bray and Arklow, which is the chief town of the county. A branch line from Woodenbridge junction to Shillelagh. A branch of the Great Southern & Western line from Sallins skirts the west of the county by Baltinglass.

Population and Administration.—The population (63,492 in 1891, 66,824 in 1901) decreases to a less extent than the average of the Irish counties, and emigration is considerable. Of the total about 80% are Roman Catholics, and 18% Protestant Episcopalians; about 80% forms the rural population. Bray (pop. 7,424), Wicklow (the county town, 3,288) and Arklow (1,944) are the principal towns, all on the coast; Wicklow is the only considerable port. Wicklow returned to the Irish parliament, until the Union in 1800, two county members and two each for the boroughs of Baltinglass, Bray, Tinahely and Arklow; it is now formed into two parliamentary divisions, an eastern and a western each returning one member. The county is divided into eight baronies. It is wholly in the Protestant dioceses of Dublin and in the Roman Catholic dioceses of Dublin, Kildare and Leighlin and Ferns. Assizes are held at Wicklow, and quarter sessions at Bray, Baltinglass, Tinahely, Arklow and Wicklow.

History and Antiquities.—Wicklow was not made a county until 1866. It was the last Irish ground shired, for in this mountainous district the Irish were long able to preserve independence. Wicklow sided with the royal cause during the Cromwellian wars, but on Cromwell’s advance submitted to him without striking a blow. During the rebellion of 1798 some of the insurgents took refuge within its mountain fastnesses, and an engagement took place near Aughrim between a band of Irishmen under Joseph Holt (1776-1826) and the British troops. A second skirmish was fought at Arklow between the rebels and General Needham, the former being defeated.

Of the ancient cromlechs there are three of some interest, one near Enniskerry, another on the summit of Lugnaquilla and a third, with a large circle, at Rathmore. The latter is the most important monastic remains at Rathdrum, Baltinglass and Wicklow. The ruins in the vale of Glendalough, known as the “seven churches,” including a perfect round tower, are, perhaps excepting Clonmacnoise, the most remarkable ecclesiastical remains in Ireland. They owe their origin to St. Kevin, who lived in the vale as a hermit, and is reputed to have died on the 3rd of June 618. Of the old fortalice or castles associated with the early wars, those of special interest are Black Castle, near Wicklow, originally founded by the Norman invaders, but taken by the Irish in 1301, and afterwards rebuilt by William Fitzwilliam; the scattered remains of Castle Kevin, the ancient stronghold of the O’Tooles, by whom it was probably originally built in the 12th century; and the ruins of the old castle of the Ormondes at Arklow, founded by Theobald FitzWalter (d. 1285), the scene of frequent contests up to the time of Cromwell, by whom it was demolished in 1649, and now containing within the interior of its ruined walls a castellary barrack. The fine mansion of Powercourt occupies the site of an old fortalice founded by De la Poer, one of the ancient proprietors of the lands of Strongbow; in the reign of Henry VIII. it was taken by the O’Tooles and O’Flynn.

WICKLOW, a seaport, market town, and the county town of county Wicklow, Ireland, picturesquely situated at the mouth of a lagoon which receives the river Vartry and other streams, 28½ m. S. of Dublin by the Dublin & South-Eastern railway. Pop. (1901) 3288. The harbour, which is governed by commissioners and can accommodate vessels of 1500 tons, has two piers, with quarantine. There is a considerable import trade in coal, timber, iron and slate; and some exports of grain and metallic ore, but the latter suffers by competition with the imports to Britain of sulphur ore from Spain. The town has county buildings, a parish church embodying a good Norman door from a previous structure, some ruins of a Franciscan abbey of the 13th century, and remains of Black Castle, on a commanding situation above the sea, founded in Norman times and rebuilt by William Fitzwilliam after capture by the Irish in 1301. The name shows the town to have been a settlement of the Norsmen. The cliff scenery to the S. towards Wicklow Head is fine, and the town has some claims as a seaside resort. It is governed by an urban district council.

WICKRAM, Jörg, or Jörg (d. c. 1560). German poet and novelist, was a native of Colmar in Alsace; the date of his birth is unknown. He passed the latter part of his life as town clerk of Burghem on the Rhine, and died before 1562. Wickram was a many-sided writer. He founded a Meistersinger school in Colmar in 1540, and has left a number of Meistersingertöchter. He edited Albrecht von Halberstadt’s Middle High German version of Ovid’s Metamorphoses (1543), and in 1555 he published Das Rollwagenbüchlein, one of the best of the many German collections of tales and anecdotes which appeared in the 16th century. The title of the book implies its object, namely, to
supply reading for the traveller in the "Rollwagen" or diligences. As a dramatist, Wickram wrote Fastnachtszene (Das Narren-, 1537; Der treue Eckart, 1538) and two dramas on biblical subjects, Der verlorene Sohn (1540) and Tobias (1551). A moralizing poem, Der irrezierte Pflüger (1556), is half-satiric, half-didactic. It is, however, as a novelist that Wickram has left the deepest mark on his time, his chief romances being Ritter Galmy aus Schottland (1539), Gebroth und Reinhard (1554), Der Knabenkrieg (1554), Von guten und bösen Nachborn (1556) and Der Goldfaden (1557). These may be regarded as the earliest attempts in German literature to create that modern type of mediaval romance which ultimately took the place of the decadent medieval romance of chivalry.

Wickram's works have been edited by J. Bolte and W. Scheld for the Stuttgart Literarische Verein (vols., 222, 223, 229, 230, 1900-1903); Der Ritter Galmy was republished by F. de la Motte Fouqué (1846); W. Scherker, Der Aufstand der Deutschen (1877).

WIDDRINGTON, BARONS. In November 1643 Sir William Widdrington (1610-1651), of Widdrington, Northumberland, son of Sir Robert and Elizabeth Whittingham, married, on 24 December, 1632, Margaret, daughter and sole heir of John Unett, Speaker of the House of Commons, and widow of Charles Fitzherbert, Baron Shalcross, 3rd, and sister of Sir John Unett, Chief Justice, and died at Corvey, in Ireland, 10 September 1651. He had been member for Northumberland in both the Short and the Long Parliaments in 1640, but in August 1642 he was expelled because he had joined the royal standard. He fought for the king chiefly in Yorkshire and Lincolnshire during 1642 and 1643; he was governor of Lincoln in 1643, but in 1644, after helping to defend York, he left England. Although in 1648 he had been condemned to death by the House of Commons, he accompanied Charles II. to Scotland in 1650, and he was mortally wounded in the conflict at Preston, dyng in Carmarthen, for September 1651. His great-grandson, William, the 4th baron (1678-1743), took part in the Jacobite rising of 1715, and with two of his brothers was taken prisoner after the fight at Preston. He was convicted of high treason, and his title and estates were forfeited, but he was not put to death, and he survived until the 19th of April 1743. When his son, Henry Francis Widdrington, who claimed the barony, died in September 1774, the family appears to have become extinct.

Other eminent members of this family were Sir Thomas Widdrington, 1st, and his brother Ralph, 2nd, and his grandson, William, 3rd baronet, who became Speaker of the House of Commons, and after the abdication of King Charles II, was created Baron Widdrington, as a reward for his loyalty to Charles I. He had been member for Northumberland in both the Short and the Long Parliaments in 1640, but in August 1642 he was expelled because he had joined the royal standard. He fought for the king chiefly in Yorkshire and Lincolnshire during 1642 and 1643; he was governor of Lincoln in 1643, but in 1644, after helping to defend York, he left England. Although in 1648 he had been condemned to death by the House of Commons, he accompanied Charles II. to Scotland in 1650, and he was mortally wounded in the conflict at Preston, dying in Carmarthen, for September 1651. His great-grandson, William, the 4th baron (1678-1743), took part in the Jacobite rising of 1715, and with two of his brothers was taken prisoner after the fight at Preston. He was convicted of high treason, and his title and estates were forfeited, but he was not put to death, and he survived until the 19th of April 1743. When his son, Henry Francis Widdrington, who claimed the barony, died in September 1774, the family appears to have become extinct.

The name of Roger Widdrington was taken by Thomas Preston (1565-1640), a Benedictine monk, who wrote several books of a controversial nature, and passed much of his time in prison, being still a captive when he died on the 3rd of April 1640. (See Rev. E. Taunton, The English Black Monk of St. Betreded, 1891, and sister of Sir John Unett, Chief Justice, and died at Corvey, in Ireland, 10 September 1651. He had been member for Northumberland in both the Short and the Long Parliaments in 1640, but in August 1642 he was expelled because he had joined the royal standard. He fought for the king chiefly in Yorkshire and Lincolnshire during 1642 and 1643; he was governor of Lincoln in 1643, but in 1644, after helping to defend York, he left England. Although in 1648 he had been condemned to death by the House of Commons, he accompanied Charles II. to Scotland in 1650, and he was mortally wounded in the conflict at Preston, dying in Carmarthen, for September 1651. WIDDOR, CHARLES MARIE (1845- ), French composer and organist, was born at Lyons on the 22nd of February 1845. He studied first at Lyons, then at Brussels under Lemmens for the organ and Fétis for composition. In 1870 he became organist of the church of Saint Sulpice in Paris. He succeeded César Franck as professor of the organ at the Paris Conservatoire, where he was also appointed professor of composition, counterpoint and fugue. His works show a wonderful variety of technique and a rare creative ability in a variety of different styles. His works include an opera, Matière Ambros (Opéra Comique, 1860), La Korrigane (ballet, given at the Opéra, 1880), incidental music to Comte d'Avril (1885), Les Jacobites (1885) and Jeanne d'Arc (a pantomime play, 1890), three symphonies, The Walpurgis Night and other works for orchestra, a quintet for strings and piano, trio for piano and strings, a mass, psalms and other sacred compositions, symphonies for organ, a large number of piano pieces and many songs.

WIDUKIND, Saxxon historian, was the author of Res gestae Saxoniae. Nothing is known of his life except that he was a monk at the Benedictine abbey of Corvey, and that he died about 904, although various other conjectures have been formed by students of his work. He is also supposed to have written lives of St Paul and St Thecla, but no traces of these now remain. It is uncertain whether he was a resident at the court of the emperor Otto the Great or not, and also whether he was on intimate terms with Otto's illegitimate son William, archbishop of Mainz. His Res gestae Saxoniae, dedicated to Matilda, abbess of Quedlinburg, was a daughter of Otto the Great, is divided into dialogues, stories, books, and the greater part of it is not only written during the lifetime of the emperor, probably about 968. Starting with certain surmises upon the origin of the Saxons, he deals with the war between Teutcherich I., king of Austrasia, and the Thuringians, in which the Saxons played an important part. An allusion to the conversion of the race to Christianity under Charlemagne brings him to the early Saxon dukes and the reign of Henry the Fowler, whose campaigns are referred to in some detail. The second book opens with the election of Otto the Great as German king, treats of the risings against his authority, and concludes with the death of his wife Edith in 946. In the third book the historian deals with Otto's expedition into France, his troubles with his son Ludolf and his son-in-law, Conrad the Red, duke of Lorraine, and the various wars in Germany; but makes only casual reference to Otto's visits to Italy in 951 and 962. He gives a vivid account of the defeat of the Hungarians on the Lechfeld in August 955, and ends with the death of Otto in 973 and a eulogy on his life.

Widukind formed his style upon that of Sallust; he was familiar with the De vitis Caesarii of Suetonius, the Annales Magri of Eginhard, and the Vidae de Patribus Germanici. Many quotations from the Vulgate are found in his writings, and there are traces of a knowledge of Virgil, Ovid and other Roman poets. His sentences are occasionally abrupt and lacking in clearness, his Latin words are sometimes germanized (as when he writes michi for mihi) and grammatical errors are not always absent. The earlier part of his work is taken from tradition, but he wrote the contemporary part as one familiar with court life and the events of the day. He says very little about affairs outside Germany, and although laudatory of
WIDUKIND—WIEN

monastic life gives a due prominence to secular affairs. He writes
as a Saxon, proud of the history of his race and an admirer of Henry the Fowler and Otto the Great.

Three manuscripts exist of the Res gestae, one of which is in the British Museum, and the book was first published at Basel in 1532. The best edition is that edited in the Germaniae historica, Scriptores, Band iii. (Hanover and Berlin, 1826). A good edition published at Hanover and Leipzig in 1901 contains an introduction by K. A. Kehr.

See R. Körke, Widukind von Corvey (Berlin, 1867); J. Rasse, Widukind von Corvey (Rostock, 1880); and B. Simon, "Zur Kritik des Widukind" in the Neues Archiv der Gesellschaft für ältere deutsche Geschichte, Band xii. (Hanover, 1875). (A. W. H.)

WIDUKIND, or WITTEKIND (d. c. 807), leader of the Saxons during the earlier part of their resistance to Charlemagne, belonged to a noble Westphalian family, and is first mentioned in 777 when his absence from an assembly of the Saxons held by the Frankish king of Paderborn was a matter of remark. It is inferred with considerable probability that he had taken a leading part in the attacks on two Frankish garrisons in 776, and possibly had shared in earlier fights against the Franks, and so feared to meet the king. In 778 he returned from exile in Denmark to lead a fresh rising, and in 782 the Saxons at his instigation drove out the Frankish priests, and plundered the border territories. It is uncertain whether Widukind shared in the Saxons' victory over the East Saxons, or what part he took in the risings of 783 and 784. In 785 Charlemagne, leading an expedition towards the mouth of the Elbe, learned that Widukind was in the land of the Nordalbingians, on the right bank of the river. Negotiations were begun, and the Saxon chief, assured of his personal safety, appeared at the Frankish court at Attigny. There he was baptized, the king acting as his sponsor and loading him with gifts. The details of his later life are unknown. He probably returned to Saxony and occupied there an influential position, as in 922 the inheritance of the "old count" duke Widukind," is referred to. Many legends have gathered about his memory, and he was long regarded as a national hero by the Saxons. He is reported to have been duke of Engria, to have been a devoted Christian and a builder of churches, and to have fallen in battle in 807. Kingly and princely houses have sought to establish their descent from him, but except in the case of Matilda, wife of the German king, Henry I. the Fowler, without any success.

WIEDEMANN, GUSTAV HEINRICH (1826-1890), German physicist, was born at Berlin on the 2nd of October 1826. After attending the Cologne gymnazium, he entered the university of Berlin in 1844, and took his doctor's degree there three years later. His thesis on that occasion was devoted to a question in organic chemistry, for he held the opinion that the study of chemistry is an indispensible preliminary to the pursuit of physics, which was his ultimate aim. In Berlin he made the acquaintance of H. von Helmholtz at the house of H. G. Magnus, and was one of the founders of the Berlin Physical Society. In 1854 he left Berlin to become professor of physics in Basel University, removing nine years afterwards to Brunswick Polytechnic, and in 1866 to Karlsruhe Polytechnic. In 1871 he accepted the chair of physical chemistry at Leipzig. The attention he had paid to chemistry in the earlier part of his career enabled him to hold his own in this position, but he found his work more congenial when in 1885 he was transferred to the professorship of physics. He died at Leipzig on the 24th of March 1890. His name is probably most widely known for his literary work. In 1877 he undertook the editorship of the Annalen der Physik und Chemie in succession to J. C. Poggendorff, thus starting the series of that scientific periodical which is familiarly cited as Wied. Ann. Another monumental work for which he was responsible was Die Lehre von der Elektricität, or, as it was called in the first instance, Lehre von Galvanismus und Elektronomagnetismus, a book that is unsurpassed for accuracy and comprehensiveness. He produced the first edition in 1861, and a fourth, revised and enlarged, was only completed a short time before his death. But his original work was also important. His data for the thermal conductivity of various metals were for long the most trustworthy at the disposal of physicists, and his determination of the ohm in terms of the specific resistance of mercury showed remarkable skill in quantitative research. He carried out a number of magnetic investigations which resulted in the discovery of many interesting phenomena, some of which have been rediscovered by others; they related among other things to the effect of mechanical strain on the magnetic properties of the magnetic metals, to the relation between the chemical composition of compound bodies and their magnetic properties, to the nature of the laws of torsion and of magnetism. He also investigated electrical endosmosis and the electrical resistance of electrolytes. His eldest son, Eilhard Ernst Gustav, born at Berlin on the 1st of August 1852, became professor of physics at Erlangen in 1886, and his younger son, Alfred, born at Berlin on the 18th of July 1856, was appointed to the extraordinary professorship of Egyptology at Bonn in 1892.

WIELAND, CHRISTOPH MARTIN (1733-1813), German poet and man of letters, was born at Oberholzheim, a village near Biberach, on the 11th of September 1733. His father, who was pastor in Oberholzheim, and subsequently in Biberach, took great pains with the child's education, and from the town school of Biberach he passed on, before he had reached his fourteenth year, to the gymnasium at Klosterberge, near Magdeburg. He was a precocious child, and when he left school in 1749 was widely read in the Latin classics and the leading contemporary French writers; amongst German poets his favourites were Brokes and Klopstock. While at home in the summer of 1750, he fell in love with a kinswoman, Sophie Gutermann, and this love affair seems to have acted as an incentive to poetic composition; under this inspiration he planned his first ambitious work, Die Natur der Dinge (1752), an didactic poem in six books. In 1750 he went to the university of Tübingen as a student of law, but his time was mainly taken up with literary studies. The poems he wrote at the university—Hermann, an epic (published by F. Muncker, 1838), Zwolf moralische Briefe in Versen (1752), Anti-Ovid (1752)—are pietistic in tone and dominated by the influence of Klopstock. They attracted the attention of the Swiss literary reformer, J. J. Bodmer, who invited Wieland to visit him in Zürich, and during the summer of 1755 he stayed in Zürich. After a few months, however, Bodmer felt himself as little in sympathy with Wieland as, two years earlier, he had felt himself with Klopstock, and the friends parted; but Wieland remained in Switzerland until 1760, residing, in the last year, at Bern where he obtained a position as private tutor. Here he stood in intimate relations with Rousseau's friend Julie de Bondelni. Meanwhile a change had come over Wieland's tastes; the writings of his early Swiss years—Der geprüfte Abraham (1753), Sympathien (1756), Empfindungen eines Christen (1757)—were still in the manner of his earlier writings, but with the tragedies, Lady Johanna Gray (1758), and Clementina von Porretta (1760)—the latter based on Richardson's Sir Charles Grandison—the epic fragment Cyrus (1759), and the "moral story in dialogues," Araspes und Panthea (1760), Wieland, as Lessing said, "forsook the ethical spheres to wander again amongst the sons of men.

Wieland's conversion was completed at Biberach, whither he had returned in 1760, as director of the chancery. The dullness and monotony of his life here was relieved by the friendship of a Count Stadion, whose library in the castle of Warthausen, not far from Biberach, was well stocked with French and English books. Here, too, Wieland met again his early love Sophie Gutermann, who had meanwhile become the wife of Hofrat La Roche, then manager of Count Stadion's estates. The former poet of an austere piety now became the advocate of a light-hearted philosophy, from which frivolity and sensuality were not excluded. In Don Sylvio von Rosalta (1761), a romance in imitation of Don Quijote, he held up to ridicule his earlier faith and in the Komische Erzählungen (1763) he gave his extravagant imagination only too free a rein. More important is the novel Geschichte des Agathon (1760-1767), in which, under the guise of
a Greek fiction, Wieland described his own spiritual and intellectual growth. This work, which Lessing recommended as "a novel of classic taste," marks an epoch in the development of the modern psychological novel. Of equal importance was Wieland's translation of twenty-two of Shakespeare's plays into prose (8 vols., 1762-1766); it was the first attempt to present the English poet to the German people in something approaching entirety. With the poems Musaion oder die Philosophie der Grazen (1768), Idris (1768), Combatus (1770), Der neue Amonid (1771), Wieland opened the series of light and graceful romances in verse which appealed so irresistibly to his contemporaries and acted as an antidote to the sentimental excesses of the subsequent Sturm und Drang movement. Wieland married in 1760; his letters and journals of this period are lost, but his professorship of Latin at Erfurt. In the last-mentioned year he published Der goldene Spiegel oder die König von Schlesien, a pedagogic work in the form of oriental stories; this attracted the attention of duchess Anna Amalie of Saxe-Weimar and resulted in his appointment as tutor to her two sons, Karl August and Konstantin, at Weimar. With the exception of some years spent at Ossmannstedt, where in later life he bought an estate, Weimar remained Wieland's home until his death on the 28th of January 1813. Here, in 1773, he founded Der deutsche Merkur, which under his editorship (1773-1782) became the most important literary journal in Germany. Of the writings of his later years the most important, are the admirable satire on German provinciality—the most attractive of all his prose writings—Die Adleriten, eine sehr wahrhaftige Geschichte (1774), and the charming poetic romances, Das Wintermärchen (1776), Das Sommermärchen (1777), Geron der Adelige (1777), Die Wünsche oder Pervonte (1778), a series culminating with Wieland's poetic masterpiece, the romantic epic of Oberon (1780). Although belonging to a class of poetry in which modern readers take but little interest, Oberon has still, owing to the facile beauty of its stanzas, the power to charm. In Wieland's later novels, such as der Geheime Geschichte des Philosophen Peregrinus Prealeus (1791) and Aristipp und einige seiner Zeitgenossen (1800-1802), a didactic and philosophic tendency obscures the small literary interest they possess. He also translated Horace's Saites (1786), Lucian's Works (1788-1789), Cicero's Letters (1808 fl.), and from 1796 to 1803 he edited the Artisches Museum which did valuable service in popularizing Greek studies.

Without creating a school in the strict sense of the term, Wieland succeeded considerably the German literature of his time. The verse-romance and the novel—more especially in Austria—benefited by his example, and even the Romanticists of a later date borrowed many a hint from him in their excursions into the literatures of the south of Europe. The qualities which distinguish his work, its fluent style and light touch, his careless frivility rather than poetic depth, show him to have been in literary temperament more akin to Ariosto and Voltaire than to the more spiritual and serious leaders of German poetry; but these very qualities in Wieland's poetry introduced a balancing element into German classical literature and added materially to its fullness and completeness.

Editions of Wieland's Sämtliche Werke appeared in (1794-1802, 45 vols.), (1818-1828, 53 vols.), (1839-1840, 36 vols.), and (1853-1856, 36 vols.). The present edition (49 vols., 1878-1882) was edited by H. Windakiewicz (1878-1882); a new critical edition is at present in preparation by the Prussian Academy. There are numerous editions of selected works, notably by H. Pröhle in Kürschners Deutsche Nationalliteratur (vols., 54-56, 1883-1889); by E. Muncker (5 vols., 1886); by W. Bölche (4 vols., 1902). Collections of Wieland's letters were edited by his son Ludwig (1815) and by H. Gesner (1815-1816); his speeches and private letters by K. Soppe, L. Hildebrandt, and L. Corrard (1856); C. M. Wieland's Letters (4 vols., 1827-1828); Düring, C. M. Wieland (1853); J. L. Loebell, C. M. Wieland (1882); H. Pröhle, Wieland, Studien, Heine (1876); L. F. Oetterling, Wielands Leben und Werke in Schlesien und in der Schweiz (1877); H. Keil, Wieland und Reinhold (1885); F. Thalmeyr, Über Wielands Klassizismus, Sprache und Stil (1894); M. Doll, Wieland und die Antike (1896); C. A. Debmer, Sterne und Wieland (1896); W. Lenz, Wieland's Verhältniszus Speyer, Pape und Swift (1906); L. Hildebrandt, Beziehungen zu den deutschen Romantikern (1904). See also M. Koch's article in the Allgemeine deutsche Biographie (1897).
of the emperor Maximilian I., who was born here in 1450. The parish church, with its two lofty towers, is substantially a Romanesque building of the 13th century, but the choir and transepts are Gothic additions of a later date. The late Gothic church of the old Cistercian abbey contains a handsome monument in memory of Leonora of Portugal (d. 1467), consort of the emperor Frederick III., and possesses a rich library and an interesting museum. The town-house is also a noteworthy building and contains large and important archives. The chief industrial establishments are a large ammunition factory and an engine factory; but manufactures of cotton, silk, velvet, pottery, and paper are also extensively carried on. Trade is also brisk, and is facilitated by a canal connecting the town with Vienna, and used chiefly for the transport of coal and timber.

Neustadt was founded in 1192, and was a favourite residence of numerous Austrian sovereigns, acquiring the title of the "ever-faithful town" (die altezeit getreue Stadt) from its unfailing loyalty. In 1246 it was the scene of a victory of the Hungarians over the Austrians; and in 1246 it was taken by Matthias Corvinus, king of Hungary, who, however, restored it to Maximilian I. four years later. In 1520 and 1523 it was besieged by the Turks. It was at Neustadt that the emperor Rudolf II. granted to the Bohemian Protestants, in 1600, the "Majestätis-brief," or patent of equal rights, the revocation of which helped to precipitate the Thirty Years' War.

WIENIAWSKI, HENRI (1835-1886), Polish violinist and composer, was born at Lublin, in Poland, on the 10th of July 1835. He was a pupil of the Paris Conservatoire from 1843 to 1846, and again in 1849-1850. Meanwhile he had given concerts in his native country and in Russia, and in 1850 entered upon the career of a travelling virtuoso, together with his brother Joseph, a distinguished pianist. He was appointed solo violinist to thezar in 1860, and taught in the Conservatoire of St. Petersburg from 1862 to 1867. He went on tour again in 1872 with Rubinstein in America, and on his return in 1874 was appointed to succeed Vieuxtemps as professor in the Brussels Conservatoire; but, like his predecessor, he was compelled through ill-health to give up the post after three years, returning to a public career in spite of his illness, until his death, which occurred in a hospital in Paris. It was in the Magazines of Nachod and of the Wonderland Symphony and in the Silesian Sinfonia, which were immensely popular, that his compositions were performed with the greatest success. He also invented the bass tuba or bombardin order to give greater richness and power to the bass parts. In recognition of these inventions he was, in 1835, honoured by the Royal Academy of Berlin. In 1838 he was appointed by the Prussian government director-general of all the guards' bands, and in recognition of the magnificent performance by massed bands on the occasion of the emperor Nicholas I.'s visit the same year, was awarded a special uniform. In 1843 he became director-general of the bands of the 10th Confederate army corps, and from this time exercised a profound influence on the development of military music throughout Germany, and beyond. He was the first to arrange the symphonies and overtures of the classical masters for military instruments, and to organize those outdoor performances of concert pieces by military bands which have done so much to popularize good music in Germany and elsewhere. The performance arranged by him of Beethoven's "Battle of Vittoria," in which the bugle calls were given by trumpeters stationed in various parts of the garden and the cannon shots were those of real guns, created immense sensation. Besides the great work he accomplished in Germany, Wieprecht, in 1847, reorganized the military music in Turkey and, in 1852, in Guatemala. He composed military symphonies and a large number of solo instrumental works, and distributed them frequently on his favourite subject to the Berlin musical papers. He died on the 4th of August 1872. Wieprecht was a man of genial, kindly and generous nature, and was associated with many charitable foundations established for the benefit of poor musicians.

WIESBADEN, a town and watering-place of Germany, in the Prussian province of Hesse-Nassau. Pop. (1905) 100,053. It is delightfully situated in a basin under the well-wooded southwestern spur of the Taunus range, 5 m. N. of Mainz, 3 m. from the right bank of the Rhine (at Biebrich), and 25 m. W. of Frankfort-on-Main by rail. The town is on the whole sumptuously built, with broad and regular streets. Villas and gardens encircle it on the north and east sides and extend up the hills behind. Its prosperity is mainly due to its hot springs and mild climate, which have rendered it a favourite winter as well as summer resort. The general character of the place, with its numerous hotels, pensions, bathing establishments, villas and places of entertainment, is largely determined by the requirements of visitors, who in 1907 numbered 150,000. The principal buildings are the royal palace, built in 1857-1870 as a residence for the Duchess of Nassau, and now a residence of the king of Prussia; the Court Theatre (erected 1829-1829); the new Kurhaus, a large and handsome establishment, with colonnades, adjoining a beautiful and shady park; the town-hall, in the German Renaissance style (1884-1888); the government offices and the museum, with a picture gallery, a collection of antiquities, and a library of 150,000 vols. Among the churches, which are all modern, are the Protestant Marktkirche, in the Gothic style with five towers, built 1533-1862; the Bergkirche; the Roman Catholic church of St. Boniface; the Anglican church and the Russian church on the Rhine (at Biebrich). There are two synagogues. Wiesbaden contains numerous scientific and educational institutions, including a chemical laboratory, an agricultural college and two musical conservatories.

The alkaline thermal springs contain 3% of common salt, and smaller quantities of other chlorides; and a great deal of their efficacy is due to their high temperature, which varies from 150° to 160° Fahr. The water is generally cooled to 93° F. for bathing. The principal spring is the Kochbrunnen (130° F.), the water of which is drunk by sufferers from chronic dyspepsia and obesity. There are twenty-eight other springs of nearly identical composition, many of which are used for bathing, and are efficacious in cases of rheumatism, gout, nervous and female disorders and skin diseases. The season lasts from April to October, but the springs are open the whole year through and are also largely attended in winter.

Two miles north-west of the town lies the Neroberg (860 ft.), whence a fine view of the surrounding country is obtained, and which is reached by a funicular railway from Beausite, and 6 m. to the west lies the Hohe Wurzel (2025 ft.) with an outlook tower.
Wiesbaden is one of the oldest watering-places in Germany, and may be regarded as the capital of the Taunus spas. The springs mentioned by Pliny (Hist. nat. xii. 2) as Fontes Malthisici were known to the Romans, who fortified the place c. 11 B.C. The massive walls in Wiesbaden were the first to wear the Galericulum, which was probably part of the fortifications built under Diocletian. The name Wissbadu ("meadow bath") appears in 830. Under the Carolingian monarch it was the site of a palace, and Otto I. gave it civil rights. In the 11th century the town and district passed to the counts of Nassau, fell to the Walram line in 1255, and in 1355 Wiesbaden became with Idstein capital of the county Nassau-Idstein. It suffered much from the ravages of the Thirty Years’ War and was destroyed in 1644. In 1744 it became the seat of government of the principality Nassau-Utzen, and was from 1815 to 1866 the capital of the duchy of Nassau, when it passed with that duchy to Prussia. Though the springs were never quite forgotten, they did not attain their greatest repute until the close of the 18th century. From 1771 to 1873 Wiesbaden was a notorious gambling resort; but in the latter year public gambling was suppressed by the Prussian government.

WIG (short for “periwig”), an alternative form of “peruke,” Fr. perruque; cf. Span. peluca; conjecturally derived from Lat. pilus), an artificial head of hair, worn as a personal adornment, disguise or symbol of office. The custom of wearing wigs is of great antiquity. If, as seems probable, the curious head-covering of a prehistoric ivory carving of a female head found by M. Piette in the cave of Brazemoupy in the Landes represents a wig (see Ray Lankester, Science from an Easy Chair, fig. 7) the fashion is certainly some 100,000 years old. In historic times wigs were worn among Egyptians, as a sort of official head-dress, and specimens of these have been recovered from mummies. In Greece they were used by both men and women, the most common name being πυργις or ψευδες, sometimes πρόπλωμα or κώμα πρόπλωθος. A reference in Xenophon (Cyr. i. 3. 2) to the false hair worn by Cyrus’s grandfather “as is customary among the Medes,” and also a story in Aristotle (Onon. 4. 14), would suggest that wigs were introduced from Persia, and were in use in Asia Minor. Another origin is suggested by Athenaeus (xii. 523), who says that the Iapgyian immigrants into Italy from Crete, in the 8th century, wore a ψευδες, and the elaborately trussed hair worn by some of the figures in the frescoes found at Cnosus makes it probable that the wearing of artificial hair was known to the Cretans. Lucian, in the 2nd century, mentions wigs of both men and women as a matter of course (Alex. 59, Dial. mer. 11). The theatrical wig was also in use in Greece, the various comic and tragic masks having hair suited to the character represented. A. E. Haigh (Altie Theatre, pp. 221, 239) refers to the black hair and heard of the tyrant, the fair curls of the youthful hero, and the red hair characteristic of the dishonest slave of comedy. These conventions appear to have been handed on to the Roman theatre.

At Rome wigs came into use certainly in the early days of the empire. They were also known to the Carthaginians; Polybius (iii. 78) says that Hannibal used wigs as a means of disguise. The fashionable ladies of Rome were much addicted to false hair, and we learn from Ovid, Amores, i. 14. 45 and Martial (v. 68) that the golden hair imported from Germany was most favoured. Juvenal (vi. 120) shows us Messalina assuming a yellow wig for her visits to places of ill-fame, and the scholar on the passage says that the yellow wig was characteristic of courtresses. The chief names for wigs were golares, galericum, corymbium, capillamentum, calidarium, or even conce emplum, &c. Galerius meant in the first place a skull-cap, or coif, fastening under the chin, and made of hide or fur, worn by peasants, athletes and gladiators. The first men’s wigs then would have been tight-fitting caps simulating hair, which would naturally suggest wigs of false hair. Otho wore a wig (Suetonius, Otho § 12), which could not be distinguished from real hair, while Nero ( Dio Cass. lxix. 9) wore a wig as a disguise, and Heliogabalus also were one at times (Ibid. xlix. 13). A wig was under Charles Anne Bourbon, dukes of different colours as part of their ordinary wardrobe, and Faustina, wife of Marcus Aurelius, is said to have had several hundred. An amusing development of this is occasionally found in portrait busts, e.g. that of Plautilla in the Louvre, in which the hair is made movable, so that by changing the wig of the statue from time to time it should never be out of fashion.

The Fathers of the Church violently attacked the custom of wearing wigs, Tertullian (De cultu fem. C. 7) being particularly eloquent against them, but that they did not succeed in stamping out the custom was proved by the finding of an auruban wig in the grave of a Christian woman in the cemetery of St Cyranus. In 672 a synod of Constantinople forbade the wearing of artificial hair.

Artificial hair has presumably always been worn by women when the fashion required abundant locks. Thus, with the development of elaborate coiffures in the 16th century, the wearing of false hair became prevalent among ladies in Europe; Queen Elizabeth had eighty attires of false hair, and Mary Queen of Scots was also in the habit of varying the attires of hair she wore. The periwig of the 16th century, however, merely simulated hair, either as an adornment or to cover the defects of nature. It was not till the 17th century that the periwig was worn as a distinctive feature of costume. The fashion started in France. In 1620 the abbé La Rivière appeared at the court of Louis XIII. in a periwig made to simulate long fair hair, and four years later the king himself, prematurely bald, also adopted one and thus set the fashion. Louis XIV., who was proud of his abundant hair, did not wear a wig till after 1670. Meanwhile, his courtiers had continued to wear wigs in imitation of the royal hair, and from Versailles the fashion spread through Europe. It was at the court of the duke of Marlborough, the Prince of Wales (Charles I.), while in Paris on his way to Spain, that he had “shadowed himself the most he could under a burlly perruque, which none in former days but bald-headed people used,” he had dropped the fashion on returning to England, and he and his Cavaliers were distinguished from the “Roundheads” only by wearing their own flowing locks. Under Charles II. the wearing of the periuke became general. Pepys records that he parted with his own hair and “ paid £3 for a periwig;” and on going to church in one he says “ it did not prove so strange as I was afraid it would. Quotidian hair, either as an adornment or to cover the defects of nature. It was not till the 17th century that the periwig was worn as a distinctive feature of costume. The fashion started in France. In 1620 the abbé La Rivière appeared at the court of Louis XIII. in a periwig made to simulate long fair hair, and four years later the king himself, prematurely bald, also adopted one and thus set the fashion. Louis XIV., who was proud of his abundant hair, did not wear a wig till after 1670. Meanwhile, his courtiers had continued to wear wigs in imitation of the royal hair, and from Versailles the fashion spread through Europe. It was at the court of the duke of Marlborough, the Prince of Wales (Charles I.), while in Paris on his way to Spain, had “shadowed himself the most he could under a burlly perruque, which none in former days but bald-headed people used,” he had dropped the fashion on returning to England, and he and his Cavaliers were distinguished from the “Roundheads” only by wearing their own flowing locks. Under Charles II. the wearing of the periuke became general. Pepys records that he parted with his own hair and “ paid £3 for a periwig;” and on going to church in one he says “ it did not prove so strange as I was afraid it would. Quotidian hair, either as an adornment or to cover the defects of nature. It was not till the 17th century...
This differentiation of wigs according to class and profession explains why, when early in the reign of George III. the general fashion of wearing wigs began to wane and die out, the practice held its own among professional men. It was by slow degrees that doctors, soldiers and clergymen gave up the custom. In the Church it survived longest among the bishops, the wig ultimately becoming a sort of ensign of the episcopal dignity. Wigs were first discarded by the bishops, by permission of the king, at the coronation banquet of William IV., the weather being hot; and Greville comments on the odd appearance of the prelates with their cropped polls. At the coronation of Queen Victoria the archbishop of Canterbury, alone of the prelates, still wore a wig. Wigs are now worn as part of official costume only in the United Kingdom and its dependencies, their use being confined, except in the case of the speaker of the house of commons and the Speaker of the house of lords, to the members of the lower and upper chamber, the judges and members of the bar (see Robert). Wigs of course continue to be worn by many to make up for natural deficiencies; and on the stage the wig is, as in all times, an indispensable adjunct. Many of the modern stage wigs are made of jute, a fibre which lends itself to marvellously perfect imitations of human hair.

See F. W. Fairholt, Costume in England, 2 vols., ed. Dillon (1887); C. W. Fairholt, The Dress of the People in England (1891); the articles "Coma" and "Galerus" in Darenberg and Saglio's Dictionnaire des antiquités. There is an admirable article on wigs and wig-making in Diderot's Encyclopédie (1765), t. xii., p. 1."Perruques, ou l'art du pelage. École de Paris 60,764.

WIGAN, a market town, and municipal, county and parliamentary borough of Lancashire, England; 154 m. N.W. by N. from London by the London & North-Western railway, served also by the Lancashire & Yorkshire and the Great Central railways. Pop. (1891) 55,013, (1901) 60,764. It lies on the small river Douglas, which flows into the estuary of the Ribble. There is connexion by canal with Liverpool, Manchester, &c. The older portions of the town occupy the north bank of the river, the new additions being chiefly on the south bank. The church of All Saints, late Perpendicular, consisting of chancel with aisles and two chasels, was restored in 1850 and in modern times. There are numerous modern churches and chapels. The principal public buildings are the Royal Albert Edward Infirmary and Dispensary, the public hall, the borough courts and offices, the arcade, the market hall, the free public library and the county courts and offices (1888). The educational institutions include the free grammar school (founded by James Leigh in 1619 and rebuilt in 1876), the Wigan and District Mechanics' Institute and the Wigan Savings Bank (both by public subscription and opened in 1903) and the mechanics' institution, the night school of Notre Dame (1854), with a college for pupil teachers and a high school for girls, and several Roman Catholic schools. A public park of 27 acres was opened in 1878. The town owes much of its prosperity to its coal mines, which employ a large proportion of the inhabitants and supply the factory furnaces. The chief manufacture is that of cotton fabrics; the town also possesses iron foundries, iron and brass foundries, oil and grease works, railway wagon factories, and bolt, screw and nail works. The parliamentary borough, returning one member since 1855, lies on a level plain near the middle of the county, and is divided into five wards, which form five parliamentary divisions. The county borough was created in 1888. The corporation consists of a mayor, 10 aldermen and 30 councillors. Area 5682 acres, including the former urban district of Pemberton (pop. 21,564 in 1901), which was included with Wigan in 1904.

Roman remains have been found, and it is probable that the town covers the site of a Roman post or fort, Coccium. Wigan, otherwise Wygan and Wigham, is not mentioned in Domesday Book, but three of the townships, Upholland, Dalton and Orrell are named. After the Conquest Wigan was part of the former barony of Newton, and the church was endowed with a carucate of land, the origin of the manor. Some time before Henry III.'s reign the baron of Newton granted to the rector of Wigan the manorial privileges. In 1246 Henry III. granted a charter to the famous John Mansel, parson of the church, by which Wigan was constituted a free borough and the burgesses permitted to have a Guild Merchant. In 1240 John Mansel granted by charter to the burgesses that each should have five roods of land to his burgage as freehold on payment of 12d. each. Confirmations and extensions of Henry III.'s charter were granted by Edward I. (1294), Edward III. (1340), Richard II. (1358), Henry IV. (1405), Henry V. (1413), Charles II. (1663), James II. (1685) and William IV. (1832 and 1836). In 1258 Henry III. granted by charter to John Mansel a weekly market on Monday and two fairs, each of three days, beginning on the eve of Ascension Day and on the eve of All Saints' Day, October 28th. Edward II. granted a three days' fair from the eve of St Wilfrid instead of the All Saints' fair, but in 1329 Edward III. by charter altered the date again to its original date. Charles II.'s charter granted, and James II.'s confirmed, a three days' fair beginning on the 28th of April. The Pottage fair was granted by Charles II. on the 7th of May, and also the Christmas fair. Under the Act of Trade 1661 Lord Derby landed from the Isle of Man and marched through Preston to Wigan on the way to join Charles II. At Wigan Lane on the 25th of August a fierce battle took place between the Royalist forces under Lord Derby and Sir Thomas Tyldesley and the Parliamentarians under Colonel Lilburne, in which the Royalists were defeated, Tyldesley was killed and Lord Derby wounded. During the rebellion of 1745 Prince Charles Edward spent one night (December 10th) here on his return march. In 1795 Wigan returned two members to parliament and again in 1837, the right then remaining in the hands of the new borough. In 1754, but from that time till 1885, except during the war, the borough returned one member, and since 1885 one member. The church of All Saints is of Saxon origin, and was existing in Edward the Confessor's time. The list of rectors is complete from 1109.

WIGONIE, or WIGONIE (Fr. Vigneon, from the Lat. Vipio), also called locally "Whewer" and "Whew" (names imitative of the whistling call-note of the male), the Anas penelope of Linnaeus and Marcus penelope of modern ornithologists, one of the most abundant species of ducks throughout the greater part of Europe and northern Asia, reaching northern Africa and the Crimea in winter. A good many pairs breed in the north of Scotland; but the number of the vast numbers which winter in the waters of temperate Europe are in Lapland or farther to the eastward. Comparatively few breed in Iceland.

Intermediate in size between the teal and the mallard, and less showy in plumage than either, the drake wigeon is a beautiful bird, both the greater part of his bill black, his eye red and his head neck chestnut, 2 replaced by greyish pink below and above by lavender grey, which last produced by the transverse undulations of fine black and white lines, extends over the back and along surface of the wing and bell of lining of the coverts, which are 1

1 So Pigeon (an) from Pippa. Other French names, more or less local, are, according to Rolland, Vignie, Vignieon, Vigneon, Vignie, Wigon, Wignet, Winful, Visou and Digene. In some parts of England the small teasling flies, generally called mites, are known as wigeon-mites. 2 Hence come the additional local names "bald-pate" and "red-head."
conspicuously white, and shows itself again on the flanks. The wings are further ornamented by a glossy green speculum between two blue bands. The female is spotted on the flanks; the rest of her plumage is white. The female has the inconspicuous coloration characteristic of her sex among most of the duck tribe. In habits the wigon differs not a little from most of the Anasinae. It greatly affects tidal waters during the season of its southern migration, and becomes the object of slaughter to hundreds of gunners on the coasts of Britain and Holland; but, when it resorts to inland localities, as it also does to some extent in winter, it does much of its feeding in grassing, or, to use a modern expression, on the pastures which surround the lakes or moors that it selects.

The wigon occurs occasionally on the eastern coast of North America, and not uncommonly, it would seem, on the Pribylov Islands in the Pacific. But the New World has two allied species of its own. One of them, M. americana (a freshly killed example of which was once found in a London market), inhabiting the northern part of that continent, and in winter reaching Central America and the West Indian islands as far as Trinidad, wholly resembles its Old-World congener in habits and much in appearance. But in it the chestnut of the head is replaced by a close speckling of black and buff, the white wing-coverts being wanting, and nearly all the plumage is subduced in tone. The other species, M. sibilatrix, inhabits the southern portion of South America and its islands, from Chile on the west to the Falklands on the east, and is easily recognized by its nearly white head, nape glossy with purple and green, and other differences; while the plumage hardly differs sexually at all. (A. N.)

WIGGIN, KATE DOUGLAS (1857–1914). American novelist, daughter of Robert N. Smith, a lawyer, was born in Philadelphia, Pennsylvania, on the 28th of September 1857. She was educated at Abbott Academy, Andover, Massachusetts, and removed in 1876 to Los Angeles, California. She taught in Santa Barbara College (1877–1878), established in San Francisco the first free kindergartens for poor children on the western coast (1878), and, with the help of her sister, Miss Nora Archibald Smith, and of Mrs Sarah B. Cooper, organized the California Kindergarten Training School (1886). She married, in 1890, Samuel Bradley Wiggins of San Francisco, who died in 1899. In 1895 she married George Christopher Rigs, but continued to write under the name of Wiggins. Her interest in children's education was shown in numerous talks, some written in collaboration with her sister, in both prose and verse. But her literary reputation rests rather on her works of prose fiction, which show a real gift for depicting character and an original vein of humour. The best known of these are: The Birds' Christmas Carol (1888); Penelope's English Experiences (1893); Marm Lisa (1896); Penelope's Progress (1898), being Penelope's experiences in Scotland; Penelope's Irish Experiences (1901); The Diary of a Goose-Girl (1902); and Rebecca of Sunnybrook Farm (1903).

WIGGLESWORTH, MICHAEL (1631–1705). American clergyman, born in England and emigrated to America in 1654, where he resided nearly all his life. He was known as a Unitarian minister especially in the parishes of the north, in the 18th of October 1651. His father, Edward (d. 1653), persecuted for his Puritan faith, emigrated with his family to New England in 1638 and settled in New Haven. Michael studied for a time at a school kept by Ezekiel Cheever, and in 1651 graduated at Harvard, where he was a tutor (and a Fellow) in 1652–1654. Having fitted himself for the ministry, he preached at Charlestown in 1653–1654, and was pastor at Malden from 1656 until his death, though for twenty years or more bodily infirmities prevented his regular attendance upon his duties—Cotton Mather described him as "a little feeble shadow of a man." During this interval he studied medicine and began a successful practice. He was again a Fellow of Harvard in 1697–1705. He died at Malden on the 1th of June 1705. Wigglesworth is best known as the author of The Day of Doom; or a Poetical Description of the Great and Last Judgment (1662). At least two English and eight American editions have appeared, notable among them being that of 1687 (New York), edited by W. H. Burr and including other poems of Wigglesworth, a memoir and an autobiography. For a century this realistic and terrible expression of the prevailing Calvinistic theology was by far the most popular work written in America. Other poems include God's controversy with New England (written in 1662, "in the time of the great drought," and first printed in the Proceedings of the Massachusetts Historical Society for 1781), and Meat out of the Eater; or Meditations concerning the Necessity, End and Usefulness of Afflictions unto God's Children (1660; revised in 1703).

His son, Samuel (1689–1768), also a clergyman, was the author of several prose works and of one poem of merit, "A Funeral Song" (1760). Another son, Edward (1693–1765), was the first professor of Divinity at Harvard (1722–1749), and the author of various theological works; and a grandson, Edward (1712–1794), was the second Hollis professor of Divinity (1795–1797), in which position he was succeeded by Michael Wigglesworth's great-grandson, Rev. David Tappan (1752–1803). See J. W. Deane, Memoir of Rev. Michael Wigglesworth (Boston, 1871).

WIGHT, ISLE OF, an island off the south coast of England, forming part of the county of Hampshire, separated from the mainland by the Solent and Spithead. It is of diamond shape, measuring 22¼ miles from E. to W. and 17½ from N. to S. (extreme). The area is 147 sq. m. The south coast is for the most part cliff-bound and grand, and there is much quietly beautiful scenery both inland and along the northern shores. Although east winds are at times prevalent in winter and spring, and summer breezes may be excessive, the climate, especially in certain favoured spots, is mild and healthy. As a result numerous watering-places have grown up on the coasts.

A range of high chalk downs crosses the island from east to west, terminating seaward in the Culver cliffs and the cliffs near Freshwater respectively. It is breached eastward by the Yar valley, which runs from Bracklesham Bay N.E., in the valley of the river Yar, along a coastal stream in the island, flowing N., and by another Yar, flowing N., in the extreme west. These down reach a height over 700 ft. west of the Medina, but east of it do not greatly exceed 400 ft. The slope northward is gradual. The north-west and north-east coasts, looking over the Solent and Spithead respectively, rise sharply, but hardly even assume the cliff form; they are beautifully wooded, and broken by many picturesque estuaries, such as those of the western Yar and Newtown on the north-west, the Medina opening northward opposite Southampton Water, and Wroxton Creek, and the mouth of the eastern Yar on the north-east. The streams mentioned rise very near the south coast; the western Yar, indeed, so close to it that the high land west of the stream is nearly insulated. A second range of downs in the extreme south, between St Catherine's Point and Dunnsore, reaches the greatest elevation in the island, exceeding 800 ft. in St Catherine's Hill. Below these heights on the seaward side occurs the remarkable tract known as the Undercliff, a kind of terrace formed by the collapse of rocks overlying soft strata (sand and clay) which have been undermined. The upper cliffs of the island are of hard chalk; the lower cliffs are remarkably mild, and many delicate plants flourish luxuriantly. This part of the island especially affords a winter resort for sufferers from pulmonary complaints. Along the south coast the action of small streams on the soft rocks has hollowed out steep gullies or ravines, known as chines. Many of these, though small, are of great beauty; the most famous are Shanklin and Blackgang chines. The western peninsula shows perhaps the finest development of sea-cliffs. Off the westernmost promontory rise three detached masses of chalk, about 100 ft. in height, known as the Needles, exposed to the full strength of the southwesterly gales driving up the Channel. During a storm in 1764 a fourth spire was undermined and fell.

Geology.—The geology of the island possesses many features of interest. Its form has been determined by the simple monoclinal fold which has thrown up the Chalk with a high northward dip, so that it now exists as a narrow ridge running from the Needles eastward to the Culver Cliffs, and from hence northward somewhat south of Carisbrook. On the north side of the ridge the Chalk dips beneath the Tertiaries of the Hampshire Basin. Immediately north of the Chalk the Lower Eocene, Reading beds and London Clay form a narrow parallel strip, followed by a similar strip of Upper Eocene, Bracklesham and Bagshot beds. The remaining northern portion of the island is occupied by fluvo-marine Oligocene strata, including the Headon, Osborne, Bembridge and Hamford beds. The various Tertiary formations are exhibited along the north
coast, and may also be studied to great advantage in White Cliff and Alum Bays. In Alum Bay the vertical disposition of the strata is well shown, and the highly-coloured Bagshot sands and clays form a conspicuous feature. From the excellent coast sections many fossils may be obtained. South of the Chalk ridge that rock has been completely removed by denudation so as to expose the underlying Upper Greensand, which has slipped in many places over the underlying Gault (local name: 'Gault Moraine'). The Greensand formations are excellent. The Lower Greensand formation may be studied in the cliff section from Atherfield Point to Rockend, and in the chine of Shanklin and Blackgang. Beneath the Greensand the Wealden is exposed in the section from Brook to Atherfield, and also, to a much less extent, in Sandown Bay. The Wealden strata have yielded abundant fossil remains of extinct reptiles (Teiuanodon), especially in the neighbourhood of Brook and Cowiezea Chine; and at Brook an extinct forest remains of a great raft of timber floated down and deposited in estuarine mud at the mouth of a great river. At Brook also the characteristic Wealden mollusks, Unio valdensis, occurs abundantly.

Towns, &c.—Newport on the head of the Medina estuary is the chief town; Cowes at the mouth the chief port. The principal resorts of visitors are Cowes (the headquarters of the Royal Yacht Squadron); Ryde on the north-east coast; Sandown, Shanklin and Ventnor on the southern coast; Freshwater Gate on the south-east coast, and in the chine of the Solent. Others are Totland Bay near the mouth of the Solent, Gurnard near Cowes, and Seaview and Bembridge south of Ryde. The principal lines of communication with the mainland are between Cowes and Southampt, Ryde and Portsmouth, and Yarmouth and Lymington. Newport is the chief railway centre, lines running N. to Cowes, W. to Yarmouth and Freshwater, S. to Ventnor, with a branch to Sandown, and E. to Ryde. A direct line connects Ryde, Sandown, Shanklin and Ventnor, and has a branch to St Helen's and Bembridge. There are few industries in the island. The land is chiefly of cultural character, a large proportion being devoted to sheep-grazing. Fishing is carried on to a considerable extent on the south coast—lobsters, crabs and prawns being plentiful. Oyster cultivation has been attempted in the Medina, in Brading Harbour and in the Newtown river. At Cowes shipbuilding is carried on, and timber is grown for the British navy in a part of the ancient forest of Parkhurst, between the Medina and the Solent. The general trade of the island centres at Newport, but in the coast towns the chief occupation of the inhabitants consists in providing for visitors. The island shares in the defences of the Solent, Spithead and Portsmouth, and has an important naval station at Portsmouth. It is divided into two liberties, East and West Medina, excluding the borough of Newport and Ryde; and it forms one petty and special sessional division of the county. The urban districts are Cowes, East Cowes, St Helen's, Sandown, Shanklin and Ventnor. Until 1885 there was one member of parliament for the island and one for the borough of Newport; now, however, there is only one member for the whole island. Episcopally the island has for many centuries belonged to the see of Winchester. Pop. (1891) 78,672; (1901) 82,418.

History.—Among the most interesting relics of the Roman occupation of the Isle of Wight following its conquest by Vespasian in A.D. 43 are the villas at Brading and Carisbrooke, the cemeteries at Newchurch, and the foundations at Combe, Farley, Guildford and between Brixton and Calbourne. The settlement of the island by the Jutes no authentic details are preserved, but in 691 it was annexed by Wulfhere to Wessex and subsequently bestowed on his vassal, the king of Sussex. In 996 it was the headquarters of the Danes, who levied their supplies from the opposite coasts of Hampshire and Sussex. From the 14th to the 16th century the island was continuously under fear of Invasions by the French, who in 1377 burnt Yarmouth and Francheville (the latter being subsequently rebuilt and known as Newtown), and so devastated Newport that it lay uninhabited for two years. In 1419, on a French force landing in the island and demanding tribute in the name of King Richard and Queen Isabella, the islanders replied that the king was dead and the queen sent home to her parents without any such condition of tribute, "but if the Frenchmen's minde were to fight, they will'd them to come up, and no man should let them for the space of five hours, to refresh themselves, but when that time was expired they should have battayle given to them"; a proposition prudently declined by the Frenchmen, who returned to their ships and sailed home again. A more formidable raid was attempted in 1545. A fleet of 25 galleys, and 50 smaller vessels drew up off Brading Harbour, and in spite of the brave defence of the islanders wrought much serious destruction. Wolverton near Brading having lain a ruined site ever since. As a result of this, the last French invasion, an organized system of defence was planned for the island, and forts were constructed at Cowes, Sandown, Freshwater and Yarmouth. During the Civil War of the 17th century the island was almost unanimous in support of the parliament, and Carisbrooke Castle was the prison of Charles I. from 1647 to 1649, and in 1650, in the person of Prince Charles of England and the Duke of Gloucester, the former dying there from the effects of a chill after only a few weeks of captivity.

The lordship of the island was granted by William the Conqueror to William Fitz-Osbern, but escheated to the crown by the treason of Roger, son of William, and was bestowed by Henry I. on Baldwin de Redvers, whose descendant Isabella de Fortibus sold it to Edward I. in 1293 for 6,000 marks. Henceforth the island was governed by wardens appointed by the crown, who in the reign of Henry VII. were styled captains, a title revived in 1839 in the person of Prince Henry of Battenberg. The ancient place of assembly for the freemen of the island was at Shide Bridge near Newport, and at Newport also was held the Knighten Court, in which cases of small debt and trespasses were judged by those who held a knight's fee or part of a knight's fee of Carisbrooke Castle. The feudal tenants held their lands for the service of escorting their lords into and out of the island, and of serving forty days at their own cost in defence of Carisbrooke Castle. In the Domesday Survey twenty-nine mills are mentioned, and salt-works at Boarhunt, Bowcombe, Watchwell and Whitfield. The island quarries have been worked from remote times, that of Alum being the largest at Alum Bay. Alum was collected at Parkhurst Forest in 1579. Alum and sand for glass-making were formerly obtained at Alum Bay. In 1295 the united boroughs of Yarmouth and Newport made an isolated return of two members to parliament. From 1584 the boroughs of Lymington, Newport, Newtown and Yarmouth returned two members each, until under the act of 1832 the two last were disfranchised. By the act of 1868 Lymington and Newport lost one member each, and by the act of 1885 were disfranchised.

Antiquities.—Early antiquities include British pit villages near Rowborough, Celtic tumuli on several of the chalk downs, and the so-called Long Stone at Mottiston, a loft sandstone monolith. The Roman villa near Brading contains some beautiful and well-preserved examples of tessellated pavements. Carisbrooke Castle is a beautiful ruin built upon the site of an ancient British stronghold. There are slight remains of Quarry ABBEY near Ryde, founded for Benedictines (afterwards Cistercians) by Baldwin de Redvers in the first half of the 12th century. The most noteworthy ancient churches are those of Bonchurch (Norman), Brading (transitional Norman and Early English), Shallet (Norman and Decorated), and Carisbrooke, of various styles.

WITGOWN, a royal burgh and the county town of Wigtownshire, Scotland. Pop. (1901) 1329. It is situated on the western
shore of Wigtown Bay—whence the name, from the Scandinavian vik, "bay"—7 m. S. by E. of Newton Stewart by railway. It is built on an eminence around a spacious central area laid out in walks. The Old Church, the ruined church of the Black Machers, and the Lighting House are close together, and at the opposite side are two coves, one of 1738 and the other commemorating Waterloo. Some fishing is carried on. In the old churchover, were buried Margaret MacLachlan, a widow aged 63, and Margaret Wilson, a girl of 18, two covenanting martyrs who were tied to stakes in the sands of Wigtown Bay and drowned by the rising waters (1685), to whose memory, as well as that of three men who were hanged at the same time without trial, an obelisk surmounted by an urn was erected in 1858 on the top of Windy Hill, outside the town. Wigtown was made a royal burgh in 1783.

Wigtownshire (sometimes called West Galloway), a south-western county of Scotland, bounded N. by Ayrshire, E. by Kirkcudbrightshire and Wigtown Bay, S. by the Irish Sea and W. and N. by the North Channel. Including the small island of St Helena, at the head of Luce Bay, it covers an area of 311,669 acres, or 487 sq. m. On the eastern boundary the estuary of the Cree expands into Wigtown Bay, between which and Luce Bay, farther west, extends the promontory of the Machers, terminating in Burrow Head. The indentation of Luce Bay on the south and Loch Ryan on the north the hammerhead of the coast, and the line of which, from Portpatrick to Stranraer, the most southerly point of Scotland, is the southern, and Millepromont the northern extremity. The more or less rugged coast has many small inlets, few of which, owing to hidden rocks, afford secure landing-places. Excepting Loch Ryan, a fine natural harbour of which Stranraer is the port, the harbours are not available for vessels of heavy burden, on account either of the great distance to which the sea retires, or of their exposure to frequent fierce gales. Much of the county has a wild, bleak appearance, the higher land being covered with heath and sand; and while in the lower districts there are long stretches of bog and moss, and in the north centre, a few miles west of Newton Stewart, is a tract known as the Moons. Only towards the Ayrshire border do the hills reach a considerable altitude, Benbroke and Craigairlie being each 1000 ft. in height. The chief rivers are the Cree, forming the boundary with Kirkcudbrightshire and flowing past Newton Stewart and Carty into Wigtown Bay; the Bladenoch, issuing from Loch Mabery and falling into Wigtown Bay at Wigtown after a course of 22 m., its principal affluents, all on the right, being Black Burn, the Tin in and the Lomond Mie; and the Loch Rine, formed by the junction at New Luce of Main Water and Cross Water of Luce, and emptying itself into Luce Bay. Most of the numerous lochs are small, several being situated in private parks, as at the earl of Stair’s estate of Castle Kennedy. Among the larger lakes are Loch Mabery and Loch Dornal, both partly in Ayrshire, and Loch Ochiltree in the north of the shire, Loch Connell in the west. Loch Ronald in the centre and the group of Loch and four others in the parish of Mocharum, towards the south, and Loch Dowalton, at the junction of Kirkinner, Sorbie and Glasserton parishes.

Geology.—A line drawn in a north-easterly direction from the coast about 3 m. below Portpatrick, passing slightly north of the head of Luce Bay by Newton Stewart to the Cairnsmore of Fleet, divides the county so that practically all the rocks on the northern side are Ordovician age, while those on the south are Silurian. This line coincides with the general direction of the strike of the beds throughout the country. Most of the Ordovician rocks are black shales, in which graptolites may be found, along with greywackes and grits; they include the Glenkiln and Hartfell groups of the Moffat district. These rocks may be seen exposed on the coast south of Portpatrick and in the valley of the Cree. The slate quarries of Carn Ryan are of Ordovician age, and the whole of the rocks of the Lomond and the dark grits, greywackes and shales of Llandovery age, though here and there a small exposure of the underlying black Moffat shales appears on the downs. One of these former beds, known as the Llanes, is rich in fish remains, and to this rests unconformably upon a similar belt of Carboniferous sandstones, about 8 m. long and 1 m. wide, in which lies on the west side of the shire. A small patch of granite stands out on the coast at Lagganintoch Head, and there are also a few patches and dikes of diorite and quartz-felsite. Glacial moraines and drumlins are found over much of the older formations, and are well seen between Glenluce and Newton Stewart and south of Stranraer. The Loch Ryan basin is underlain by the same beds as the eastern district, comprising the shire east of the parish of New Luce and Old Luce, and the Upper district, comprising the shire west of and including these parishes. The county is under school-board jurisdiction, and there are high schools in Newton Stewart and Stranraer. The board-schools in Whithorn and Wigtown have secondary departments, and several of the schools in the shire earn grants for higher education. The county

Population and Administration.—In 1891 the population amounted to 36,652; in 1901 to 32,655 or 87 persons to the sq. m., the decrease for the decade being the third highest in Scotland. In 1901 there were 88 persons speaking Gaelic and English. The principal towns are Stranraer (pop. 6093); Newton Stewart (1868), which, however, standing on both banks of the Cree, extends into Kirkcudbrightshire; Wigtown (1369); and Whithorn (1888). Formerly Wigtown, Stranraer and Whithorn formed with New Galloway, in Kirkcudbrightshire, a group of burghs returning one member, but in 1885 the first three were merged in the county, which returns one member to parliament. Wigtown, the county town, Stranraer and Whithorn are royal burghs. The shire forms part of the sheriffdom of Dumfries and Galloway, and a sheriff-substitute sits at Wigtown and Stranraer. The sheriff conspires with the lieutenants of the eastern district, comprising the east of the parishes of New Luce and Old Luce, and the Upper district, comprising the shire west of and including these parishes. The county is under school-board jurisdiction, and there are high schools in Newton Stewart and Stranraer. The board-schools in Whithorn and Wigtown have secondary departments, and several of the schools in the shire earn grants for higher education. The county

WIGWAM—WIHTRED

Kennedy was created earl of Cassillis. Gilbert, the 4th earl, so powerful that he was called the "king of Carrick," held the shire for Mary, queen of Scots, when her husband, the head of the Congregation, but could do little for her cause. He profited by the Reformation himself, however, to acquire by fraud and murder the estate of Glenluce Abbey (about 1570). In 1603 James VI. instituted a bishop in the see of Galloway—which had not been filled for twenty years—and otherwise strove to impose episcopacy upon the people, but the inhabitants stood firm for the Covenant. The acts against Nonconformity were stringently enforced and almost every incumbent in Galloway was deprived of his living. Field-preaching was a capital crime and the law was in force that in attendance on a sermon a reign of terror supervised, and numbers of persons emigrated to Ulster in order to escape persecution. John Graham of Claverhouse, Viscount Dundee, having replaced Sir Andrew Agnew, who had refused the Test, as sheriff (1682), goaded the people into rebellion, the drowning of Margaret MacLachlan and Margaret Wilson within flood-mark in Wigtown Bay (1685) being an instance of his ruthless methods. With the Revolution of 1688 Presbyterianism was restored, and John Gordon, recently consecrated bishop of Galloway, retired to France. The Jacobite risings of 1715 and 1745 excited only languid interest, but in 1747 heritable property was granted to the chiefs of MacCulloch, to be hereditary, though he was the only official able to prove continuous tenure of the post since it was granted to his family in 1451. The first sheriff appointed under the new system was Alexander Boswell, Lord Auchenleck, father of James Boswell, the biographer of Dr Johnson. In 1760 an engagement took place in Luce Bay, when the young French seaman, François Thurot, with three warships, attempting a diversion in Jacobite interests, was defeated and killed with the loss of three hundred men and his vessels.

The ancient castles in Wigtownshire may be mentioned the cliff towers, possibly of Norse origin, of Carhigdon and Castle Feather near Burrow Head; the ruins of Baldoun, south of Wigtown, associated with events which suggested to Sir Walter Scott the romance of The Bride of Lammermoor; Corsewall near the northern extremity of the Rhins; the Norse stronghold of Cruggleton, south of Garliestown, which belonged in the 13th century to de Quincy, Earl of Winchester, who had married a daughter of Alan, "king" of Galloway, and to Alexander Comyn, 2nd Earl of Buchan (d. 1289), his son-in-law; Dunseky, south of Portpatrick, built in the 16th century, occupying the site of an Saxon church, the ancient seat of the MacDonells; Myrton, the seat of the MacCullochs, in Lochrum parish; and the ruined tower of Sorbie, the ancient keep of the Hnnays.

See Sir Herbert Maxwell, History of Dumfriesshire and Galloway (Edinburgh, 1896); Sir Andrew Agnew, The Agnew of Lochan (Edinburgh, 1860); The Galloway Herd-Book (Dumfries, 1880); Proceedings of the Soc. of Ant. of Scotland, passim; Gordon Fraser, Wigtown and Whithorn (Wigtown, 1877).

WIGWAM, a term loosely adopted as a general name for the houses of North American Indians. It is, however, strictly applied to a particular dome-shaped or conical hut made of poles lashed together at the top and covered with bark. The skin tents of many of the Plains Indians are called tipis. The word "wigwam" represents the Europeanized or Anglicized form of the Algokian tekwom-un, i.e., "in his (their) house."

WIHTRED, king of Kent (d. 725), son of Ecgfrith, nephew of Hlothhere and brother of Eadric, came to the Kentish throne in 690 after the period of anarchy which followed the death of the latter king. Bede states that Whithred and Swefheard were both kings in Kent in 692, and this statement would appear to imply that both of East-Saxon influence (Agust) were present, while there is also evidence of an attack by Wessex. Whithred, however, seems to have become sole king in 694. At his death, which did not take place until 725, he left the kingdom to his sons Aethelberht, Eadberht and Alric. After the annal 692 in the Chronicle there is inserted a grant of privileges to the church, which purports to have been issued by Whithred at a place called Baccancelce. This grant, however, cannot be accepted as genuine and
WILBERFORCE, R. I.—WILBERFORCE, S.

has merely an illustrative value, but there is still extant a code of laws issued by him in a council held at a place called Berghamstede (Barham?) during the fifth year of his reign (probably 605).

WILBERFORCE, ROBERT ISAAC (1802-1857), English clergyman and writer, second son of William Wilberforce, was born on the 19th of December 1802. He was educated at Oriel College, Oxford, taking a double first in 1823. In 1826 he was chosen fellow of Oriel and was ordained, among his friends and colleagues being Newman, Pusey and Keble. For a few years he was one of the tutors at Oriel, but the provost, Edward Hawkes, disapproved his religious views, and in 1831 he resigned and left Oxford. In 1832 he obtained the livings of East Farleigh, Kent, which in 1830 he exchanged for that of Burton Agnes, near Hull. In 1831 he was appointed archdeacon of the East Riding. About this time Wilberforce became very intimate with Manning, and many letters on theological and ecclesiastical questions passed between them. In 1837 Manning joined the Church of Rome, and three years later Wilberforce took the same step. He was preparing for his ordination when he died at Albano on the 3rd of February 1857. He left two sons, the younger named Wilberforce, 1834, became one of the masters of the Supreme Court of Judicature. Edward's son, Lionel Robert Wilberforce (b. 1861), was in 1900 appointed professor of physics in the university of Liverpool.

R. J. Wilberforce assisted his brother Samuel to write the Life and to edit the Correspondence of his father. His other writings include: Church Courts and Church Discipline (1843); Doctrine of the Holy Eucharist (1843); Doctrine of the Incarnation in Relation to Mankind and the Church (1848 and later editions); The Five Empires, a Sketch of Ancient History (1850); A Sketch of the History of Erastianism (1851); An Enquiry into the Principles of Church Authority (1854); and a non-fictional work, Battles and Lucius (1842).

WILBERFORCE, SAMUEL (1802-1873). English bishop, third son of William Wilberforce, was born at Clapham Common, London, on the 7th of September 1805. In 1823 he entered Oriel College, Oxford. In the "United Debating Society," which afterwards developed into the "Union," he distinguished himself as a zealous advocate of liberalism. The set of friends with whom he chiefly associated at Oxford were sometimes named, on account of their exceptionally decorous conduct, the "Bethel Union"; but he was by no means averse to amusements, and specially delighted in hurdy-gurdy and hunting. He graduated in 1826, taking a first class in mathematics and a second in classics. After his marriage on the 11th of June 1828 to Emily Sargent, he was in December ordained and appointed curate-in-charge at Checkendon near Henley-on-Thames. In 1830 he was presented by Bishop Sumner of Winchester to the rectory of Brightstone in the Isle of Wight. In this comparatively retired sphere he soon found scope for that manifold activity which so powerfully characterized his subsequent career. In 1831 he published a tract on tithes, "to correct the prejudices of the lower order of farmers," and in the following year a collection of hymns for use in his parish, which had a large general circulation; a small volume of stories entitled the Note Book of a Country Clergyman; and a sermon, The Apostolical Ministry. At the close of 1837 he published the Letters and Journals of Henry Martyn. Although a High Churchman Wilberforce held aloof from the Oxford movement, and in 1838 his divergence from the "Tract" writers became so marked that J. H. Newman declined further contributions from him to the British Critic, not deeming it advisable that they should longer "co-operate very closely." In 1838 Wilberforce published, with his elder brother Robert, the Life of his father, and two years later his father's Correspondence. In 1839 he also published Eucharistica (from the old English divines), to which he wrote an introduction, Agathos and other Sunday Stories, and a volume of University Sermons, and in the following year Rocky Island and other Parables. In November 1839 he was installed archdeacon of Surrey, in August 1840 was collated canon of Winchester and in October he accepted the rectory of Alvestoke. In 1841 he was chosen Hampton lecturer, and shortly afterwards made chaplain to Prince Albert, an appointment he owed to the impression produced by a speech at an anti-slavery meeting some months previously. In October 1843 he was appointed by the archbishop of York to be sub-almoner to the queen. In 1844 appeared his History of the American Church. In March 1847 a remonstrance was drawn up by Wilberforce the dean of the deanery of Westminster, and in October the bishopric of Oxford.

The bishop in 1847 became involved in the Hampden controversy, and signed the remonstrance of the thirteen bishops to Lord John Russell against Hampden's appointment to the bishopric of Hereford. He also endeavoured to obtain satisfactory assurances from Hampden; but, though unsuccessful in this, he withdrew from the suit against him. The publication of a papal bull in 1850 establishing a Roman hierarchy in England brought the High Church party of whom Wilberforce was the most prominent member, into temporary disrepute. The succession to the Church of Rome of his brother-in-law, Archdeacon (afterwards Cardinal) Manning, and then of his brothers, as well as his only daughter and his son-in-law, Mr and Mrs J. H. Pye, brought him under further suspicion, and his revival of the powers of convocation lessened his influence at court; but his unfailing tact and wide sympathies, his marvellous energy in church organization, the magnetism of his personality, and his eloquence both on the platform and in the pulpit, gradually won for him recognition as without a rival on the episcopal bench. His diary reveals a tender and devout private life which has been overlooked by those who have only considered the versatile facility and persuasive expediency that marked the successful public career of the bishop, and earned him the sobriquet of "Soapy Sam." In the House of Lords he took a prominent part in the discussion of social and ecclesiastical questions. He has been styled the "bishop of society"; but society occupied only a fraction of his time. The great bent of his energies was ceaselessly directed to the better organization of his diocese and to the introduction of effective schemes for increasing the intellectual efficiency of the church. In 1854 he opened a theological college at Cuddesdon, which was afterwards the subject of some controversy on account of its alleged Romanist tendencies. His attitude towards Essays and Reviews in 1861, against which he wrote an article in the Quarterly, won him the special gratitude of the Low Church party, and latterly he enjoyed the full confidence and esteem of all except the extreme men of either side and party. On the publication of J. W. Colenso's Commentary on the Romans in 1861, Wilberforce endeavoured to induce the author to hold a private conference with him; but after the publication of the first two parts of the Penitence Critically Examined he drew up the address of the bishops which called on Colenso to resign his bishopric. In 1867 he framed the first Report of the Ritualistic Commission, in which coercive measures against ritualism were disavocated by the use of the word "restrain" instead of "abolish" or "prohibit.

He also endeavoured to take the sting out of some resolutions of the second Ritualistic Commission in 1868, and was one of the four who signed the Report with qualifications. Though strongly opposed to the disestablishment of the Irish Church, yet, when the constituencies decided for it, he advised that no opposition should be made to it by the House of Lords. After twenty-four years' labour in the diocese of Oxford, he was translated by Gladstone to the bishopric of Winchester. He was killed on the 10th of July 1873, by the shock of a fall from his horse near Dorking, Surrey.

Wilberforce left three sons. The eldest, Reginald Gorton Wilberforce, being the author of An Unrecorded Chapter of the English Church in the Restoration (1905). His two younger sons both attained distinction in the English church. Ernest Roland Wilberforce (1840-1908) was bishop of Newcastle-on-Tyne from 1882 to 1895, and bishop of Chichester from 1895 till his death. Albert Basil Orme Wilberforce (b. 1841) was appointed canon residuary of Westminster in 1884, chaplain of the House of Commons in 1896 and archdeacon of Westminster in 1900; he has published several volumes of sermons.
Besides the works already mentioned, Wilberforce wrote "Heroes of British liberality," (1810), of which four volumes were published, and several volumes of sermons. See Life of Samuel Wilberforce, with Selections from his Diary and Correspondence (1879-1882), vol. i., ed. by Canon A. R. Ashwell, and vol. ii. and iii., ed. by his son H. W. Wilberforce, whio became president of Queens' College, Cambridge, in 1888. One of the volumes of the "English Leaders of Religion" is devoted to him, and he is included in Dean Burgon's Lives of Twelve Good Men (1888).

WILBERFORCE, WILLIAM (1759-1833). English philanthropist whose name is chiefly associated with the abolition of the slave trade, was descended from a Yorkshire family which possessed the manor of Wilberfoss in the East Riding from the time of Henry II till the middle of the 18th century. He was the only son of Robert Wilberforce, member of a commercial house at Hull, by his wife Elizabeth, daughter of Thomas Bird of Barton, Oxon, and was born at Hull on the 24th of August 1759. It was from his mother that he inherited both his feeble frame and his many rich mental endowments. He was not a diligent scholar, but at the grammar school of Hull his skill in elocution attracted the attention of the master. Before he had completed his tenth year he lost his father and was transferred to the care of a paternal uncle at Wimbledon; but in his twelfth year he returned to Hull, and soon afterwards was placed under the care of the master of the endowed school of Pocklington. Here his love of social pleasures made him neglectful of his studies, but he entered St John's College, Cambridge, in October 1766. Left by the death of Quen's, his grandfather, a wealthy and independent fortune under his mother's sole guardianship, he was somewhat idle at the university, though he acquitted himself in the examinations with credit; but in his serious years he "could not look back without unfeigned remorse" on the opportunities he had then neglected. In 1780 he was elected to the House of Commons for his native town, his success being due to his personal popularity and his lavish expenditure. He soon found his way into the fast political society of London, and at the club at Gossetrees renewed an acquaintance begun at Cambridge with Pitt, which ripened into a friendship of the closest kind. In the autumn of 1783 he set out with Pitt on a tour in France; and after his return his eloquence proved of great assistance to Pitt in his struggle against the majority of the House of Commons. In 1784 Wilberforce was elected for both Hull and Yorkshire, and took his seat for the latter constituency.

A journey to Nice in the autumn of the same year with his friend Dr Isaac Milner (1750-1829), who had been a master at Hull grammar school when Wilberforce was there as a boy, and had since made a reputation as a mathematician, and afterwards became a member of the committee for the enclosure of Carlisle, led to his conversion to Evangelical Christianity and the adoption of more serious views of life. The change had a marked effect on his public conduct. In the beginning of 1787 he busied himself with the establishment of a society for the reformation of manners. About the same time he made the acquaintance of Thomas Clarkson, and began the agitation against the slave trade. Pitt entered heartily into their plans, and recommended Wilberforce to undertake the guidance of the project as a subject suited to his character and talents. While Clarkson was abroad promoting the anti-slavery cause, Wilberforce took every opportunity in the House of Commons of exposing the evils and horrors of the trade. In 1788, however, a serious illness compelled him to retire for some months from public life, and the introduction of the subject in parliament therefore devolved on Pitt, whose representations were so far successful that an act was passed providing that the number of slaves carried in ships should be in proportion to the tonnage. On the 12th of May of the following year Wilberforce, in co-operation with Pitt, brought the subject of abolition again before the House of Commons, but the friends of the planters succeeded in getting the matter deferred. On the 27th of January following Wilberforce carried a motion for referring to a special committee the further examination of witnesses, but after full inquiry the motion for abolition in April 1791 was lost by 163 votes to 88. In the following April he carried a motion for gradual abolition by 238 to 85 votes; but in the House of Lords the discussion was finally postponed till the following session. Notwithstanding his unremitting labours in educating public opinion and annual motion in the House of Commons, it was not till following Pitt's death, that the first great step towards the abolition of slavery was accomplished. When the anti-slavery society was formed in 1823, Wilberforce and Clarkson became vice-presidents; but before their aim was accomplished Wilberforce had retired from public life, and the Emancipation Bill was not passed till August 1833, a month after his death.

In 1797 Wilberforce published A Practical View of the Prevailing Religious System of Professed Christians in the Higher and Middle Classes of this Country Contrasted with Real Christianity, which within half a year went through five editions and was translated into the principal Italian, Dutch and German. In the same year (May 1797) he married Barbara Ann Spooner and took a house at Clapham, where he became one of the leaders of what was known as the "Clapham Sect" of Evangelicals, including Henry Thornton, Charles Grant, E. J. Eliot, Zachary Macaulay and James Stephen. It was in connexion with this group that he then occupied himself with a plan for a religious periodical which should admit "a moderate degree of political and common intelligence," the result being the appearance in January 1821 of the Christian Observer. He Pitt, compelled himself to a large degree, to abandon set up attempts to the establishment of the social and religious welfare of the community, including the establishment of the Association for the Better Observance of Sunday, the foundation, with Hannah More (q.v.), of schools at Cheddar, Somersetshire, a project for opening a school in every parish for the religious instruction of children, a plan for the education of the children of the lower classes, a bill for securing better salaries to curates, and a method for disseminating, by government help, Christianity in India. In parliament he was a supporter of parliamentary reform and of Roman Catholic emancipation. In 1822, after a falling out with the Church Establishment of Yorkshire for the sake of a constituency which would make less demands on his time, and was returned for Bramber, Sussex. In 1825 he retired from the House of Commons, and the following year settled at Highwood Hill, near Mill Hill, "just beyond the disk of the metropolis." He died at London on the 20th of July 1833, and was buried in Westminster Abbey close to Pitt, Fox and Canning. In Westminster Abbey a statue was erected to his memory, and in Yorkshire a county asylum for the blind was founded in his honour. A column was also erected to him by his townsmen of Hull. In 1851 Wilberforce left four sons, three of whom, Samuel and Robert Isaac, are noticed separately. The youngest, Henry William Wilberforce (1807-1873), was educated at Oriel College, Oxford, and was president of the Oxford Union. He took orders in the English Church, but in 1850 became a Roman Catholic. He was an active journalist and edited the Catholic Standard.

The chief authorities of the career of William Wilberforce are his Life (3 vols., 1838) by his sons, Robert Isaac and Samuel, and his Correspondence (1840) also published by his sons. A smaller edition of the Life was published by Samuel Wilberforce in 1868. See also The private papers of William Wilberforce, edited by A. M. Wilberforce (1874); Sir James Stephen, Essays in Ecclesiastical Biography (1849); C. Colerough, Wilberforce, Times, London (1866); John Stoughton, William Wilberforce (1880); J. J. Gurney, Familiar Sketch of Wilberforce (1838); and J. S. Hartford, Recollections of W. Wilberforce (1894).

WILBRANDT, ADOLF (1837—). German novelist and dramatist, was born at Rostock on the 24th of August 1837, the son of a professor at that university. Having received his early education at the gymnasium of his native town, he entered the university and engaged in the study of theology, but he soon abandoned in favour of philology and history, and continued these studies in Berlin and Munich. After taking the degree of doctor of philosophy, he joined the staff of the Süddeutsche Zeitung in Munich. He travelled abroad for a time and in 1871 settled in Vienna, where, two years later, he married the actress, Auguste Baudius. In 1881 Wilbrandt was appointed
WILBYE—WILDE

director of the Hofburg theatre in succession to Franz Dingelstedt, an office he held until 1887. In this year he returned to his native town of Rostock, and remained actively engaged in literary production. Wilbrandt is distinguished both as a dramatist and novelist. His merits were acknowledged by the award of the Grillparzer prize on two occasions—in 1875 for the tragedy Gracchus der Volkstrubun, and in 1890 for his dramatic poem Der Meister von Palmyra, while in 1878 he received the Schiller prize for his dramatic productions.

Among his plays may be mentioned the tragedies, Arria und Messalina (1874), Nero (1876); Kriemhild (1877); the comedies Unerreichtar (1870), Die Moler (1872), Jugendliebe (1873) and Der Kampf ums Dasein (1874); and the drama Die Tochter des Devils Fabricatz (1883). Among his novels the following may be noticed:—Meister Amor (1880); Herrmann Jinger (1892; Der Dormenweg (1894); Die Osterinsel (1895); Die Rothenburger (1895); and Der Ruhm der Truhe (1896). Wilde has long been popular and are included in modern collections of his works.

WILDE, JOHN, English 16th-century madrigal composer, was born probably at Bury St Edmunds, but the details of his life are obscure. A set of madrigals by him appeared in 1598 and a second in 1608, the two sets containing sixty-four pieces; and from a few contributions known to have been made by him to other contemporary sets, we can infer that he was alive in 1614. He is the most famous of all the English madrigalists; his pieces have long been favourites and are included in modern collections of that kind.

WILD, JONATHAN (c. 1682–1729), English criminal, was born about 1682 at Wolverhampton, where his father was a wig-maker. After being apprenticed to a local buckle-maker, he went to London to learn his trade, and, getting into debt, was imprisoned for several years. The acquaintance of many criminals which he made in prison he turned to account after his release by setting up as a receiver of stolen goods. Wild shrewdly realized that it was safer, and in most cases more profitable, to dispose of such property by returning it to its legitimate owners than to sell it, with the attendant risks, in the open market, and he thus built up an immense business, posing as a recaver of stolen goods, the thieves receiving a commission on the price paid for recovery. A special act of parliament was passed by which receivers of stolen property were made accessories to the theft, but Wild’s professed “lost property office” had little difficulty in evading the new law, and became so prosperous that two branch offices were opened. From profiting by robberies in which he had no share, Wild naturally came to arrange robberies himself, and he devised and controlled a huge organization, which plundered London and its approaches wholesale. Such thieves as refused to work with him received short shrift. The notorious Jack Sheppard, wearied of Wild’s exactions, at last refused to deal with him, whereupon Wild secured his arrest, and himself arrested Sheppard’s confederate, “Blueskin.” In return for Wild’s services in tracking down such thieves as he did not himself control, the authorities for some time tolerated the offences of his numerous agents, each a specialist in a particular kind of robbery, and so themselves strengthened his position. If an arrest were made, Wild had a plentiful supply of false evidence at hand to establish his agents’ alibi, and he did not hesitate to obtain the conviction, by similar means, of such thieves as refused to recognize his authority. Such stolen property as could not be returned to the owners with profit was taken away in a slop purchased for this work. At last either the authorities became more strict or Wild less cautious. He was arrested, tried at the Old Bailey, and after being acquitted on a charge of stealing lace, found guilty of taking a reward for restoring it to the owner without informing the police. He was hanged at Tyburn on the 24th of May 1725.

WILDBAD, a watering-place of Germany; in the kingdom of Württemberg, picturesquely situated 1475 ft. above the sea, in the romantic pine-clad gorge of the Enz in the Black Forest, 28 m. W. of Stuttgart and 14 E. of Baden-Baden by rail. Pop. 7063. (1905) 3734. It contains an Evangelical, a Roman Catholic and an English church, and has some small manufactures (cigars, paper and toys). Its thermal alkaline springs have a temperature of 90°-100° Fahr. and are used for bathing in cases of paralysis, rheumatism, gout, neuralgia and similar ailments. The fact that the springs rise within the baths, and are thus used at the fountain-head, is considered to contribute materially to their curative value. The water is used internally for affections of the stomach, intestines and digestive organs, and of the kidneys, bladder, &c. Wildebad possesses all the usual arrangements for the comfort and amusement of the visitors (over 15,000 annually), including large and well-appointed hotels, a Kurhaus, a Trink-Halle and promenades. The neighbourhood is picturesque, the most attractive spot being the Wildsee, of which legends are told.

WILDE, OSCAR F'LAHERTIE WILLS (1856–1900), English author, son of Sir William Wilde, a famous Irish surgeon, was born in Dublin on the 15th of October 1856; his mother, Jane Francisca Elgee, was well known in Dublin as a graceful writer of verse and prose, under the pen-name of “Speranza.” Having distinguished himself in classics at Trinity College, Dublin, Oscar Wilde went to Magdalen College, Oxford, in 1874, and won the Newdigate prize in 1878 with his poem “Ravenna,” besides taking a first-class in classical Moderations and in Literae Humaneores. But his career at Oxford, brilliant intellectually as he showed himself to be, was chiefly signalized by the part he played in what came to be known as the aesthetic movement. He adopted what to undergraduates appeared the effeminate pose of casting scorn on many sports, wearing his hair long, decorating his rooms with peacock’s feathers, lilies, sunflowers, blue china and other objets d’art, which he declared his desire to “live up to,” affecting a lackadaisical manner, and professing intense emotions on the subject of “art for art’s sake”—then a new-fangled doctrine which J. M. Whistler was bringing into prominence. Wilde made himself the apostle of this new cult. At Oxford his behaviour procured him a ducking in the Cherwell, and a wrecking of his rooms, but the cult spread among certain sections of society to such an extent that languishing attitudes, “too-too” costumes and “aestheticism” generally became a recognized pose. Its affectations were burlesqued in Gilbert and Sullivan’s travesty Patience (1881), which practically killed by ridicule the absurdities to which it had grown. At the same time it cannot be denied that the “aesthetic” movement, in the aspect fundamentally represented by the school of William Morris and Rossetti, had a permanent influence on English decorative art. As the leading “aesthet,” Oscar Wilde became one of the most prominent personalities of the day; apart from the ridicule he encountered, his personal paradoxes and his witty sayings were quoted on all sides, and in 1882 he went on a lecturing tour in the United States. In 1884 he married Constance Lloyd. He had already published in 1882 a selection of his poems, which, however, only attracted admiration in a limited circle. In 1888 appeared The Happy Prince and Other Tales, illustrated by Walter Crane and Jacquem Hood. This charming volume of fairy tales was followed up later by a second collection, The House of Pomegranates (1892), acknowledged by the author to be “intended neither for the British child nor the British public.” In much of his writings, and in his general attitude, there was to most people an undertone of rather nasty suggestion which created prejudice against him, and his novel, The Picture of Dorian Gray (1891), with all its sparkle and cleverness, impressed them more from this point of view than from its purely literary brilliance. Wilde contributed some characteristic articles to the reviews, all coloured by his peculiar attitude towards art and life, and in 1891 republished three of them as a book called Intentions. His first novel, with its cleverly phrased and relatively dramatic introduction Lady Windermere’s Fan at the St James’s Theatre in 1893, followed by A Woman of No Importance (1893), An Ideal Husband (1895) and The Importance of Being Earnest (1895). The
WILDEBRUCH—WILDERNESS

633
dramatic and literary ability shown in these plays, all of which were published later in book form, was as undoubtedly as their diction and ideas were characteristically paradoxical. In 1863 the licensor of plays refused a licence to Wilde’s Salome, but it was produced in French in Paris by Sarah Bernhardt in 1894. His success as a dramatist had by this time gone some way to disabuse hostile critics of the suspicions as regards his personal character which had been excited by the apparent looseness of morals which since his Oxford days it had always pleased him to affect; but to the consternation of his friends, who had ceased to credit the existence of any real moral obliquity, in 1865 came fatal revelations as the result of his bringing a libel action against the marquis of Queensberry; and at the Old Bailey, in May, Wilde was sentenced to two years’ imprisonment with hard labour for offences under the Criminal Law Amendment Act. It was a melancholy end to what might have been a singularly brilliant career. Even after leaving prison he was necessarily an outcast from decent circles, and he lived mainly on the Continent, under the name of “Sebastian Melmoth.” He died in Paris on the 30th of November, 1900. In 1885 he published his powerful Ballad of Reading Gaol. His Collected Poems, containing some beautiful verse, had been issued in 1862. While in prison he wrote an apology for his life which was placed in the hands of his executor and published in 1905.

The manuscripts of A Florentine Tragedy and an essay on Shakespeare’s sonnets were stolen from his house in 1865. In 1904 a five-act tragedy, The Duchess of Padua, written by Wilde about 1883 for Mary Anderson, but not acted by her, was published in a German translation (Die Herzogin von Padua, transl. Max Meyendorf, Berlin). It is impossible to take a purely objective view of Oscar Wilde’s work. The Old Bailey revelations removed all doubt as to the essential unhealthiness of his personal influence; but his literary genius was none the less remarkable, and his plays were perhaps the most original contributions to English dramatic writing during the period.

(H. C.)

WILDEBRUCH, ERNST VON (1845-1900), German poet and dramatist, was born on the 3rd of February 1845 at Beyrout in Syria, the son of the Prussian consul-general. Having passed his early years at Athens and Constantinople, where his father was attached to the Prussian legation, he came in 1857 to Germany, received his early schooling at the Gymnasium at Halle and the Französisches Gymnasium in Berlin, and, after passing through the Cadet school, became, in 1863, an officer in the Prussian army. He abandoned the military career two years later, but was recalled to the colours in 1866 for the war with Austria. He next studied law at the university of Berlin, and again served in the army during the Franco-Prussian War, 1870-71. In 1876 Wildenbruch was attached to the foreign office, which he finally quitted in 1900 with the title of counsellor of legation. He achieved his first literary successes with the epics Viervall (1874) and Sedan (1875). After publishing a volume of poems, Lieder und Balladen (Berlin, 1877; 7th ed., 1900), he produced, in 1882, the tragedy, Die Karolinger. Among his chief dramas may be mentioned the tragedy Harold (1883); Die Quitzow (1888); Der Generalfeldoberst (1889); Die Haubenlere (1891); Heinrich und Heinrichs Geschlecht (1893); Die Tochter des Erasmus (1900); and König Laurin (1902). Wildenbruch was twice (in 1884 and 1890) awarded the Schiller prize, and in 1892, created a doctor of philosophy honoris causa by the university of Jena. He also wrote several volumes of short stories (Novellen, 1883; Neuausgabe, 1885; Töte Wasser, 1887, &c.). He died on the 15th of January 1909.

WILDERNESS, a large forest in Spotsylvania county, Virginia, U.S.A., on the S. bank of the Rapidan, extending from Mine Run on the E. to Chancellorsville on the W. It is famous in military history for the battles of Chancellorsville (1863) and Wilderness (1864) during the American Civil War.

Chancellorsville.—In May 1863 a three days’ battle was fought at Chancellorsville between the Army of the Potomac, under General J. Hooker, and General Lee’s Army of Northern Virginia, which had stemmed the tide of invasion in the East by taking up a defensive position along the right or south bank of the Rappahannock. General Burnside had suffered a severe repulse in front of the Confederate position at Fredericksburg in December 1862, and his successor resolved to adopt the alternative plan of turning Lee’s flank and so gaining the road to Richmond. General Lee had meanwhile weakened his forces by detaching Longstreet’s two divisions and sending them to the lines of Hampton, Robertson and Jones. Hooker had now at his disposal 12,000 cavalry, 400 guns and 120,000 infantry and artillery, organized in seven corps (I. Reynolds, II. Couch, III. Sickles, V. Meade, VI. Sedgwick, XI. Howard, XII. Slocum). General Lee counted only 45,000 men of all arms effective. Hooker detached 10,000 cavalry under Stoneman and Sedgwick’s corps (30,000) to demonstrate on his flanks the Rapidan and at Fredericksburg, while with the remainder he moved up the Rappahannock and crossed that river and after surprising the Federals who fled panic at nightfall, but Jackson was mortally wounded. Next day the attack was resumed under the direction of Stuart, who was reinforced by Anderson, while McLawes now threatened the left flank of the Federals and Fitz Lee’s cavalry brigade operated against their line of retreat. Hooker finally gained the shelter of an inner line of works covering the ford by which he must retreat. Meanwhile, Early had checked Sedgwick, but when at last the Federal corps was about to overwhelm the Confederate division Lee came to succour it. Then Sedgwick was assailed by Early, McLawes and Anderson, and driven over the Rappahannock to join the remainder of Hooker’s beaten army, which had receded from the Rapidan on the 4th of May and marched back to Falmouth. Phister’s Record states that the Federal loss was 16,000 and that of the Confederates 12,000 men.

(G. W. R.)

Grant’s Campaign of the Wilderness and Cold Harbor.—On the evening of the 3rd of May 1864, after dark, the Army of the Potomac, commanded by Major General G. IO. Meade and consisting of the II. V. and VI. and Cavalry corps, left its winter quarters about Culpeper to manoeuvre across the Rapidan with a view to fighting a battle at or near New Hope Church and Craig’s Church. The army, and the IX. corps (Burnside), which was an independent command, were directed by Lieutenant-General Grant, the newly appointed commander of the armies of the United States, who accompanied Meade’s headquarters. The opposing Army of Northern Virginia under General R. E. Lee lay in quarters around Orange Court House (A. F. Hill’s corps), Verdiersville (Ewell’s corps) and Gordonsville
(Longstreet's corps). The respective numbers were: Army of the Potomac, 98,000; IX. corps, 22,000; Army of Northern Virginia rather less than 70,000.

The crossing of the Rapidan was made at Germanna and Ely's Fords, out of reach of Lee's interference, and in a few hours the two leading corps had reached their halting-places—V., Wilderness Tavern; and II., Chancellorsville. The VI. followed the V. and halted south of Germanna Ford. Two of the three divisions of cavalry preceded the march, and scouted to the front and flanks. Controversy has arisen as to whether the early halt of the Union army in the midst of the Wilderness was a serious error of judgment. The reason assigned was the necessity of protecting an enormous wagon train, carrying 15 days' supplies for the whole army, that was crossing after the II. corps at Ely's Ford. Burnside's corps was far to the rear when the advance began, but by making forced marches it was able to reach Germanna Ford during the 5th of May. On that day the manoeuvre towards Craig's Church was resumed at 5 A.M., Wilson's cavalry division moving from Parker's Store southward, the V. corps (Warren) moving from Wilderness Tavern towards Parker's Store, followed by the VI. under sedgwick, the II. from Chancellorsville by way of Todd's Tavern towards Shady Grove Church. Of the other cavalry divisions, Gregg's went to Frederickburg (near where the Confederate cavalry corps had been reported) and Torbert's (which had acted as rearguard and watched the upper Rapidan during the first day's march) was not yet across the river.

Grant's intention of avoiding a battle until he was clear of the Wilderness was not achieved, for Confederate infantry appeared on the Orange Turnpike east of Mine Run, where on his own initiative Warren had posted a division of the V. corps overnight as flank-guard, and some cavalry, judiciously left behind by Wilson at Parker's Store, became engaged a little later with hostile forces on the Orange Plank Road. This led to the suspension of the whole manœuvre towards Lee's right rear. The first idea of the Union headquarters was that Lee was falling back to the North Anna, covered by a bold rearguard, which Grant and Meade arranged to cut off and destroy by a convergent attack of Warren and Sedgwick. But the appearance of infantry on the Plank Road as well as the Pike had shown that Lee intended to fight in the Wilderness, and Hancock (II. corps) was called in from Todd's Tavern, while one division (Gettys') of the VI. was hurried to the intersection of the Brock and Plank roads to hold that point until Hancock's arrival. Gettys arrived just in time, for Confederate skirmishers were found dead and wounded only 30 yds. from the cross roads. The division then formed up to await Hancock's arrival up the Brock Road, practically un molested, for Lee had only two of his corps on the ground (Hill on the Plank Road, Ewell on the Pike), and did not desire to force a decision until Longstreet's distant corps should arrive.

Meanwhile Warren had been slowly forming up his attacking line with great difficulty in the woods. Grant appears to have used bitter words to Meade on the subject of Warren's delays,
and Meade passed these on to Warren, who in turn forced his subordinates into premature action. In the end, about noon, Griffin's division of Warren's corps attacked directly along the Pike and crushed the enemy's first line, but, unsupported by the VI corps on the right and Wadsworth's division (V. corps) on the left, both of which units were still groping their way forward in the woods, was forced back with heavy losses. Wadsworth took a wrong direction in the woods and presented himself as an easy victim to Ewell's right, soon after Griffin's repulse.

The VI. corps advanced later in the day on Warren's right, but was only partially engaged. The result of the attack on Ewell was not decided until the late hours of the night, Lee was determined, as always, to have the last word, and about 4.15–4.30 a fierce assault was delivered amidst the burning woods upon Hancock's entrenchments along the Brock Road. For a moment, aided by the dense smoke, the Confederates seized and held the first line of works, but a counter-stroke dislodged them. Burnside, though not expecting to have to attack before 6 p.m., put into the fight such of his troops as were ready, and at 5.30 or thereabouts the assaulting line reeled into the woods. Grant cancelled his order to attack at 6, and at the decisive point the battle was at an end. But on the extreme right of the Union army a sudden attack was delivered at sunset on Heth's and Ewell's brigades. This carried off two generals and several hundred prisoners, and a panic ensued which affected all the Union forces on the Pike, and was not quelled until after nightfall.

Lee, therefore, had the last word on both flanks, but in spite of this and of the very heavy losses, Grant had already resolved to go on, instead of going back like his various predecessors. To him, indeed, the battle of the Wilderness was a victory; an indecisive victory indeed, but one that had given him a moral superiority which he did not intend to forfeit. His scheme, drafted early on the morning of the 7th, was for the same march to Spottsylvania on the night of the 7th-8th, to assemble there on the 8th, and thence to undertake a fresh manœuvre against Lee's right rear on the 9th. This movement required the trains with the fighting line to be cleared away from the roads needed for the troops at once, and Lee promptly discovered that a movement was in progress. He mistook its object, however, and assuming that Grant was falling back on Fredericksburg, he prepared to shift his own forces to the south of that place so as to bar the Richmond road. This led to a race for Spottsylvania, which was decided more by accidents to either side than by the measures of the two commanding generals. On the Union side Warren was to move to the line Spottsylvania Court House-Todd's Tavern, followed by Hancock; Sedgwick was to take a roundabout route and to come in between the V. and II. corps; Burnside to follow Sedgwick. The cavalry was ordered to watch the approaches towards the right of the army. The movement began promptly after nightfall on the 7th. But ere long the head of Warren's column, passing in rear of Hancock's line of battle, was blocked by the headquarters escort of Grant and Meade. Next, the head of the V. corps was again checked at Todd's Tavern by two cavalry divisions which had been sent by Sheridan to regain the ground at Todd's Tavern, given up on the 6th, and after fighting the action of Todd's Tavern had received no further orders from him. Meade, greatly irritated, ordered Gregg's division out towards Corbin's Bridge and Merritt's (Torbert's) to Spottsylvania. On the latter road the Union cavalry found themselves opposed by Fitz Lee's cavalry, and after some hours of disheartening work in the woods, Merritt asked Warren to send forward infantry to drive the enemy. This Warren did, although he was just preparing to rest and to feed his men after their exhausting night-march. Robinson's division at the head of the corps deployed and swiftly drove in Fitz Lee. A little beyond Alsop's, however, Robinson found his path barred by entrenched infantry. This was part

1 Wilson's division, in its movement on Shady Grove Church on the 9th, had been cut off by the enemy's advance on the Plank Road and attacked by some Confederate cavalry. But it extricated itself and joined Gregg, who had been sent to assist him, at Todd's Tavern.

2 The Union losses in the battle were 18,000, the Confederates at least 11,000.

3 In consequence of a mistaken order that the trains which he was protecting were to move forward to Piney Branch Church.
of Anderson's (Longstreet's) corps. That officer had been ordered to draw out of his (Wilderness) works, and to bivouac, preparatory to marching at 3 A.M. to the Court House, but, finding no good resting-place, he had moved on at once. His route took him to the Catharpin Road (Hampton's cavalry protecting him toward Todd's Tavern) and captured the outworks Bridge to Block House Bridge. At or near Block House Bridge the corps halted to rest, but Stuart (who was with Fitz Lee) called upon Anderson for assistance and the march was resumed at full speed. Sheridan's new orders to Gregg and Merritt did not arrive until Meade had given these officers other instructions, but Wilson's cavalry division, which was out of the line of march of the infantry, acted in accordance with Sheridan's plan of occupying the bridges in front of the army's intended position at Spotsylvania Court House, and seized that place, inflicting a smart blow upon a brigade of Stuart's force that was met there.

The situation about 9 A.M. on the 8th was therefore curious. Warren, facing E., and opposed by part of Anderson's corps, was seeking to fight his way to Spotsylvania Court House by the Brock Road. Wilson, facing S., was holding the Court House and driving Fitz Lee's cavalry partly westward on to the backs of the infantry opposing Warren, partly towards Block House Bridge, whence the rest of Anderson's infantry was approaching. All the troops were weary and hungry, and Sheridan ordered Wilson to evacuate the Court House and to fall back to the line of the N.Y. This was ordered to Anderson's Confederate infantry at Spangler's, General Robinson being severely wounded, and his division disorganized. The other divisions came up by degrees, and another attack was made about 11. It was pressed close up to, and in some places over, the Confederate log-works, but it ended in failure like the first. A third attempt in the evening dwindled down to a reconnaissance in force. Anderson was no longer isolated. Early's division observed Hancock's corps at Todd's Tavern, but the rest of Ewell's and all Hill's corps went to Spotsylvania and prolonged Anderson's line northward towards the N.Y. Thus the re-grouping of the Union army for manoeuvre, and even the running fight or strategic pursuit imagined by Grant when he found Anderson at Spotsylvania, were given up, and on the 9th both armies rested. On this day General Sedgwick was killed by a long-range shot from a Confederate rifle. His place was taken by General H. G. Wright. On this day also a violent quarrel between Meade and Sheridan led to the departure of the cavalry corps on an independent mission. This was the so-called Richmond raid, in which Sheridan defeated Stuart at Yellow Tavern (where Stuart was killed) and captured the staffs of General Jackson and of Richmond, but, having started with empty forage wagons, had then to make his way down the Chickahominy to the nearest supply depots of the Army of the James, leaving the Confederate cavalry free to rally and to rejoin Lee.

Finding the enemy thus gathered in his front, Grant decided to fight again on the 9th. While Hancock opposed Early, and Warren and Wright Hill and Anderson, Burnside was ordered by Grant to work his way to the Fredericksburg-Spotsylvania road, thence to attack the enemy's right rear. The first stage of the advance of the IX. corps was made during the night of the 8th, but not the attack itself, and Burnside was consequently ordered not to go beyond a place called "Gate" on the maps used by the Union staff. This, it turned out, was not the farm of a person called Gate, as headquarters supposed, but a mere gate into a field. Consequendy it was missed, and the IX. corps went on to Gale's or Gayle's house, where the enemy's skirmishers were driven in. The news of an enemy opposing Burnside at "Gate," which Grant still supposed to be the position of the IX. corps, at once radically altered the plan of battle. Lee was presumed to be moving north towards Fredericksburg, and Grant saw an opportunity of a great and decisive success. The IX. corps was ordered to hold its position at all costs, and the others were to follow up the enemy as he concentrated upon Burnside. Hancock was called in from Todd's Tavern, sent down to force the fords of the Po to guard silently at a position between Wright and Block House Bridge by an officer of Grant's own staff, while Warren and Wright were held ready. But once more a handful of cavalry in the woods delayed the effective deployment of the moving wing, and by the time that the II. corps was collected opposite Block House Bridge it was already night. Still there was, apparently, no diminution of force opposite Burnside, and Hancock was ordered to resume his advance at early dawn on the 10th.

Meade, however, had little or no cognizance of Grant's orders to the independent IX. corps, and his orders, conflicting with those emanating from the Lieutenant-General's staff, puzzled Hancock and crippled his advance. At to the whole scheme was given up, and the now widely deployed Union army closed on its centre as best it could for a direct attack on the Spotsylvania position. At 4, before the new concentration was complete, and while Hancock was still engaged in the difficult operation of drawing back over the Po in the face of the enemy, Warren attacked unsupported and was repulsed. In the woods on the left Wright was more successful, and at 6 P.M. a rush of twelve selected regiments under Colonel Emory Upton carried the right of Lee's log-works. But for want of support this attack was fruitless, though Upton's own staff, while Warren and Wright were held ready. But once more a handful of cavalry in the woods delayed the effective deployment of the moving wing, and by the time that the II. corps was collected opposite Block House Bridge it was already night. Still there was, apparently, no diminution of force opposite Burnside, and Hancock was ordered to resume his advance at early dawn on the 10th.

Still there was, apparently, no diminution of force opposite Burnside, and Hancock was ordered to resume his advance at early dawn on the 10th.

This was the fourth battle since the evening of the 4th of May. On the morning of the 11th Grant sent his famous message to Washington, "I purpose to fight it out on this line if it takes all summer." The 12th was to be the fifth and, Grant hoped, the decisive battle. A maze of useful and useless entrenchments had been constructed on both sides, especially on the Union side, from mere force of habit. Grant, seeing from the experience of the 10th that his corps commanders were marring these entrenchments so strongly that they had only feebie forces disposable for the attack, ordered all superfluous defences to be given up. Three corps were formed in a connected line (from right to left, V., VI., IX.) during the 11th, and that night the II. corps was moved from Fredericksburg to Chancellorsville, and Burnside and formed up in the open field at Brown's in an attacking mass of Napoleon density—three lines of divisions, in line and in battalion and brigade columns. Burnside was to attack from Gayle's (Beverly's on the map) toward McCool's. Warren and Wright were to have at least one division each clear of their entrenchments and ready to move.

Up to the 11th Lee's line had extended from the woods in front of Block House Bridge, through Perry's and Spangler's fields to McCool's house, and its right was refused and formed in high ground. On the 11th McCool's division was removed, and Burnside's advance had caused Early's corps to entrench Spotsylvania and the church to the south of it, facing E. Between these two sections were woods. The connexion made between them gave the loop around McCool's the appearance from which it derives its historic name of The Salient. Upon the northern face of this Salient Hancock's attack was delivered.

On the 11th the abandonment of Burnside's threatening advance on his rear and other indices had disquieted Lee as to his left or Block House flank, and he had drawn off practically all Ewell's artillery from the McCool works to aid in that quarter. The infantry that manned the Salient was what remained of Stonewall Jackson's "foot cavalry," veterans of Antietam, Fredericksburg and Chancellorsville. But at 4:35, in the mist, Hancock's mass swept over their works at the first rush and swarmed in the interior of the Salient, gathering thousands of
WILDERNESS

prisoners and seizing the field batteries that Lee had sent back just too late.

The thronging and excited Federals were completely disordered by success, and the counter-attack of one or two Confederate brigades in good order drove them back to the line of the captured works. Then, about 6, there began one of the most remarkable struggles in history. While Early, swiftly drawing back from Block House, checked Burnside's attack from the east, and Anderson, attacked again and again by parts of the V. corps, was fully occupied in preserving his own front, Lee, with Ewell's corps and the few thousand men whom the other

time came, Lee succeeded so well that after twenty hours' bitter fighting the new line was ready and the Confederates gave up the barren prize to Hancock. Lee had lost 4,000 prisoners as well as 4,500 killed and wounded, as against 7,000 in the Army of the Potomac and the IX. corps.

There were other battles in front of Spottsylvania, but that of the 12th was the climax. From the 13th to the 20th the Federals gradually worked round from west to east, delivering a few partial attacks in the vain hope of discovering a weak point. Lee's position, now semicircular, enabled him to concentrate on interior lines on each occasion. In the end the

Federals were entrenched facing E. between Beverly's house (Burnside's old "Gayle") and Quisenberry's, Lee facing W. from the new works south of Harrison's through the Court House to Snell's Bridge on the Po. In the fork of the Po and the Ny, with woods and marshes to obstruct every movement, Grant knew that nothing could be done, and he prepared to execute a new manoeuvre. But here, as in the Wilderness, Lee managed to have the last word. While the Union army was resting in camp for the first time since leaving Culpeper, Ewell's corps suddenly attacked its baggage-train near Harris's house. The Confederates were driven off, but Grant had to defer his intended manoeuvre for two days. When the armies left Spottsylvania, little more than a fortnight after breaking up from winter quarters, the casualties had reached the totals of 35,000 out of

The tension was so great that, after threatening to deprive Warren of his command, Meade sent General Humphreys, his chief of staff, to direct the V. corps' attack.
an original total of 120,000 for the Union army, 26,000 out of 70,000 for the Confederates.

The next manoeuvre attempted by Grant to bring Lee's army to action "outside works" was of an unusual character, though it had been foreshadowed in the improvised plan of crushing Lee against Burnside's corps on the 9th. Hancock was now (20th) ordered to move off under cover of night to Milford; thence he was to march south-west as far as possible along the Richmond and Fredericksburg railroad, and to attack whatever force of the enemy he met. It was hoped that this bold stroke by an isolated corps would draw Lee's army upon it, and the rest of the Army of the Potomac would, if this hope were realized, drive down upon Lee's rear while Hancock held him up in front. Supposing, however, that Lee did not take the bait, the manoeuvre would resolve itself into a turning movement with the object of compelling Lee to come out of his Spottsylvania lines on pain of being surrounded.

The II. corps started on the night of the 20th-21st. The alarm was soon given. At Milford, where he forced the passage of the Mattaponi, Hancock found himself in the presence of hostile infantry from Richmond and heard that more had arrived at Hanover Junction, both from Richmond and from the Shenandoah Valley. He therefore suspended his advance and entrenched. The main army began to move off, after giving Lee time to turn against Hancock, at 10 a.m. on the 21st, and marched to Catlett's, a place a few miles S.W. of Guiney's bridge, Warren leading. Burnside and Wright following. But no news came in from Hancock until late in the evening, and the development of the manoeuvre was consequently delayed, so that on the night of the 21st-22nd Lee's army slipped across Warren's front en route for Hanover Junction. The other Confederate forces that had opposed Hancock likewise fell back. Grant's manoeuvre had failed. Its principal aim was to induce Lee to attack the II. corps at Milford, its secondary and alternative purpose was, by dislodging Lee from Spottsylvania, to force on an encounter battle in open ground. But he was only offered the bait—not compelled to take it, as he would have been if Hancock with two corps had been placed directly athwart the road leading to Spottsylvania and Hanover Junction—and, having unimpaired freedom of action, he chose to retreat to the Junction. The four Union corps, therefore, could only pursue him to the North Anna, at which river they arrived on the morning of the 23rd, Warren on the right, Hancock on the left, Wright and Burnside being well to the rear in second line. The same afternoon Warren seized Jericho Ford, brought over the V. corps to the south, side, and repulsed a very sharp counter-stroke made by one of Lee's corps. Hancock at the same time stormed a Confederate redoubt which covered the Telegraph Road bridge over the river. Wright and Burnside closed up. It seemed as if a battle was at hand, but in the night reports came in that Lee had fallen back to the South Anna, and as these were more or less confirmed by the fact that Warren met with no further opposition, and by the enemy's retreat from the river, back on the branch of the North Anna's front, the Union generals gave orders, about midday on the 24th, for what was practically a general pursuit. This led incidentally to an attempt to drive Lee's rearguard away from the point of passage, between Warren's and Hancock's, required for Burnside, and in the course of this it became apparent that Lee's army had not fallen back, but was posted in a semicircle to which the North Anna formed a tangent. On the morning of the 27th this position was reconnoitred, and found to be more formidable than that of Spottsylvania. Furthermore, it divided the two halves of the Union army that had crossed above and below.

Grant gave up the game as drawn and planned a new move. This had as its objects, first, the seizure of a point of passage...
on the Pamunkey; secondly, the deployment of the Army of the Potomac and of a contingent expected from the Army of the James, and thirdly, the prevention of Lee's further retirement, which was not desired by the Union commanders, owing to the proximity of the Richmond defences and the consequent want of room to manoeuvre. On the 27th Sheridan's cavalry and a light division of infantry passed the Pamunkey at Hanover Town, and the two divided wings of the Army of the Potomac were withdrawn over the North Anna without mishap—thanks to exactitude in arrangement and punctuality in execution. On the 28th the Army of the Potomac had arrived near Hanover Town, while at Hawes's Shop, on the road to Richmond, Sheridan and anvil battle was again taken up, the "anvil" being Smith's XVIII. corps, which had come up from the James river to White House on the 30th; but once more the lure failed because it was not made sufficiently tempting.

The last episode of the campaign centred on Cold Harbor, a village close to the Chickahominy, which Sheridan's cavalry seized, on its own initiative, on the 31st. Here, contrary to the expectation of the Union staff, a considerable force of Confederate infantry—now arrivals from the James—was met, and in the hope of bringing on a battle before either side had time to entrench, Grant and Meade ordered Sheridan to hold the village at all costs, and directed Wright's (VI.) corps from the extreme right wing, and Smith's (XVIII.) from Old Church, to march thither with all possible speed, Wright in the night of the 31st of May and Smith on the morning of the 1st of June. Lee had actually ordered his corps commanders to attack, but was too ill to enforce his wishes, and in the evening Wright and Smith themselves assaulted the Confederate front opposite Cold Harbor. The assault, though delivered by tired men, was successful. The enemy's first or skirmish line was everywhere stormed, and parts of the VI. corps even penetrated the main line. Nearly 800 prisoners were taken, and Grant at once prepared to renew the attack, as at Spottsylvania, with larger forces, bringing Hancock over from the right of the line on the night of the 1st, and ordering Hancock, Wright and Smith to
assault on the next morning. But Lee had by now moved more forces down, and his line extended from the Totopotomoy to the Chickahominy. Hancock's corps, very greatly fatigued by its night march, did not form up until after midday, and meanwhile Smith, whose corps, originally but 10,000 strong, had been severely tried by its hard marching and fighting on the 1st, refused to consider the idea of renewing the attack. The passive resistance thus encountered dominated Grant's fighting instinct for a moment. But after reconsidering the problem he again ordered the attack to be made by Wright, Smith and Hancock at 5 p.m. A last modification was made when, during the afternoon, Lee's far distant left wing attacked Burnside and Warren. This, showing that Lee had still a considerable force to the northward, and being, not very inaccurately, read to mean that the 6 m. of Confederate entrenchments were equally — i.e. equally thinly — guarded at all points, led to the order being given to all five Union corps to attack at 4:30 a.m. on the 3rd of June.

The resolution to make this plain, unvarnished frontal assault on entrenchments has been as severely criticized as any action of any commander in the Civil War, and Grant himself subsequently repudiated all of it. But such criticisms derive all their force from the event, not from the conditions in which, beforehand, the resolution was made. The risks of failure were deliberately accepted, and the battle — if it can be called a battle — was fought as ordered. The assault was made at the time arranged and was repulsed at all points, with a loss to the assailants of about 8000 men. Therefore the two armiers lay for ten days less than a hundred yards apart. There was more or less severe fighting at times, and an almost ceaseless bickering of skirmishers. Owing to Grant's refusal to sue for permission to remove his dead and wounded in the术语, it was clear that the Federal lambs of war parties and many wounded were left to die between the lines. It was only on the 7th that Grant pocketed his feelings and the dead were buried.

This is one of the many incidents of Cold Harbor that must always rouse painful memories — though to blame Lee or Grant supposes that these great generals were infinitely more inhuman here than at any other occasion in their lives, and takes no account of the consequences of admitting a defeat at this critical moment, when the causes for which the Union army and people contended were about to be put to the hazard of a presidential election.

The Federal army lost, in this month of almost incessant campaigning, about 50,000 men, the Confederates about 32,000. Though the aggregate of the Union losses awed both contemporaries and historians of a later generation, proportionately the losses of the South were heavier (46% of the original strength as compared with 41% on the Union side), and whereas within a few weeks Grant was able to replace nearly every man he had lost by a new recruit, the Confederate government was almost at the end of its resources.

**WILFRID, SIR JOHN** (c. 1621-1693), English agitator, was educated at the university of Cambridge, and during the Civil War served for a short time under Sir Thomas Fairfax. He became a monk, however, not as a soldier but as an agitator, being in 1643 one of the leaders of that section of the army which objected to all compromise with the king. In a pamphlet, Putney Projects, he attacked Cromwell; he was responsible for the Case of the Army stated, and he put the views of his associates before the council of the army at a meeting in Putney church in October 1647. The authorities looked upon him with suspicion, and in January 1648 he and John Lilburne were imprisoned, preparations, says Clarendon, being made "for his trial and towards his execution." However, he was released in the following August, and for a time he was associated with the party known as the levellers, but he quickly severed his connexion with them and became an officer in the army. He was a large buyer of the land forfeited by the royalists, and in 1654 he was sent to the House of Commons as member for Scarborough. In the following year he was arrested for conspiring against Cromwell, and after his release four months later he resumed the career of plotting, intriguing alike with royalists and republicans for the overthrow of the existing régime. In 1659 he helped to seize Windsor castle for the Long Parliament, and then in November 1661 he was again a prisoner on some suspicion of participating in republican plots. For six years he remained a captive, only regaining his freedom after the fall of Clarendon in October 1667.

In or before 1661 Wildman became prominent among those who were discontented with the rule of Charles II., being especially intimate with Algeron Sydney. He was undoubtedly concerned in the Rye House Plot, and under James II. he was active in the interests of the duke of Monmouth, but owing to some disagreement, or perhaps to his cowardice, he took no part in the rising of 1685. He found it advisable, however, to escape to Holland, and returned to England with the restoration of the Monarchy in 1688. In 1689 he was a member of the convention parliament.

Wildman was postmaster-general from April 1689 to February 1691, when some ugly rumours about his conduct brought about his dismissal. Nevertheless, he was knighted by William III. in 1692, and he died on the 2nd of June 1693. Sir John, who was the author of many political pamphlets, left an only son, John, who died childless in 1712.

**WILES, IRVING RAMSAY** (1861- ), American artist, was born at Utica, New York, on the 8th of April 1861. He studied under his father, the landscape painter, Lemuel Maynard Wiles (1826-1905), in the Art Students' League, New York, and under Carolus Duran, at Paris. His earlier work was as an illustrator for American magazines, and later he devoted himself with great success to portraiture. He became a full member of the National Academy of Design (1897) and a member of the American Water Color Society.
Theodore now divided Wilfrid's large diocese into three; and the aggrieved prelate went to lay his case before the bishop of Rome. On his way a west wind drove him to Friesland, where he evangelized the natives and prepared the way for Willibrord (p.120). Late in the spring he organized St. Lioba's bishopry of the Frisians. At Eymoutiers, near Angoulême (686) ordained his restitution; but even this decision could not prevent his being cast into prison on his return home. When released he wandered first to Mercia, then to Wessex and finally to Sussex. Here he rescued the pagan folk from an impending famine, sent preachers to the Isle of Wight and founded a monastery at Selby. After Ecgrith's death (20th May 685) Wilfrid was restored to York (much circumscribed), and Ripon (686-687). He was once more driven out in 691-692, and spent seven years in Mercia. A great council of the English Church held in Northumbria excommunicated him in 702. He again appealed to Rome in person, and obtained another decision in his favour (703-704). Despite the intercession of Brixwald, archbishop of Canterbury, Aldfrith king of Northumbria refused to admit the aged prelate into his kingdom till his last illness (705). This year or the next a council was held near the River Nidd, the papal letters were read, and, despite the opposition of the bishops, Wilfrid once more received the abbey of Ripon and Hexham. Not long after he died at Oundle in Northamptonshire as he was going on a visit to Ceolred, king of Mercia (709). He was buried at Ripon, whence, according to Ecgrith, his body was carried to the monastery of Erlangford.

Wilfrid's is a memorable name in English history, not only because of the large part he played in supplanting the Celtic discipline and in establishing a precedent of appeal to papal authority, but also by reason of his services to architecture and learning. At York he renewed Paulinus's old church, roofing it with lead and furnishing it with glass windows; at Ripon he built an entirely new basilica with columns and pinnacles; at Hexham in honour of St Andrew he reared a still nobler church, one of the great buildings of the subsequent days of his bishopric he used to travel about his diocese attended by a little troop of skilled masons. He seems to have also reformed the method of conducting the divine services by the aid of his skilled chanters, Ede and Zona, and to have established or renewed the rule of St Benedict in the monasteries. On each visit to Rome it was his delight to collect relics for his native land; and to his favourite basilica at Ripon he gave a bookcase wrought in gold and precious stones, besides a splendid copy of the Gospels.

Wilfrid's life was written shortly after his death by Eddius at the request of Acca, his successor at Hexham, and Tathbert, abbot of Ripon, both of whom were of great bishop. Other lives were written by Frithgode in the 10th, by Fokard in the 11th, and by Edmer early in the 12th century. See also Bede's Hist. Eccl. v. 19, iii. 25, iv. 13, &c. All the lives are printed in J. Kaine's Historians of the Church of York (2 vols. 1829-31), and they are prefixed to the Wulfstan Rolls *secreta*.

**Wilhelmina (WILHELMINA) HELENA PAULINE MARIA OF ORANGE-NASSAU** (1880-), queen of the Netherlands, was born at the Hague on the 31st of August 1880. Her father, William III. (Willem Paul Alexander Frederik Lodewijk), had by his first wife, Sophia Frederika Mathilde of Württemberg, three sons, all of whom predeceased him. Having been left a widow on the 3rd of June 1877, he married on the 7th of January 1879 Adelheid Emma Wilhelmina Theresia, second daughter of Prince George Victor of Waldeck-Pyrmont, born on the 2nd of August 1859, and Wilhelmina was the only issue of that union. She succeeded to the throne on her father's death, which took place on the 23rd of November 1890, but until her eighteenth year, when she was "inaugurated" at Amsterdam on the 6th of September 1898, the business of the state was carried on under the regency of the queen-mother, in accordance with a law made on the 2nd of August 1884. On the 7th of February 1901 Queen Wilhelmina married Henry Wladimir Albert Ernst, duke of Mecklenburg-Schwerin (born on the 19th of April 1876). To the great joy of the Dutch people, Queen Wilhelmina gave birth on the 10th of April 1909, in the Palace of Huis ten Bosch, to a son, born to the throne, the Prince of Orange Nassau (Juliana Louise Emma Maria Wilhelmina). (See Holland: History.)

**Wilhelmina (Sophia Frederika Wilhelmina) (1700-1738), margravine of Baireuth, was born in Berlin on the 3rd of July 1709, the daughter of Frederick William I., crown prince, afterwards king of Prussia, and of Sophia Dorothea, daughter of the elector of Hanover (George I. of England).**

Wilhelmina shared the unhappy childhood of her brother, Frederick the Great, whose friend and confidante she remained, with the exception of one short interval, all her life. Sophia Dorothea wished to marry her daughter to Frederick, prince of Wales, but on the English side there was no disposition to make the offer except in exchange for substantial concessions. The wish of the king of Prussia was not prepared to assent. The fruitless intrigues carried on by Sophia Dorothea to bring about this match played a large part in Wilhelmina's early life. After much talk of other matches, which came to nothing, she was eventually married in 1731 to Frederick, hereditary prince of Baireuth. The marriage, only accepted by Wilhelmina under threats from her father and with a view to lightening her brother's disgrace, proved at the outset a happy one, though it was clouded at first by narrow means, and afterwards by the infidelities of the future margrave with Dorothea von Marwitz, whose ascendency at the court of Baireuth was bitterly resented by Frederick the Great, and caused an estrangement of some three years between Wilhelmina and the brother she so devotedly loved. When Wilhelmina's husband came into its inheritance in 1735 the pair set about making Baireuth a miniature Versailles. Their building operations included the rebuilding of their summer residence, the Ermitage, the great Baireuth opera-house, the building of a theatre and the reconstruction of the Baireuth palace and of the new opera house. They also founded the university and the Charles Eugenius (Duke of Württemberg) and theart of the margravine, bringing the court to the verge of bankruptcy.

The margravine made Baireuth one of the intellectual centres of Germany, surrounding herself with a little court of wits and artists which gained added prestige from the occasional visits of Voltaire and Frederick the Great. With the outbreak of the Seven Years' War, Wilhelmina's interests shifted from dilettantism to diplomacy. She acted as eyes and ears for her brother in southern Germany until her death on the 14th of October 1758, the day of Frederick's defeat by the Austrians at Hochkirch. Her only daughter Fredericka had contracted in 1748 an unhappy marriage with Charles Eugenius (Duke of Württemberg) and theart of the margravine, being rescued from it by the marriage of Wilhelmina of the Prussian family in 1756.

The margravine's memoirs, Mémoires de ma vie, written or revised between 1748 and her death, are preserved in the Royal Library of Berlin. They were first printed in two forms in 1810—a German translation down to the year 1733 from the firm of Cotta of Tübingen; and in French, published by Veyrandon du Brusacier and prefixed with a memoir by the margravine, which was printed between 1748 and 1749. There have been several subsequent editions, including a German one published at Leipzig in 1898. An English translation was published in London in 1899. For the French translation see also Arvede, Les Mémoires de Wilhelmine, Margravine of Baireuth (London, 2 vols. 1905); and R. Fester, Die Bayreuther Schwester Friedrichs des Grossen (Berlin, 1902).

**Wilhelmshaven, or Wilhelmshaffn, a town of Germany,** and the chief naval station and war harbour of the empire on the North Sea, situated on the northwest shore of the Jade Busein, a large shallow basin formed by inundations and united with the sea by the Jade, a channel 3 m. long. Pop. (1885), 19,427; (1903), 26,012, of whom 827 belonged to the navy or army. For the town see J. A. Vroedt, Wilhelmshafft, Merkwaardige van Baireuth (London, 2 vols. 1905); and R. Fester, Die Bayreuther Schwester Friedrichs des Grossen (Berlin, 1902).

**Wilhelmshaven, or Wilhelmshaffn, a town of Germany,** and the chief naval station and war harbour of the empire on the North Sea, situated on the northwest shore of the Jade Busein, a large shallow basin formed by inundations and united with the sea by the Jade, a channel 3 m. long. Pop. (1885), 19,427; (1903), 26,012, of whom 827 belonged to the navy or army. For the town see J. A. Vroedt, Wilhelmshafft, Merkwaardige van Baireuth (London, 2 vols. 1905); and R. Fester, Die Bayreuther Schwester Friedrichs des Grossen (Berlin, 1902).
acres in area and 26½ ft. deep) is connected by means of a lock (57½ ft. long) with the new harbour entrance, which was completed in 1886. On the north it is connected with the fitting-out basin (383½ ft. long, 446 ft. wide), which again is connected by a lock (158 ft. long) with the outer basin (617½ ft. long, 410½ ft. wide), and so with the old harbour entrance. North of this the "third entrance" has been recently constructed, with two enormous locks, one of which in an emergency could be used as an additional dock. On the west side of the fitting-out basin lies the shipbuilding basin (1237½ ft. long by 744½ ft. wide), with three dry-docks (of which the 452½ ft. wide, 30½ ft. deep, whilst the third is 304½ ft. long), and also with two slips of the largest size. Further new docks (each about 617½ ft. by 97 ft.), capable of containing large battle-ships, were completed in 1906. A torpedo harbour lies to the south-east of the new harbour. The three entrances to the old and new harbours are sheltered by long and massive moleis; and the whole complex of docks, building slips, machine shops, &c., forms the government dockyard, which is enclosed by a lofty wall with fourteen iron gates. The establishment is defended by strong fortifications.

The commercial harbour lies on the south side of the town at the east end of the Ems-Jade canal. The industries of the place are almost exclusively connected with the requirements of the dockyard, and embrace machine shops, iron foundries and boiler works. Wilhelmshaven is visited for its sea-bathing. It possesses depots for artillery and mines, a meteorological observatory and a signalling station. A battalion of marines is stationed here.

Since 1900 the development of the naval establishment and of the town has been exceptionally rapid, coincident with the growth of the German navy, and with the shifting of political and naval activity from the Baltic to the North Sea.

See Eberhard, "Näher durch Wilhelmshaven und seine Umgebung" (Wilhelmshaven, 1906); L. v. Krohn, "Vierzig Jahre in einem deutschen Kriegshafen" (Wilhelmshaven, 1905).

WILKES, CHARLES (1798–1872), American naval officer and explorer, was born in New York City on the 3rd of April 1798. He entered the United States Navy as a midshipman in 1818, and became a lieutenant in 1826. In 1830 he was placed in charge of the division of instruments and charts, and in 1838 was appointed to command an exploring and surveying expedition in the Southern Seas, authorized by Congress in 1836. The expedition, including naturalists, botanists, a mineralogist, twelve marines, and a medical officer, sailed from New York on the 1st of November 1837, and returned to the United States on the 1st of July 1841, after having visited the Fiji, Samoan, and Haurorian islands, the western coast of South America, including the Columbia river, San Francisco Bay and the Sacramento river, in 1841, and returned by way of the Philippine islands, the Sulu archipelago, Borneo, Singapore, Polynesia and the Cape of Good Hope, reaching New York on the 10th of June 1842. He was court-martialled on his return, but was acquitted on all charges except that of illegally punishing men in his squadron. For a short time he was attached to the Coast Survey, but from 1844 to 1861 he was chiefly engaged in preparing the report of the expedition. Twenty-eight volumes were printed but only nineteen were published. Of these Wilkes wrote the "Narrative" (2 vols., 1857), and dealt with the "Voyages" and "Hydrography and Meteorology" (1851). The "Narrative" contains much interesting material concerning the manners and customs of the people and political and economic conditions in many places then little known. Other valuable contributions were the three reports of James D. Dana on Zoophytes (1846), Geology (1849) and Crustacea (2 vols., 1852–1854). At the outbreak of the Civil War, Wilkes (who had reached the rank of commander in 1843 and that of captain in 1853) was assigned to the command of the "San Jacinto" to search for the Confederate commerce destroyer, "Sumter." On the 8th of November 1861 he stopped the British mail packet "Trent," and took off the Confederate commissioners to Europe, James M. Mason and John Slidell. This action was strongly disapproved by Congress, and Wilkes' action was later disavowed by President Lincoln. In 1863 he was given command of the James river flotilla, but after reaching the rank of commodore, on the 16th of July 1862, he was assigned to duty against blockade runners in the West Indies. He was disrated (becoming a captain) on the retired list in November 1862 on the ground that he had been too old to receive the rank of commodore under the act then governing promotions; and engaged in a long controversy with Gideon Welles, secretary of the navy. This controversy ended in his being court-martialled in 1864 and being found guilty of mutiny and sentenced to public reprimand and three years' additional service. But on the 25th of October 1866 he was promoted to the rank of rear-admiral on the retired list.

He died at Washington on the 8th of February 1877.

In addition to many shorter articles, reports, &c., he published Western America, including California and Oregon (1849) and Theory of the Winds (1856).

WILKES, JOHN (1727–1757), English politician, descended from a family long connected with Leighton-Buzzard in Bedfordshire, was born at Clerkenwell, London, on the 17th of October 1727, being the second son of Israel Wilkes, a rich distiller, and the owner, through his wife Sarah, daughter of John Heston of Hoxton, of considerable house property in its north-eastern suburbs. After some training under private tuition John Wilkes was sent to the university of Leyden, matriculating there on the 8th of September 1744. Several young men of talent from Scotland and England were studying in this Dutch university at that period, and a lively picture of their life, in which Wilkes displays the gayety of temper which remained faithful to him all his days, is presented to us by Alexander Carlyle ("Autobiog.", ed. J. H. Burton). With this training he acquired an intimate knowledge of classic literature, and he enlarged his mind by travelling through Holland, Flanders and part of Germany. At the close of 1748 he returned to his native land, and in a few months (October 1749) was drawn by his relations into marrying Mary, sole daughter and heiress of John Mead, citizen and grocer of London, who was ten years his senior. The ill-assorted pair—for she was grave and staid, while he roved in exuberant spirits and love of society—lived together at Aylesbury for some months, when, to make matters worse, they returned to town to dwell with her wife's mother. One child, a daughter, was born to them (5th of August 1750), and then Wilkes left his wife and removed to Westminster, where he kept open house for many young men about town possessing more wit than morals. In 1754 he contested the constituency of Berwick-upon-Tweed, but failed to gain the seat.

Wilkes was now a well-known figure in the life of the west end, and among his associates were Thomas Potter, the son of the archbishop of Canterbury, Sir Francis Dashwood, afterwards Lord le Despencer, and Lord Sandwich, the last of whom in after years showed great animosity towards his old companion in revelry. In July 1757, by a triangular arrangement in which Potter and the first William Pitt played the other parts, Wilkes was elected for Aylesbury, and for this constituency he was again returned at the general election in March 1761. Pitt was his leader in politics; but to Pitt he applied in vain for a seat at the Board of Trade, nor was he successful in his application for the post of ambassador at Constantinople, or for that of governor of Quebec. As he attributed these failures to the opposition of Lord Bute, he established a paper called the North Briton (June 1762), in which he from the first attacked the Scotch prime minister with exceeding bitterness, and grew bolder as it
proceeded in its course. One of its articles ridiculed Lord Talbot, the steward of the royal household, and a duel was the result. When Bute resigned, the issue of the journal was suspended; but, when the royal speech forwarded by George Grenville's ministry showed that the change was one of men only, not of measures, a supplementary number, No. 45, was published, 23rd of April 1763, containing a caustic criticism of the king's message to his parliament. Lord Halifax, the leading secretary of state, issued a general warrant "to search for authors, printers and publishers," and to bring them before him for examination. Charles Churchill, the poet and a co-author in this newspaper enterprise, escaped through the good offices of Wilkes; but the chief offender was arrested and thrown into the Tower (30th of April 1763). A week later, however, he was released by order of the Court of Common Pleas on the ground that his privilege as a member of parliament afforded him immunity from arrest. General warrants were afterwards declared illegal, and Halifax himself, after a series of discardable shifts, was cast in heavy sums, on actions brought against him by the persons whom he had injured—the total expenses incurred by the ministry in these lawless proceedings amounting to at least £100,000. So far Wilkes had triumphed over his enemies, but he gave them cause for rejoicing by an indirect reprint of the obnoxious No. 45, and by striking off at his private press thirteen copies of an obscene Essay on Woman. Fenton, by his friend Potter, a re-publication of his Essay on Man, one of which got into the hands of Lord Sandwich. Immediately on the meeting of the House of Commons (15th of November 1763) proceedings were taken against him. Lord North moved that No. 45 was "a false, scandalous and seditious libel," and the paper was publicly burnt in Cheapside on the 4th of December. The Essay on Woman was on the same day brought before the Upper House by Lord Sandwich, and, on account of the improper use which had been made of Bishop Warburton's name as the author of some coarse notes, the work was voted a breach of privilege, and Wilkes was ordered to be prosecuted in the Court of King's Bench for printing and publishing an obnoxious libel. He was expelled from the House of Commons on the 19th of January 1764; and on the 21st of February he was found guilty in the King's Bench of reprinting No. 45 and of printing and publishing the Essay on Woman. Wilkes was on these dates absent from England. Some strong expressions applied to him by Samuel Martin, an ex-secretary of the treasury, had provoked a duel (16th of November 1763), in which Wilkes was severely wounded in the stomach. He withdrew to Paris, and as he did not return to England to receive his sentence in the law courts was permitted to stay there.

For several years Wilkes remained abroad, receiving £1000 a year from the leading Whigs, and in the course of his travels he visited many parts of Italy. In February 1768 he returned to London and sued the king for pardon, but in vain. His next step was to offer himself as a candidate for the representation of the city of London, when he was the lowest at the poll. Undaunted by this defeat, he solicited the freeholders of Middlesex to return him as their champion, and they placed him at the head of all competitors (28th of March). He appeared before the King's Bench, and on a technical point procured a reversal of his outlawry; but the original verdict was restored, and he was sentenced to imprisonment for twenty-two months as well as to a fine of £5000, and he was further ordered to produce securities for good behaviour for seven years after his liberation. His conduct was brought before the House of Commons, with the result that he was expelled from the House on the 3rd of February 1769, and with this proceeding there began a series of contests between the ministry and the electors of Middlesex without parallel in English history. They promptly re-elected him (10th of February), only to find him pronounced incapable of sitting, and his election void. Again they returned him (16th of March) and again he was rejected. A fourth election then followed (13th of April), when Colonel Henry Lawes Luttrell, with all the influence of the court and the Fox family in his favour, obtained 296 votes, while 1143 were given for Wilkes, but two days later the House declared that Luttrell had been duly elected. Through these audacious proceedings a storm of fury broke out throughout the country. In the cause of "Wilkes and liberty" high and low enlisted themselves. His prison cell was thronged daily by the chief of the Whigs, and large sums of money were subscribed for his support. So great was the popular sympathy in his favour, that a keen judge of contemporary politics declared that, had George III. possessed a bad and Wilkes a good character, the king would have been an outcast from his dominions. At the height of the conflict in January 1769 Wilkes was elected an alderman for the city of London; in 1771 he served as sheriff for London and Middlesex, and as alderman he took an active part in the struggle between the corporation and the House of Commons by which freedom of publication of the parliamentary debates was obtained. His admirers endeavoured in 1772 to procure his election as lord mayor of London, but he was set aside by the aldermen, some of whom were allied with the ministry of Lord North, while others, as Oliver and Townshend, leant to the Liberalism of Lord Shelburne. In 1774, however, he obtained that dignity, and he retained his seat for Middlesex from the dissolution in 1774 until 1790. He moved in 1776 for leave to bring in a bill "for a just and equal representation of the people of England in parliament"; but attempts at parliamentary reform were premature by at least half a century. After several failures he was once more the attention of another direction, for on the 3rd of May 1782 all the declarations against him for his elections in Middlesex were ordered to be expunged from the journals of the House. In 1779 Wilkes was elected chamberlain of the city by a large majority, and the office became his freehold for life. He died at his house in Grosvenor Square, London, on the 26th of December 1797. His daughter Mary, to whom he was tenderly attached, died on the 12th of March 1802.

Wilkes printed editions of Catullus (1788) and Theophrastus (1790), and at the time of his death had made considerable progress with a translation of Vergil. He was a master of a caustic ridicule, of obscenity and profanity; but he knew how to suit his conversation to his company, and his well-known assertion that, in spite of his squint and ugly as he was, with the start of a quarter of an hour he could get the better of any man, however good-looking, in the graces of any lady, shows his confidence in his powers of fascination. The king was obliged to own that he had never met so well-bred a lord since he was young. To Gibbon he was "the most unscrupulous of criminals, and his devoted friend and legal adviser, Serjeant Glynn, "Ah, sir! he was a Wilkite, which I never was." His writings were marked by the same electric sarcasm that had marked Willett, his correspondent, one of Letters to his Daughter, in four volumes in 1804, the other Correspondence with his Friends, in which are introduced Memoirs of his Life, by John Almon, in five volumes, in 1805. A Life by Percy Fitzgerald was published in 1888. Essays on him are in Historical Gleanings, by J. E. Thorold Rogers, 2nd ser. (1870): Wilkes and Cobbett, by J. S. Watson (1879); and Wilkes, Sheridan and Fox, by W. P. Ree (1874). His connexion with Bath is set out in John Wilkes and Cobbett, by W. Gregory (1888) and that with the city of London in Modern History of the City, by Charles Welch (1896). A fragment of his autobiography (Br. Museum Addit. MSS. 30865), chiefly descriptive of his residence in France and Italy, was printed in 1888. F. Taylor of Harrow in (W. P. C.)

WILKES-BARRÉ, a city and the county-seat of Luzerne county, Pennsylvania, U.S.A., on the north branch of the Susquehanna river, about 100 m. N.N.W. of Philadelphia. Pop. (1890), 37,718; (1900), 51,721, of whom 12,188 were foreign-born, including 2702 Germans, 2083 Welsh, 2034 Irish, 1578 English and 1000 Russian Poles; (1910 census), 67,105. Area, 48 sq. m. Wilkes-Barré is served by the Central Railroad of New Jersey, the Lehigh Valley, the Delaware, Lackawanna & Western, the Delaware & Hudson, the New York, Susquehanna & Western and the Pennsylvania railways, and by three interurban electric lines—the Wilkes-Barré & Hazleton, connected with Hazleton, about 20 m. S., the Wilkes-Barré & Wyoming Valley, and the Lackawanna & Wyoming Valley, connecting with Scranton about 17 m. N.E. On the opposite bank of the river (which is here spanned by two iron bridges) lies Kingston.
The city is attractively situated in the historic Wyoming Valley. The principal public buildings include the county court-house, the post office, the city hall, the county gaol and the 9th Regiment Armory. Among the city parks are Hollenback (102 acres) and Riverside (19 acres) parks, the River Common (35 acres) and the Frances Slocum Playground. In the city are the Harry Hillman Academy (non-sectarian), a secondary school for boys; the Malinckrodt Convent, the Wilkes-Barré Institute (Presbyterian), a school for girls; St Mary’s Academy (Roman Catholic) for girls; the Osterhout Free Library (44,000 vols.), the Library of the Law and Library Association (10,000 vols.) and that of the Wyoming Historical and Geological Society (18,000 vols.), which was founded in 1858. Wilkes-Barré is situated in the centre of the richest anthracite coal region in the United States, Luzerne county ranking first in 1908 in the production of anthracite in Pennsylvania; and the value of the factory products increased from $8,616,765 in 1900 to $11,246,893 in 1905, or 39.3%. Among important manufactures are foundry and machine-shop products, valued at $1,273,491 in 1905; silk and silk-competition ($1,054,863); lace curtains, cotton goods, wirework, &c.

The city is governed by a mayor elected for three years, and by a legislative body composed of a select council (one member from each of the 16 wards elected for four years) and of a common council (one member from each ward, elected for two years).

The township of Wilkes-Barré was one of five townships the free grant of which, in December 1768, by the Susquehanna Land Company of Connecticut was intended to encourage settlement and make good the company’s claim to the Wyoming Valley (300 sq. mi.). In May 1769 more than 100 settlers from New England, in command of Major John Durkee (1728-1782), arrived at this place. With others who came a few days later they erected the necessary log cabins on the river bank, near the present Ross Street, and in June began to enclose these within a stockade, known as Fort Durkee. During the same summer Major Durkee gave the town its present name in honour of John Wilkes (1727-1797) and Colonel Isaac Barré (1726-1802), both stout defenders in parliament of the American colonists’ cause before and during the War of Independence, and in the following year the town plat was made. In September 1769, the “First Pennamite-Yankee War,” and the conflict between Connecticut and Pennsylvania for the possession of the valley is called, broke out. The Yankees lost Fort Durkee in November, but recovered it in the following February. The Pennamites erected Fort Wyoming on the river bank near the present Northampton Street in January 1771, but the Yankees took it from them in the following August. In the War of Independence, immediately after the battle of Wyoming (July 3, 1778), Wilkes-Barré was burned by the Indians and British Rangers; and again in July 1784, during the “Second Pennamite-Yankee War,” twenty-three of the twenty-six buildings were burned. In 1786 the Pennsylvania legislature sent here Colonel Timothy Pickering (q.v.) to organize Luzerne county, and to effect a reconciliation between the Connecticut settlers and the government of Pennsylvania. Colonel John Franklin (1749-1831) led a counter movement, and was imprisoned on a charge of treason in October 1787, but Franklin’s followers retaliated by kidnapping Pickering in June 1788, and kept him in the woods for nearly three weeks in a vain effort to make him promise to intercede for Franklin’s pardon. Wilkes-Barré was gradually rebuilt after its destruction in 1784, and in 1806 the borough was erected, though it was not separated politically from the township until 1818 (or 1819). A new charter was granted to the borough in 1835, and Wilkes-Barré was chartered as a city in 1871.

WILKIE, SIR DAVID (1785-1841), Scottish painter, was born on the 18th of November 1785, the son of the parish minister of Colts in Fifeshire. He was early imbued with a love for art. In 1790, after he had attended school at Pitlessie, Kettle and Cupar, his father reluctantly yielded to his desire to become a painter; and through the influence of the earl of Leven Wilkie was admitted to the Trustees’ Academy in Edinburgh, and began the study of art under John Graham, the teacher of the school. From William Allan (afterwards Sir William Allan and president of the Royal Scottish Academy) and John Burnet, the engraver of Wilkie’s works, we have an interesting account of his early studies, of his indomitable perseverance and power of close application, of his habit of haunting fairs and market-places, and transferring to his sketch-book at such he caught in figure or incident, and of his admiration for the works of Carse and David Allan, two Scottish painters of scenes from humble life. Among his pictures of this period are mentioned a subject from Macbeth, “Ceres in Search of Proserpine,” and “Dianna and Calisto,” which in 1803 gained a premium of ten guineas at the Trustees’ Academy, while his pencil portraits of himself and his mother, dated that year, and now in the possession of the duke of Buccleuch, proved that he had already attained considerable certainty of touch and power of rendering character. A scene painted by the “Blind Fiddler,” and a sketch from MacNeill’s ballad of Scotland’s Skait, afterwards developed into the well-known “Village Politicians,” were the first subjects in which his true artistic individuality began to assert itself.

In 1804 Wilkie returned to Cults, established himself in the manse, and began his first important subject-picture, “Pitlessie Fair,” which includes about 140 figures, and in which he introduced portraits of his neighbours and of several members of his family circle. In addition to this elaborate figure-piece, Wilkie was much employed at the time upon portraits, both at home and in Kinghorn, St Andrews and Aberdeen. In the spring of 1805 he left Scotland for London, carrying with him his “Bounty-Money, or the Village Recruiter,” which he soon disposed of for £6, and began to study in the schools of the Royal Academy. One of his first patrons in London was Stodart, a pianoforte maker, a distant connexion of the Wilkie family, who commissioned his portrait and other works and introduced the young artist to the dowager-countess of Mansfield. This lady’s son was the purchaser of the “Village Politicians,” which attracted great attention when it was exhibited in the Royal Academy of 1806, where it was followed in the succeeding year by the “Blind Fiddler,” and a second portrait of the lady’s lifelong friend Sir George Beaumont. Wilkie now turned aside into the paths of historical art, and painted his “Alfred in the Neatherd’s Cottage,” for the gallery illustrative of English history which was being formed by Alexander Davison. After its completion he returned to genre-painting, producing the “Card-Players” and the admirable picture of the “Rent Day,” which was composed during recovery from a fever contracted in 1807 while on a visit to his native village. His next great success was the “English Deluge,” afterwards entitled the “Village Festival” (now in the National Gallery), which was purchased by J. J. Angerstein for 800 guineas. It was followed in 1813 by the well-known “Blind Man’s Buff,” a commission from the prince regent, to which a companion picture, the “Penny Wedding,” was added in 1818.

Meanwhile Wilkie’s eminent success in art had been rewarded by professional honours. In November 1800 he was elected an associate of the Royal Academy, when he had hardly attained the age prescribed by its laws, and in February 1811 he became a full academician. In 1812 he opened an exhibition of his collected works in Pall Mall, but the experiment was unsuccessful, entailing pecuniary loss upon the artist. In 1814 he executed the “Letter of Introduction,” one of the most delicately finished and perfect of his cabinet pictures. In the same year he made his first visit to the continent, and at Paris entered upon a profitable and delighted study of the works of art collected in the Louvre. Interesting particulars of the time are preserved in his own matter-of-fact diary, and in the more sprightly and flowing pages of the journal of Haydon, his fellow-traveller. On his return he began “Distraining for Rent,” which was the most popular of his pictures. In 1816 he made a tour through Holland and Belgium in company with Raimbach, the engraver of many of his paintings. The “Sir
WILKINS, SIR C.

Walter Scott and his Family," a cabinet-sized picture with small full-length figures in the dress of Scottish peasants, was the result of a visit to Abbotsford in 1818. "Reading a Will," a commission from the king of Bavaria, now in the New Pinakothek at Munich, was completed in 1820; and two years later the great picture of "Chelsea Pensioners Reading the Gazette of the Battle of Waterloo," commissioned by the duke of Wellington in 1816, at a cost of 1200 guineas, was exhibited at the Royal Academy.

In 1822 Wilkie visited Edinburgh, in order to select from the royal progress of George IV. a sitting subject for a picture. The Reception of the King at the Entrance of Holyrood Palace was chosen; and this was executed in 1824. But in the following year, when the artist, upon the death of Raeburn, had been appointed royal limmer for Scotland, he received sittings from the monarch, and began to work diligently upon the subject. But several years elapsed before its completion; for, like all such ceremonial works, it proved a harassing commission, uncongenial to the painter while in progress and unsatisfactory when finished. His health suffered from the strain to which he was subjected, and his condition was aggravated by heavy domestic trials and responsibilities. In 1825 he sought relief in foreign travel; after visiting Paris, he passed into Italy, where he remained for some time, and the handsome reward which, before he left, was promised him for an essay of a union of his earlier and later styles, a "mixture" which was very justly pronounced by Haydon to be "like oil and water." His "Preaching of John Knox before the Lords of the Congregation" had also been begun before he left for abroad; but it was painted throughout in the later style, and consequently presents a more satisfactory unity and harmony of treatment and handling. It was one of the most successful pictures of the artist's later period.

In the beginning of 1830 Wilkie was appointed to succeed Sir T. Lawrence as painter in ordinary to the king, and in 1836 Sir David Baird, who had been an honorary Professor of Fine Arts at the University of Edinburgh, was created a baronet. Two of his works, which occupied him until the end were "Columbus in the Convent at La Rabida" (1835); "Napoleon and Fuss VII. at Fontainebleau" (1836); "Sir David Baird Discovering the Body of Tippoo Sahib" (1838); the "Empress Josephine and the Fortune-Teller" (1838); and "Queen Victoria Presiding at her First Council" (1838). His time was also much occupied with portrait-painting, many of his works of this class being royal commissions. His portraits are pictorial and excellent in general distribution, but the faces are frequently wanting in character, in which the charm of his best portraits, his way of showing his sitters at their best, and his female portraits, in particular, rarely gave satisfaction. A favourable example of his cabinet-sized portraits is that of Sir Robert Liston; his likeness of W. Esdaile is an admirable three-quarter length; and one of his finest full-lengths is the gallery portrait of Lord Kellie, in the town hall of Cupar.

In the autumn of 1840 Wilkie resolved on a voyage to the East. Passing through Holland and Germany, he reached Constantinople, where, while detained by the war in Syria, he painted a portrait of the young sultan. He then sailed for India, and travelled to Jerusalem, where he remained a month, on a return voyage of five busy weeks. The last work of all upon which he was engaged was a portrait of Mehmet Ali, done at Alexandria. On his return voyage he suffered from an attack of illness at Malta, and died at sea off Gibraltar on the morning of the 1st of June 1841. His body was consigned to the deep in the Bay of Gibraltar.

An elaborate Life of Sir David Wilkie, by Allan Cunningham, containing, the painter's journals and his observant and well-considered "Critical Remarks on Works of Art," was published in 1843. Redgrave's Century of Painters of the English School and John Burnet's Practical Essays on the Fine Arts may also be referred to for a critical estimate of his works. A list of the exceptionally numerous and excellent engravings from his pictures will be found in the Art Union Journal for January 1840. Apart from his skill as a painter Wilkie was an admirable etcher. The best of his plates, such as the "Gentleman at his Desk" (Laing, VII.), the "Pope examining a Censer" (Laing, VIII.), and the "Seat of Hands" (Laing, IV.), are worthy to rank with the work of the greatest figure-etchers. During his lifetime he issued a portfolio of seven plates, and in 1854 Dr. Dana and Dr. J. W. Esdaile catalogued and published the complete series of his etchings and dry-points, supplying the place of a few copper-plates that had been lost by reproductions, in his Etchings of David Wilkie and Andrew Geddes.

WILKINS, SIR CHARLES (1749-1836), English Orientalist, was born at Frome, Somersetshire, probably in 1749, and in 1770 he went to India as a writer in the East India Company's service. He was soon attracted to the study of Oriental languages, particularly Sanskrit, and did an important work towards facilitating such study by founding a printing press for these languages, taking a large personal share in the practical work of
WILKINS, G.—WILKINSON, J.

preparing the type. He returned to England in 1786, but con-
tinued his study of Sanskrit, and he afterwards became librarian
to the East India Company, and examiner at Haileybury on the
establishment of the college there in 1805. Wilkins was knighted in
1833 in recognition of his services to Oriental scholarship, and
he died in London in 1836. He was a pioneer in the department
of learning with which his name was associated, being the first
Englishman to acquire masterly knowledge of Sanskrit, and to make a
thorough study of Indian inscriptions in that script. He compiled
a Sanskrit grammar and published several translations from the
sacred books of the East, besides preparing a new edition of
Richardson's Persian and Arabic dictionary, and a catalogue of the
manuscripts collected by Sir William Jones, who acknowledged
his indebtedness to Wilkins, and with whom the latter assisted
in founding the Asiatic Society of Bengal.

WILKINS, GEORGE (c. 1607), English playwright and
pamphleteer, is first mentioned as the author of a pamphlet on the
Three Miseries of Barbary, which probably dates from 1604.
He was associated with the King's Men, and was thus a colleague
of Shakespeare. He was chiefly employed in remodelling old
plays. He collaborated in 1607 with William Roweley and John
Day in The Travails of the Three English Brothers. In the
same year a play was produced which was apparently entirely
Wilkins's work. It is The Miseries of Inforst Mariage, and
treats the story of Walter Calverley, whose identity is thinly
veiled under the name of 'Scarborough.' This man had killed
his two children and had attempted to murder his wife. The
play had originally a tragic ending, but as played in 1607 ended
in comedy, and the story stopped short before the catastrophe,
perhaps because of objections raised by Mrs Calverley's family,
the Cobhams. The crime itself is dealt with in A Yorkshire
Tragedy, which was originally performed with three other plays
under the title of All's One. It was entered on the Stationers' Register in 1608 as 'written by William Shakespeare,'
published with the same ascription in that year, and reprinted in
1619 without contradiction of the statement. Mr Sidney Lee
assigns to George Wilkins a share in Shakespeare's Pericles and
collaborates in Timon of Athens. Delius conjectured that Wilkins
was the original author of Pericles and that Shakespeare
remodelled it. However that may be, Wilkins published in 1608
a novel entitled The Painfull Advances of Pericles, Prince of
Tyre, being the true history of Pericles as it was lately presented
by . . . John Gower, which sometimes follows the play very
closely.

Mr Flesy (Biog. Chron. of the Drama) says that the external
evidence about the authorship of Shakepearean authors of the Yorkshire
plays cannot be impugned, and in the absence of other authorship
cannot be lightly set aside, but he does not abandon the hope of establishing
a contrary opinion. Both Mr Flesy and Professor A. W. Ward
(Eng. Drama, 1842) seem to think that the story of Pericles was a complete original play by Shakespeare, and that the
remodelling story should be reversed, i.e. that Pericles is a Shake-
sperean play remodelled by a playwright, possibly Wilkins. Mr
Lee (Dist. Nat. Biog., Art. Wilkins) says the Yorkshire Tragedy
was 'fraudulently assigned' to Shakespeare by Thomas Pavier, the
publisher.

WILKINS, JOHN (1614-1672), bishop of Chester, was born
at Fawsley, Northamptonshire, and educated at Magdalen Hall,
Oxford, ordained and became chaplain of the Earl of Pembroke in 1637,
but soon resigned and became chaplain successively to Lord Saye
and Sele, Lord Berkeley, and Prince Charles Louis, nephew of Charles I., and afterwards elector palatine of the Rhine. In 1648
he became warden of Wadham College, Oxford. Under him the
college was extraordinarily prosperous, for, although a supporter
of Cromwell, he was in touch with the most cultured leaders,
who placed their sons in his charge. In 1659 Richard Cromwell
appointed him master of Trinity College, Cambridge. At the
Restoration in 1660 he was deprived, but appointed prebendary of York and Vicar of Cranford, Middlesex. In 1661 he was
preacher at Gray's Inn, and in 1662 vicar of St Lawrence Jewry,
London. He became vicar of Polesbrook, Northamptonshire,
in 1666, prebendary of Exeter in 1667, and in the following year
prebendary of St Paul's and bishop of Chester. Possessing strong
scientific tastes, he was the chief founder of the Royal Society
and its first secretary. He died in London on the 19th of November 1672.

The chief of his numerous works is an Essay towards a Real
Character and a Philosophical Language (London, 1668), in which he ex-
pounds a new universal language for the use of philosophers. He is
remembered also for a curious work entitled The Discovery of a
World in the Moon (1638, 3rd ed., with an appendix-"The possibility
of a passage thither," 1640). Other works are A Discourse concerning
a New Planet (1640); Mercury, or the Secret and Swift Messenger
(1641), a work of some importance to the means of rapid correspond-
ence; and Mathematical Magick (1648). See P. A. Wright Henderson, The Life and Times of John Wilkins (1910), and also the article AERONAUTICS.

WILKINS, MARY ELEANOR (1826— ), American novelist,
was born in Randolph, Massachusetts, on the 7th of January
1826, of Puritan ancestry. Her early education, chiefly from
reading and observation, was supplemented by a course at
Mount Holyoke Seminary; South Hadley, Mass. Her home was
in her native village and in Brattleboro, Vermont, until her
marriage in 1902 to Dr Charles M. Freeman of Metuchen, New
Jersey. She contributed poems and stories to children's magazines, and published several books for children, including
Young Lucretia and other Stories (1892), The Pot of Gold and
other Stories (1892), and Once upon a Time and other Child
Verses (1897). For older readers she wrote the following volumes
of short stories: A Humble Romance and other Stories (1887),
A New England Nun and other Stories (1891), Silence and other
Stories (1898), three books which gave her a prominent place
among American short-story writers: The People of Our Neigh-
borhood (1898), The Love of Parson Love and other Stories (1900),
Understudies (1901) and The Givers (1904); the novels Jane
Field (1892), Pembroke (1894), Madelon (1896), Jerome, a Poor
Man (1897), The Jamesons (1899), The Portion of Labor (1901)
and The Debor (1905); and Giles Corey, Yeoman (1893), a prose
tragedy founded on incidents from New England history. Her
longer novels, though successful in the portrayal of character,
lack something of the unity, suggestiveness and charm of her
short stories, which are notable contributions to modern American
literature. She deals usually with a few traits peculiar to the
village and country life of New England, and she gave literary
permanence to certain characteristics of New England life which
are fast disappearing.

WILKINSBURG, a borough of Allegheny county, Pennsyl-
vania, U.S.A., immediately E. of Pittsburg, of which it is a
residential suburb. Pop. (1890) 4060; (1900) 11,886, of whom
1336 were foreign-born and 275 were negroes; (1910 census
8692. Wilkinsburg is served by the Pennsylvania railway and
by interurban electric lines. It is a post-station of Pittsburg.
It is a prosperous borough and a centre of the borough of
Aged Persons (1882), the United Presbyterian Home for the
Aged (1879), and Columbia hospital (1908). Settled in 1798 and
known first as McNairville and then as Rippeyville, the place was
named about 1840 in honour of William Wilkins (1779-1865), a member of the United
States Senate in 1831-1834, minister to Russia in 1834-1835,
a representative in Congress in 1843-1844, and secretary of
war in President John Tyler's cabinet in 1844-1845. In 1887
Wilkinsburg was incorporated as a borough.

WILKING, JOHN (1775-1825), American soldier and
adventurer, was born in Calvert county, Maryland, in 1775.
At the outbreak of the War of Independence he abandoned the
study of medicine to enter the American army, and he served with
General Benedict Arnold in the Quebec campaign and was
later under General Horatio Gates, acting from May 1777 to
March 1778 as adjutant-general of the Northern Department.
He was sent to Congress to report Gates's success against Bur-
goyne, but his tardiness secured for him a sarcastic reception.
Gates recommended him for a brigadier-general's commission,
which he received, but he was not actually promoted, and
succeeded in gaining it, but their friendship was broken by the collapse
of the Conway Cabal against Washington in which both were
implicated and about which Wilking had indirectly blabbed.
Wilking then resigned (March 1778) his newly-acquired
commission, but later re-entered the service in the quartermaster-
Wilkinson, J. J. G.—Wilkinson, J.

647

general's department, and was clothier-general from July 1779 to March 1781.

In common with many other army officers Wilkinson now turned toward the West, and in 1784 settled near the Falls of the Ohio (Louisville), where he speedily became a prominent military and commercial man of considerable influence. He began to take an active part in the movement for separate statehood for Kentucky, and in 1787 he entered into an irregular commercial agreement with the Spanish officials of Louisiana. At this time, as his own papers in the Spanish archives show, he took an oath of allegiance to Spain and began to intrigue with his fellow-Kentuckians to detach the western settlements from the Union and bring them under the influence of the Louisiana authorities. His commercial connections at New Orleans enabled him to hold out the lure of a ready market at that port for Kentucky products, and this added greatly to the strength of the separatist movement. He neutralized the intrigues of certain British agents who were then working in Kentucky. For these various services he received until 1800 a substantial pension from the Spanish authorities, being officially known in their correspondence as "Number Thirteen." At the same time he worked actively against the Spanish authorities, especially through Philip Nolan. Wilkinson's ventures were not as lucrative as he hoped for, and in October 1791 he was given a lieut.-colonel's commission in the regular army, possibly, as a contemporary suggested, to keep him out of mischief. During this year he took an active part in the minor campaign which preceded General Arthur St Clair's disastrous defeat by the Indians. As brigadier-general (from March 1792) and second in command, he served under General Anthony Wayne in the latter's successful campaign of 1794 against the Indians, and in this campaign he seems to have tried to arouse discontent against his superior among the Kentucky troops, and to have intrigued to supplant him upon the reduction of the army. Upon Wayne's death in 1795, Wilkinson became general in command of the regular army, retaining his rank as brigadier and likewise his Spanish pension. He seems to have tried to stir up both the Indians and the Spaniards to prevent the survey of the southern boundary of the United States in 1797 and 1798, and succeeded in delaying Commissioner Andrew Ellicott for several months in this important task. At the same time he protégé, the fabuliste, Philip Nolan, was engaged in a reconnaissance for him west of the Mississippi.

In 1803 Wilkinson was one of the commissioners to receive Louisiana from France, and in 1805 became governor of that portion of the Purchase above the 33rd parallel, with headquarters at St Louis. In his double capacity as governor of the Territory and as merchant and land speculator he made marked his hold on Jefferson, and favourably situated upon the frontier remote from the centre of government, he attempted to realize his ambition to conquer the Mexican provinces of Spain. For this purpose in 1805 he entered into some sort of agreement with Aaron Burr, and in 1806 sent Z. M. Pike to explore the most favourable route for the conquest of the south-west. Before his agent returned, however, he had betrayed his colleague's plans to Jefferson, formed the Neutral Ground Agreement with the Spanish commander of the Texas frontier, placed New Orleans under martial law, and apprehended Burr and some of his accomplices. In the ensuing trial at Richmond the prisoners were released for lack of sufficient evidence to convict, and Wilkinson himself emerged with a much damaged reputation.

He was then subjected to a series of courts-martial and congressional investigations, but succeeded so well in hiding traces of his duplicity that in 1812 he resumed his military command at New Orleans, and in 1813 was promoted major-general and took possession of Mobile. Later in this year he made a most miserable fiasco of the campaign against Montreal, and this finally brought his military career to a dishonorable end. For a time he lived upon his plantation near New Orleans, but later appeared in Mexico City as an applicant for a land grant. Incidentally acting as agent for the American Bible Society. Here on the 28th of December 1825 he succumbed to the combined effects of climate and of opium.

See Wilkinson's Memoirs of My Own Time (Philadelphia, 1816); uncomplimentary and to be used with caution; when he said, "Wilkinson and the Beginning of the Spanish Conspiracy," in American Historical Review, vol. ix. (New York, 1904). (I. J. C.)

Wilkinson, James John Garth (1812-1869), Swedish-borgian writer, the son of James John Wilkinson (died 1845), a writer on mercantile law and judge of the County Palatine of Durham, was born in London on the 3rd of June 1812. He studied medicine, and set up as a homoeopathic doctor in Wimpole Street in 1834. He was early attracted by the works of William Blake, whose Songs of Experience he endeavoured to interpret, and of Swedenborg, to the elucidation of whose writings he devoted the best energies of his life. Between 1840 and 1850 he edited Swedenborg's treatises on The Doctrine of Charity, The Animal Kingdom, Outlines of a Philosophical Argument on the Infinite, and Hieroglyphic Key to Natural and Spiritual Mysteries. Wilkinson's preliminary discourses to these translations and his criticisms of Coleridge's comments upon Swedenborg displayed a striking aptitude not only for mystical research, but also for original philosophic debate. The vigour of his thought won admiration from Henry James (father of the novelist) and from Emerson, through whom he became known to Carlyle and Froude; and his speculation further attracted Tenenzyon, the Ophiliants and Edward Maitland. He wrote an able sketch of Swedenborg for the Penny Cyclopaedia, and a standard biography, Emanuel Swedenborg (published in 1846); but interest in this subject has since waned, and Wilkinson's work has been little noticed, and even ignored.

He was a traveller, a linguist, well versed in Scandinavian literature and philology, the author of mystical poems entitled Improvisations from the Spirit (1857), a social and medical reformer, and a convinced opponent of vivisection and also of vaccination. He died at Finchley Road, South Hampstead, where he had resided for nearly fifty years, on 18th October 1890. He is commemorated by a bust and portrait in the rooms of the Swedishborgian Society in Bloomsbury Street, London.
WILKINSON, SIR J. G.—WILL

tubes, cylinders and iron work required for the Paris water-works, the most formidable undertaking of the day. He also erected the first steam engine in France, in connexion with these works. Wilkinson is said to have anticipated by many years the introduction of the hot blast for furnaces, but the leathern pipes, then used, scorched, and it was not a success. His were the first coal-cutting machines. He proposed and cast the first iron bridge. It connected Broseley and Madeley, across the Severn, and its span of 100 ft. 6 in. was considered a triumphal wonder. Wilkinson was now a man of great means and greater influence. He issued tokens of copper, bearing his likeness and on the reverse a forge and tools of the trade, silver coins for 3s. 6d., and also pound notes, as other tradesmen of that day did. He never wrote a letter without using the word iron, indeed he was iron-minded, and provided by will that he should be buried in an iron coffin, preferably in his garden at Castle Head, near Lindal. He died on the 14th of July 1808.

Wilkinson was twice married without issue. His very large property was frittered away during a lawsuit brought by a niece against the illegitimate children whom he had named as his heirs. It was carried from various courts in the kingdom to the House of Lords and then to the Court of Chancery. Here Lord Eldon decided for the defendants, thus reversing all previous decisions taken upon the law of the case.

WILKINSON, SIR JOHN GARDNER. (1797–1873). English traveller and Egyptologist, was born on the 5th of October 1797, the son of the Rev. John Wilkinson, a well-known student of antiquarian subjects. Having inherited a sufficient income from his parents, who died when he was young, he was sent by his guardian to Harrow in 1813, and to Exeter College, Oxford, in 1816. He took no degree, and, suffering from ill-health, went to Italy, where he met Sir William Cell, and resolved to study Egyptology. Between 1821 and 1833 he travelled widely in the Nile Valley and began to publish the results. He returned to England in 1833 for the sake of his health, was elected fellow of the Royal Society in 1834, published The Topography of Thebes and General Survey of Egypt (1835) and Manners and Customs of the Ancient Egyptians (3 vols., 1837), and on the 26th of August 1839 was knighted by the Melbourne ministry. In 1842 he returned to Egypt and contributed to the Journal of the Geographical Society a chapter entitled "Survey of the Valley of the Natron Lakes." This appeared in 1843, in which year he also published an enlarged edition of his Topography, entitled Moseiim Egypt and Thebes, a work afterwards reissued in Murray's series. During 1843 he travelled in Montenegro, Bosnia and Herzegovina, an account of his observations being published in 1845 (Dalmatia and Montenegro, 2 vols.). A third visit to Egypt in 1848–1849 resulted in a further article in the Journal, "On the Country between Wady Halfah and Jebel Berkel" (1851); in 1855 he again visited Thebes. Subsequently he investigated Cornish antiquities, and studied zoology. He died at Llandovery on the 29th of October 1875. To his old school, Harrow, lie had already in 1864 presented his collections with an elaborate catalogue.

Besides the works mentioned he published Materia Hieroglyphica (Malta, 1828); Extracts from several Hieroglyphic Subjects (1830); Topography of Thebes (1854) and facsimiles of the papyrus (1854), previously edited without the writing on the back of the papyrus by Lepsius; Architecture of Ancient Egypt (1850); A Popular Account of the Ancient Egyptians (1854); important notes in Rawlinson's Herodotus, Colour and Taste (1858); articles in archaeological and scientific periodicals.

WILKINSON, TATE (1730–1803). English actor and manager, was born on the 27th of October 1730, the son of a clergyman. His first attempts at acting were badly received, and it was to his wonderful gift of mimicry that he owed his success. His imitations, however, naturally gave offence to the important actors and managers whose peculiarities he hit off to the life. Garrick, Peg Woffington, Samuel Foote and Sheridan, after being taken in the imitation, had the most angry, when it came to their turn, and threatened never to forgive him. Garrick never did. As an actor, Wilkinson was most successful in Foote's plays, but his list of parts was a long one. In Shakespearian characters he was very popular in the provinces. In 1766 he became a partner of Joseph Baker in the management of several Yorkshire theatres, and sole manager after his partner's death in 1770 of these and others. In this capacity he was both liberal and successful. He died on the 16th of November 1803. See his Memoirs (4 vols., 1790) and The Wandering Patenter (4 vols., 1795).

WILL in philosophy. The "Problem of Freedom" provides in reality a common title under which are grouped difficulties and questions of varying and divergent interest and character. These difficulties arise quite naturally from the obligation, which metaphysicians, theologians, moral philosophers, men of science, and psychologists alike recognize, to give an account, consistent with their theories, of the relation of man's power of deliberate and purposive activity to the rest of the universe. In the main, no doubt, the problem is a metaphysical problem, and has its origin in the effort to reconcile that belief in man's freedom which is regarded by the unsophisticated moral consciousness as indisputable, with a belief in a universe governed by rational and necessary laws. But the historical origin of the questions at issue is to be sought rather in theology than in metaphysics, while the discovery made from time to time by men of science of the inapplicability of natural laws or modes of operation (which they have been accustomed to regard as of universal range and necessity) to the facts or assumed facts of human activity, is a constant source of fresh discussions of the problem. Similarly the modern attempt upon the part of psychology to analyse (under whatever limitations and with whatever object of inquiry) all the forms and processes of human consciousness has inevitably led to an examination of the consciousness of human freedom: while the postulate of most modern psychologists that conscious processes are not to be considered as removed from the sphere of those necessary causal sequences with which science deals, produces, if the consciousness of freedom be admitted as a fact of mental history, the old metaphysical difficulty in a new and highly specialized form.

There is some ground nevertheless for maintaining, contrary to much modern opinion, that the controversy is fundamentally and in the main a moral controversy. It is true that the precise relation between the activities of human wills and other forms of activity in the natural world is a highly speculative problem and one with which the ordinary man is not immediately concerned. It is true also that the ordinary moral consciousness accepts without hesitation the postulate of freedom, and is unaware of, or imperfectly acquainted with, the speculative difficulties that surround its possibility. Moreover, much work of the highest importance in ethics in modern as well as ancient times has been completed with but scanty, if any, reference to the subject of the freedom of the will, or upon a metaphysical basis compatible with most of the doctrines of both the rival theories. The determinist equally with the libertarian moral philosopher can give an account of morality possessing internal coherence and a certain degree of verisimilitude. Yet it may be doubted (1) whether the problem would ever have arisen at all except for the necessity of reconciling the theological and metaphysical hypotheses of the omniscience and omnipotence of God with the needs of a moral universe: and (2) whether it would retain its perennial interest if the incursions of modern scientific and psychological inquiry into the domain of human consciousness did not appear to come into conflict from time to time with the presuppositions of morality. The arguments proceeding from either of the disputants by means of which the controversy is debated may be largely or almost wholly speculative and philosophical. But that which produces the rival arguments is primarily a moral need. And there are not wanting signs of a revival in recent years of the earlier tendency of philosophical speculation to subordinate the necessities of metaphysical, scientific, or moral inquiries to the prima facie demands of the moral consciousness.

There is no trace of the emergence of the problem of freedom
in any intelligible or distinct form in the minds of early Greek physicists or philosophers. Their doctrines were mainly based upon a belief in the government of the universe by some form of physical necessity, and, though different opinions might prevail as to the mode of operation of the various forms of physical necessity the occasional recognition in material contingency caused them to amount to a recognition of the independence of human volition or intelligence. Nor can it be seriously maintained that the problem of freedom in the form in which it is presented to the modern mind ever became the subject of debate in the philosophy of Socrates, Plato or Aristotle. It is true that Socrates brought into prominence the moral importance of rational and intelligent conduct as opposed to action which is the result of unintelligent caprice. Moral conduct was, according to Socrates, the result of knowledge while it is strictly impossible to do wrong knowingly. Vice, therefore, is the result of ignorance and to this extent Socrates is a determinist. But the subsequent speculations of Aristotle upon the extent to which ignorance invalidates responsibility, though they seem to assume man's immediate consciousness of freedom, do not in reality amount to very much more than an analysis of the conditions ordinarily held sufficient to constitute voluntary or involuntary action. The further question whether the voluntary acts for which a man is ordinarily held responsible are really the outcome of his freedom of choice, is barely touched upon, and most of the problems which surround the attempt to distinguish between modern libertarians or determinists are left unexplored. Aristotle remains content with a successful demonstration of the independence of "voluntariness" as an attribute of conduct upon knowledge and human personality. And though ultimately the attribution of responsibility for conduct is further limited to actions which are the result of purposive choice (προοπτικαί), Aristotle appears to waver between a view which regards προοπτικαί as involving an ultimate choice between divergent ends of moral action and one which would make it consist in the choice of means to an end already determined. A similar absence of discussion of the main problem at issue is noticeable in Plato. It is true that in a famous passage in the tenth book of the Republic (x. 617 ff.) he seems to make human souls responsible through their power of choice for the destinies which they meet with during their respective lives. But, as with Socrates, their power of making a right choice is limited by their degree of knowledge or of ignorance, and the vexed question of the relation of this determining intelligence to the human will is left unsolved. With the Stoic and Epicurean philosophies the problem as it shapes itself for the consideration of the modern world begins with the recognition of the immediate and absolute contingency of human action. The Stoic doctrine of determinism, as the result of the universal validity of the principles of causality, nor the Epicurean counter-assertion of freedom avoid the error of regarding chance as a real cause and universal contingency as an explanation of the universe, it was nevertheless a real step forward to perceive the existence of the problem. Moreover, the argument by means of which Chrysippus endeavoured to prove the compatibility of determinism with ethical responsibility is in some respects an anticipation of modern views. For the distinction between main and contributory causes of conduct (causa adiuvantes and causa principale-the aorov and f Cowrov of Platonc and Aristotelian philosophy) preserved the possibility of regarding character, the main cause, as the responsible and accountable element in morality. And there is much that is anticipatory of modern libertarian views in the psychological argument by which Crameddes attempted at once to avoid the Epicurean identification of will with chance, and to prove the rationality of choice, undetermined by any external or antecedent necessity, as an explanation of human actions (cf. Janet and Séailles, Hist. of Problems of Philosophy—Psychology, p. 324).

It was not until the rise of Christianity as an historical religion that the difficulty of reconciling a belief in human freedom with a belief in the Divine government of the world became apparent to its fullest extent. The Christian doctrine of the Creation at once challenged the panstist presuppositions of Hellenic thought and reinforced the belief already existing in will as a real cause. At the same time the dualism involved in the simultaneous acceptance of an optimistic account of the origin and nature of the universe (such as is implied in Christian theology) and a belief in the reality of moral evil witnessed to by the Christian doctrine of Redemption, intensified the difficulties already felt concerning man's responsibility and God's omnipotence. Neoplatonic philosophy had been in the main content either to formulate the contradiction or to deny the reality of one of the opposing terms. And traces of Neoplatonic influence, more especially as regards their doctrine of the unreality of the material and sensible world, are to be found everywhere in the Christian philosophers of Alexandria, preventing or impeding their formulation of the problem of freedom in its full scope and urgency. St Augustine was, perhaps, the first thinker to face, though not to solve, the true theological and moral difficulty inherent in Christian thought. Two lines of thought are to be traced in the most implausible hostility and contradiction throughout his system. On the one hand no thinker with more evident than Augustine the belief in individual responsibility and of will. He affirms the priority of will to knowledge and the dependence of consciousness upon physical attention. He asserts also the fact that our human power of receiving divine illumination (i.e. a capacity of spiritual insight in no sense dependent upon the creative activity of the intellect) is conditioned by our spontaneous acts of faith. And he finds in the existence of divine foreknowledge no argument for the impotence or determined character of human acts of will. The timelessness foreknowledge of the Deity foresees human actions as contingent, not as causally determined. But when Augustine is concerned to reconcile the reality of individual freedom with humanity's universal need of redemption and with the absolute voluntariness of Divine Grace, he is constrained to contradict most of those postulates of which in his advocacy of libertarianism he was an eager champion. He limits the possession of freedom to Adam, the first man, who, by abusing his prerogative, has corrupted the human race. Man as he now cannot do otherwise than evil. Inherited incapacity for the choice of good is the punishment for Adam's misuse of freedom. The possibility of redemption depends upon the bestowal of Divine Grace, which, because it is in no instance deserved, can be awarded or withdrawn without injustice. And because Adam's choice necessitates punishment it follows that in some instances Divine Grace can never be bestowed. Hence arises in Augustine's system the doctrine of Predestination (q.v.). From the theological standpoint every individual is predestined either by his natural birthright to evil or by Divine Grace to good, and the absolute foreknowledge and omnipotence of God excludes even the possibility of any initiative on the part of the individual by means of which he might influence God's timeous choice. The medieval treatment of the problem follows in the main Augustinian or Aristotelian traditional lines of thought, though successive thinkers arrive at very diverse conclusions.

Thomas Aquinas, for example, develops the Platonic argument which proves the dependence of the will upon the intellect and makes the identification of morality with knowledge. Freedom exists for Thomas, if it exists at all, only as the power of choosing what is necessarily determined by the intellect to be choiceworthy, the various possibilities of choice being themselves presented by the understanding to the will. And though in his treatise on human knowledge with human freedom, the freedom with which men act is itself the product of Divine determination. Man is predetermined to act freely, and Divine foreknowledge foresees human actions as contingent. Duns Scotus on the other
hand is the great champion of indeterminism. Upon his view the intellect must always be subordinate to the will, and to the will belongs the power of complete self-determination. Morality in effect—to such an extreme position is he driven in his opposition to the Thomists—becomes the arbitrary creation of the Divine Will and in no sense depends for its authority upon rational principles or is a form of knowledge.

The modern treatment of the problem from Descartes, Hobbes, Spinoza and Leibnitz down to Kant is too much inwoven into the metaphysical systems of individual great philosophers to afford the possibility of detailed treatment in the present article. Reference should be made either to the individual philosophers themselves or to articles on metaphysics or on ethics. Hobbes is the great exponent of materialistic determinism. Ideals and volitions are upon his view ultimately movements of the brain. Will is identified with appetite or fear, the causes of which are to be found only in the external world. Descartes advocates a kind of freedom which is apparently consistent with forms both of determinism and indeterminism. He explains the possibility of volition on the ground that the mind possesses the libertum arbitrium indifferenter and can always refuse to affirm the truth of a conclusion drawn from premises which are not self-evident. And even when the presentations before the mind are so clear that assent to their truth cannot be refused, the possibility of asent still rests with the will, which can refuse to attend to any presentation, or can refuse assent with the sole motive of proving its freedom. Spinoza is a convinced determinist regarding the will as necessarily determined by ideas.

Extension, i.e. the spatial world, and the world of consciousness are alike attributes of the one substance which can only be called free in the sense of being determined by nothing but itself. Freedom in the moral sphere consists simply in the control of the passions by reason. Leibnitz retains this attenuated belief in moral freedom and combines with it a belief in the spontaneity of moral agents in the sense that they possess the power of acting and need no other principle of action save the laws of their own natures. But inasmuch as the agreement between the acts of Leibnitz's monads is due to a divine pre-established harmony, and the theoretical contingency which in the abstract, i.e. as logically possible, can be predicated efficaciously, is in practice non-existent, Leibnitz is in effect a determinist.

Locke's treatment of the problem is in some respects more interesting than the theories of other English philosophers of his school. Freedom, according to Locke, belongs to the man, not to the will. If we will at all we are to that extent free, i.e. our actions express our purposes. If, on the other hand, we press Leibnitz's objection, i.e. that such an argument is no answer to the question whether an act of will can be free in the sense that it is not determined by reasons presented by the understanding, Locke replies that the will is in effect determined by the uncessness of desire, i.e. by the desire to avoid pain. Hume's doctrine follows logically from his theory as to the nature of causality. If our belief in necessary connexion in the physical world is in reality an illusion, it follows that the opposition between freedom and necessity will be illusory also. On the other hand if our belief in the necessity of causal connexion is the result of custom, to custom will be due also the belief in a necessity governing human actions observable everywhere in men's ordinary opinions and practice. Contrasted with this belief in necessity the supposition we have of freedom is illusory, and, if extended so as to involve a belief that men's actions do not proceed from character or habitual disposition, immoral.

Kant's theory of freedom is, perhaps, the most characteristic doctrine of his system of ethics. Distinguishing between two worlds, the sensuous and the intelligible, the phenomenal and the noumenal, Kant allows no freedom to the natural will determined by the succession of motives, desires and appetites which form the empirical and sensuous self. But in contrast with the phenomenal world governed by empirical laws Kant sets the noumenal and intelligible world in which by a timeless act of will man is free to accept the moral command of an unconditional imperative for no reason other than its own rational necessity as the deliverance of his highest nature. The difficulties of the Kantian system are mainly to be looked for in his account of the relation between the phenomenal and noumenal world.

In more recent times the controversy has been continued either with the attempted proof of determinism by the advocates of psychological Hedonism, an attempt which in the present time is generally admitted to have failed; or with the doctrine that the influence of environment in its bearing upon the development of character and the possibility of freedom. The great advance of biological knowledge in recent times though it has in no sense created a new problem (men have always been aware of the importance of racial or hereditary physical qualities in their influence upon human conduct) has certainly rendered the existence of complete individual freedom (in the sense in which it was advocated by older libertarians) in the highest degree unlikely. The advocate of freedom must, therefore, in order to maintain the relative power of influencing conduct, e.g. a power of controlling inherent temperament or subduing natural passion. Such a relative freedom, indeed, taking into account the admitted inviolability of natural laws, was from the very beginning all that they could claim.

But it was inevitable that the enormous advances made by the physical and other sciences in modern times should bring with them a reasoned attempt to bring the phenomena of consciousness within the sphere controlled by physical laws and natural necessity. There will never perhaps in any period of the world's history be wanting advocates of materialism, who find in the sensible the only reality. But the materialism of modern times is more subtle than that of Hobbes. And the determinism of modern science no longer consists in a crude denial of the reality of conscious processes, or an attempt to explain them as only a sublated form of matter and its movements; it is content to admit the relative independence of the world of consciousness, while it maintains that laws and hypotheses sufficient to explain material processes may be extended to the will be discovered to be valid of the changing sequence of conscious states of mind. Moreover, much of the apparent cogency of modern scientific determinist arguments has been derived from the unguarded admissions or timorous acquiescence of their opponents. It is not enough merely to repel the incursions of physiological science, armed with hypotheses and theories valid enough in their own sphere, upon the domain of consciousness. If the attack is to be finally repulsed it will be imperatively necessary for the libertarian to maintain that no full explanation of the physical universe can ever gain assent which does not take account of the reality and influence within the material world of human power of initiative and freedom.

Of this necessity there is a growing consciousness in recent years, and no more notable exposition of it has been published than is contained in James Ward's Naturalism and Agnosticism. Nor is there any lack of evidence of a growing dissatisfaction on the part of many physiologists with the complacent assumption that the methods of physical science, and particularly the conception of causal activity common to the sciences which study inorganic nature, can be transferred without further criticism to the examination of life and mind. Meanwhile the scientific onslaught upon the libertarian position has been directed from two chief quarters. It has been maintained, on the one hand, that any theory which presupposes a direct correspondence between the molecular movements of the brain, and the states of consciousness which accompany them must make the freedom of the will impossible. On the other hand it is asserted that quite apart from any particular view as to the relation between mind and body the existence of the freedom of the will is necessarily incompatible with the principle of the conservation of energy and is therefore in direct contradiction to...
many if not most of the assured conclusions of the physical sciences.

As regards the first of these two main contentions, it must suffice here to point out the main difficulties in which a determinist and especially materialist account of the relation between consciousness and the succession of material processes which accompany it appears to be involved. The arguments of thorough-going materialism can in most cases be met with a direct negative. No kind of evidence can be adduced sufficient to prove that consciousness is a secretion of the brain, an effect or even a consequent of material processes or modes of motion. No direct causal relationship between a molecular movement and a state of consciousness has ever been established. No physiologist has ever claimed the power to prophesy with any approach to accuracy the future mental states of any individual from an examination of his brain. And, though some kind of correspondence between the physical and conscious series of states has been observed and is commonly taken for granted in a number of instances, proof that entire correspondence exists is still wanting, and the precise kind of correspondence is left undetermined. Nevertheless, the belief that material processes must be held sufficient to account for material changes in the human organism as in all other regions of the material world, can be held quite independently of any particular theory as to the relation between mind and body, and in many of its forms is equally destructive of a belief in the freedom of the will. The mechanical hypothesis, too, which is increasingly prevalent in modern science. The theory of psychophysical parallelism involves no doubt in the minds of the majority of its upholders the further assumption of some unity underlying both the physical and psychical series which may one day be discovered to be susceptible of scientific expression and interpretation. Certainly without some such assumption the hypothesis of an exact correspondence between the series described as parallel becomes, as Professor Ward has shown, unmeaning. And many scientific thinkers, while professing allegiance to a theory which insists upon the independence of each parallel series, in reality tacitly assume the superior importance if not the controlling force of the physical over the psychical terms. 

But a mere insistence upon the complete independence of the physical series coupled with the belief that its changes are wholly explicable as modes of motion, i.e. that the study of molecular physics is competent to explain all the phenomena of life and organic movements, is sufficient to eliminate the possibility of spontaneity and free origination from the universe. For if consciousness be looked upon as simply an epiphenomenon, an unaccountable appearance accompanying the actual mechanical changes of the brain, the possibility either of active interference by human volition at any point within the physical series or of any controlling or directing efficacy of consciousness over the whole set of material changes which accompany its activity becomes unthinkable. There are, nevertheless, serious difficulties in the supposition that the changes in the brain with which physiology and the biological sciences deal can be satisfactorily explained by the mechanical and mathematical conceptions common to all these sciences, or, indeed, that all of these organic changes is susceptible in the last resort of explanation derived from physics alone. The phenomena of life and growth and assimilation have not been satisfactorily explained as mechanical modes of motion, and the fact that identical cerebral movements have not been discovered to recur makes scientific and accurate prediction of future cerebral changes an impossibility. But more convincing than most of the philosophical arguments by which the theories of psychophysical parallelism have been assailed is the fact that it runs counter to the plain evidence of the ordinary consciousness. No matter to what extent the unphilosophical thinker may be under the influence of materialistic presuppositions, he always recoils from the conclusion that the facts of his mental life have no influence upon his physical movements. Meaning, design and purpose are to him terms far more explanatory of his movements in the outer world than the mechanical and mathematical equivalents to which his actions will ultimately be reduced if the sciences should achieve their avowed purpose. To regard himself as a conscious automaton he can never be persuaded. Further, he finds in the series of antecedents and consequents capable of mathematical and spatial determination, which certain men of science present to him as their final account of his physical and psychical history, no real explanation of the facts: he is far more inclined to look for an explanation of the efficacy of causal changes in the categories of will and purpose for which they are a substitution.

Nor, finally, is the last defensive position of scientific determinism—the theory, namely, that the freedom of the will is incompatible with the doctrine of the conservation of energy—to be accepted without question. That doctrine, if it is to possess cogency as a proof of the impossibility of the libertarian position, must assume that the amount of energy sufficient to account for physical and psychical changes is constant and invariable in quantity, an assumption which no scientific investigator is competent to prove. A regulative principle which may possess great value when applied and confined to the comparatively abstract material of the mathematical and quasi-mathematical sciences is highly dangerous if extended to the investigation of living bodies. "In its present form, and since the development of the mechanical theory of heat, the principle of the conservation of energy certainly seems to apply to the whole range of physico-chemical phenomena. But no one can predict the energy which a nerve will lose in making a response and of nervous phenomena in particular, will not reveal to us, besides the *vis viva* or kinetic energy of which Leibnitz spoke, and the potential energy which was a later and necessary adjunct, some new kind of energy which may differ from the other two by rebelling against calculation" (Bergson, *Time and Free Will*, Eng. trans. by F. L. Pogson, pp. 151, 152).

It is, however, from the development of the scientific study of psychology more than from any other region of thought that light has been thrown upon the problem of freedom. The determinist or the positions of psychophysiology (determinist because they involve the application of the causal conceptions of modern science to mental phenomena) have in many instances in no way retarded the utilization of new information concerning mental processes in order to prove the reality of freedom. Bergson is perhaps the most notable instance of a philosopher fully conversant with psychological studies and methods who remains a convinced libertarian. But the contribution made by psychology to the solution of the problem has taken the form not so much of a direct reinforcement of the arguments of either of the opponent systems, as of a searching criticism of the false assumptions concerning conative processes and the phenomena of choice common alike to determinists and libertarians. It has already been pointed out that the problem as it presented itself to utilitarian philosophers could lead only to a false solution, depending as it did upon a wholly fictitious theory as to the nature of desire. There are still many traces to be found in modern psychology of a similar unreal identification of desire with will. But, nevertheless, the new light thrown upon the unity of the self and the more careful and accurate scrutiny of mental phenomena is sufficient to make the determinist or the phenomena of decision have rendered it no longer possible either for determinists to deny the fact of choice (whatever be their theory as to its nature) or for libertarians to regard the self or the will as isolated from and unaffected by other mental constituents and antecedents, and hence, by an appeal to wholly fictitious entities, to prove the truth of freedom. The self or the will can no longer be looked upon as possessing a kind of *imperium in imperio*, this way and that dividing the swift mind." And if freedom of choice be a possibility at all, it must in future be regarded as the prerogative of a man's whole personality, exhibited continuously throughout the development of his character, displayed to some extent in all conscious conative processes, though especially apparent in crises necessitating deliberate and serious purpose. The mistake of earlier advocates of determinism lay in the
supposition that self-conscious moral action could be explained by the use of the same categories and upon the same hypotheses usually considered sufficient to explain the causal sequences observable in the physical world. Conduct was regarded as the result of interaction between character and environment; or it was asserted to be the resultant effect of a struggle between motives in which the strongest prevailed. And the libertarian critic had before him a comparatively easy task when he exhibited the complete interdependence of character and environment, or rather the impossibility of treating either as determinants in a process explicable by the use of ordinary scientific categories.

It was not difficult to show that motives have meaning only with reference to a self, and that it is the self which alone has power to erect a desire into a motive, or that the attraction of an object of appetite derives much of its power from the character of the self to which it makes its appeal. What is possibly not so obvious is the extent to which libertarians have themselves been guilty of a similar fallacy. It is comparatively unimportant to the determinist whether the cause to which he attributes conduct be the self, or the will, or character, or the strongest motive, provided that each of these causes is regarded as definitely ascertainable and that its effects in sufficiently known circumstances be calculable. It is possible to treat will as a permanent cause manifesting itself through a series of sequent changes, and obedient to the laws which govern the development of the personality of the single individual.

And the libertarian, by his arguments showing that appeal must be made to an act of will or of the self in the explanation of the phenomena of choice, does nothing directly to disprove the truth of such a contention. If, however, it be argued by libertarians that no explanation is possible of the manner in which the self or the will makes its decisions and inclines to this motive or to that, while they still assert the independent existence of the self or will, then they are undoubtedly open to the retort of their opponents that upon such a theory no rational explanation of conduct will be possible. For to regard a particular decision as the effect of the "fiat" of a self or will unmotived and uninfluenced by the idea of a future object of attainment seems to be equivalent to the simple statement that the choice was made or the decision taken. Such a theory can prove nothing either for or against the possibility of freedom.

Moreover, many of the arguments by which the position of rigid libertarians of the older school has been proved untenable have been advanced by moral philosophers, and by thinkers not always inclined to regard psychology with complete sympathy. The doctrine of self-determination, advocated by T. H. Green and idealist writers of his school, has little or nothing in common with the doctrine that the self manifests its freedom in unmotived acts of will. The advocates of self-determination maintain that conduct is never determined, in the sense in which, e.g., movements in the physical world are determined, because man in virtue of his self-consciousness has a power of distinguishing himself from, even while he identifies himself with, a purely natural object of desire; and this must always make it impossible to regard him as an object governed by purely natural forces. Consciousness and especially self-consciousness, can never be explained upon hypotheses adequate only to explain the blind working of the unconscious world. But the insistence of idealist writers upon the relation of the world of nature to conscious intelligence, and especially to a universal consciousness realizing itself throughout the history of individuals, rendered it alike impossible to deny altogether some influence of environment upon character, and to regard the history of individual willing selves as consisting in isolated and unconnected acts of choice. Self-consciousness, if it be conceived as distinguishing itself from its past history or from the natural world, must be conceived also as in some sense related to the empirical self which has a history in time and to the natural organism in which it finds a home. It is the precise mode of this relation which idealist philosophers leave obscure.

Nor is that obscurity to any appreciable degree illuminated by the tendency also noticeable in idealist writers to find the true possession of freedom only in a self emancipated from the influence of irrational passion, and liberated by knowledge from the dominion of chance or the despotism of unknown natural forces. Here also psychology, by its elucidation of the important part which instinctive appetites and animal impulses play in the development of intelligence, still more perhaps by arguments (based largely upon the examination of hypnagogic subjects or the phenomena of fixed ideas) which show the permanent influence of irrational or semi-rational suggestions or habits upon human conduct, has only helped to aid andabet idealists in their contentions. It cannot in fact be denied that from one point of view human freedom is strictly relative, a possession to be won only after painful effort, exhibiting itself in its entirety only in supreme moments when the self is unswayed by habit, and out of full knowledge makes an individual and personal choice. Ideal freedom will be the supreme achievement of a self completely moralized. But the process by which such freedom is eventually to be gained must, if the prize is to be worth the having, itself exhibit the gradual development of a self whose actions are as under whatever limitations, permitted or permitted, to the liberty of choice in its early stages as it is in its latest. And no theory which limits the exercise of freedom to the choice only of what is strictly good or rational can avoid the imputation of destroying man's responsibility for the choice of evil.

But the most important point at issue between the opposing theories has remained throughout the history of the controversy, the morality or immorality of their respective solutions to the ethical problem. The advocates of either theory must in the last resort appeal to the direct evidence of the moral consciousness. It remains to give a brief sketch of the arguments advanced on either side.

It has always been maintained by convinced libertarians that without a belief in the freedom of the will morality becomes unmeaning (see determinism). Moreover, without a belief in the freedom of the will the conception of moral obligation upon which the existence of morality depends and from which all other moral terms derive their meaning loses its chief significance. What is opposed to obligation, or at least always distinguished from it, is that very domain of necessity within which determinism would be the only or the determining factor. If there is no obligation absolute, where the will is completely moralized, where it is inconceivable in the case of a good man that the act which he performs should be other than it is, there the obligation which he recognizes is an obligation to choose autonomously, and as such is distinguished from desire or appetite or any of the other alleged determinants of action. If the question be asked: "Where is the evidence for this alleged freedom to choose between alternatives?" the appeal is always made to the witness of the moral consciousness itself. No one, it is said, who ever feels remorse for the committal of a wrong act can honestly avoid the admission that at the moment when the act was committed he could have acted otherwise. No one at the moment of action is ever aware that his will is being necessitated. What he is clearly conscious of is the power to choose. Any proof, in the scientific sense, that a man's acts are due to his power of free initiative would be from the nature of the case impossible. For, inasmuch as scientific proof depends upon the evidence of causality, such efforts after scientific demonstration would end only by bringing either the man's whole personality or some factor in it within the sequence of the chain of natural causes and effects, under the domination of that natural necessity from which as a conscious being he is free. The science of morality must be content in its search for causes to recognize the rationality of choice as a real determining agent in human affairs. And no account of the psychology of human action which regards conduct as due to self-determination, but leaves open the question whether the self is free to choose is, so it is argued, capable of providing an adequate theory of the admitted facts of moral consciousness.

We must now consider the arguments by which determinists
attacked the position of his opponents and the evidence which they adduce to show that the freedom of the will is no necessary postulate of moral action. Moral determinism of the older type the dependence of morality upon freedom did not of necessity prove an obstacle.

Hedonistic psychology denied the libertarian hypothesis, but it denied also the absoluteness and intuitive character of moral obligation, and attested no validity to the ordinary interpretation of terms like "ought" and duty. Modern determinists differ from the earlier advocates of their theory in their endeavour to exhibit at least the compatibility of morality with the absence of freedom, if not the enhancement of moral values which, according to some of its advocates, follows upon the acceptance of the deterministic account of conduct.

If a coherent theory capable of giving an explanation of the ordinary facts of morality and not involving too violent a breach with the meaning of moral terms in their accepted usage were all that need be required of determinists in order to reconcile the defenders of the moral consciousness to the loss of their belief in the will's freedom, it would follow without question that the determinists have proved their case. Neither the deterrent nor the reformationary theories of punishment (q.v.) necessitate the abolition of personal freedom in the freedom of the will. On the contrary, a belief that conduct is necessarily determined, in the presence of certain motives, and that upon the application of certain incentives, whether of pain or pleasure, upon the presence of certain stimuli, is as necessary to the shaping of the actions of a character will necessarily ensue, would seem to vindicate the rationality of the ordinary penal legislation, if its aim be deterrent or reformationary, to a far greater extent than is possible upon the libertarian hypothesis. Humanitarian moralists, who hesitate to believe in the retributive theory of punishment because, as they think, its aim is not the criminal's future well-being but merely the vindication of the law, would find a plausible point upon which to base the rationality of the criminal need never have committed, might welcome a theory which urges that the sole aim of punishment should be the exercise of an influence determining the criminal's future conduct for his own or public advantage. Moreover, the belief that the justice of punishment depends upon the responsibility of the criminal for his past offences and the admission of the moral consciousness that his previous wrong-doing was due to his own act because it is so, and that his punishment is deserved by reason of his very act alone, would make the libertarian moralist willing to accept retribution. For whatever may have been the character of the individual in the past, it is possible upon the libertarian view that by the exercise of his freedom he has brought about in himself a complete change of character: he may be now the exact opposite in character of what he was then. Upon what grounds, therefore, shall we discriminate between acts and the moral responsibility for their commission when he was at a previous period in his life and the injustice of forgiving him because of what he is in the present? While if the deterrent and reformationary theories alone provide a rational basis for punishment to aim at then the libertarian hypothesis fails, it cannot be that all punishments equally useless. For no punishments can prevent the individual from becoming a person of whatsoever character he chooses, or from enjoying the product of acts of which determines to prefer. A similar line of argument would lead to the conclusion that the conception of the state as an educating, controlling and civilizing agency involves the belief that individual citizens can be influenced and directed by motives which have their origin in external suggestion, i.e. that the determinist theory alone provides a rational basis for state activity of whatever kind.

It might, however, be thought that whatever be the compatibility of theories of punishment or of the activity of the state as a moralizing agency with determinism, to reconcile the denial of freedom with a belief in the reality of remorse or penitence would be a serious objection to its adoption. Men's moral responsibility and tendency on the part of modern determinists to evade the difficulty. They argue with considerable cogency that determinism is very far from affording any ground for believing in the impotence of will. They believe that an action which determines a person's moral character in the future may be as yet unanalysed and unappreciated, but which can be must intrusive analysis the hidden elements in his personality. The existence of feelings of remorse and penitence testify to the presence in the human frame of other elements of an individual, which, if good, are the causes of and act in the same manner as the determinists' contention. For they are the natural and logical consequences of the acts which the penitent deplores. Such feelings and the good acts of a character in a consciousness sufficiently moralized as incalculably as pain in the.

natural world follows upon the violation of one of nature's laws. And they would lose a great part of their significance if they did not testify to the continued existence in a man's personality of motives and tendencies likely to influence his conduct in the future as they have in the past. They have, however, a deeper rational explanation of the idea of responsibility itself upon determinist assumptions. To hold to a person to be a responsible agent is to believe that he possesses a certain stability and character of nature from which his actions issue. Now it sometimes seem to lead to the conclusion that free agents are irresponsible, unaccountable. The truth seems to be that throughout the history of the controversy the chief arguments for either side have been pressed upon the external events; the most important of such arguments being to demonstrate that the actions of his opponents have been driven in the presentation of their case. So long as libertarians contend that what alone possesses moral value is the character of the action, at least, and when they bring the saving the arbitrary flat of individual selves at the moment of decision, it is difficult for determinists to exhibit the absurdities to which their arguments lead. It can easily be shown that men do as a matter of fact act on their moral desires, the environment, nor the influence of determinist account of conduct.

Punishment.

Moreover, the belief that the justice of punishment depends upon the responsibility of the criminal for his past offences and the admission of the moral consciousness that his previous wrong-doing was due to his own act because it is so, and that his punishment is deserved by reason of his very act alone, would make the libertarian moralist willing to accept retribution. For whatever may have been the character of the individual in the past, it is possible upon the libertarian view that by the exercise of his freedom he has brought about in himself a complete change of character: he may be now the exact opposite in character of what he was then. Upon what grounds, therefore, shall we discriminate between acts and the moral responsibility for their commission when he was at a previous period in his life and the injustice of forgiving him because of what he is in the present? While if the deterrent and reformationary theories alone provide a rational basis for punishment to aim at then the libertarian hypothesis fails, it cannot be that all punishments equally useless. For no punishments can prevent the individual from becoming a person of whatsoever character he chooses, or from enjoying the product of acts of which determines to prefer. A similar line of argument would lead to the conclusion that the conception of the state as an educating, controlling and civilizing agency involves the belief that individual citizens can be influenced and directed by motives which have their origin in external suggestion, i.e. that the determinist theory alone provides a rational basis for state activity of whatever kind.

It might, however, be thought that whatever be the compatibility of theories of punishment or of the activity of the state as a moralizing agency with determinism, to reconcile the denial of freedom with a belief in the reality of remorse or penitence would be a serious objection to its adoption. Men's moral responsibility and tendency on the part of modern determinists to evade the difficulty. They argue with considerable cogency that determinism is very far from affording any ground for believing in the impotence of will. They believe that an action which determines a person's moral character in the future may be as yet unanalysed and unappreciated, but which can be must intrusive analysis the hidden elements in his personality. The existence of feelings of remorse and penitence testify to the presence in the human frame of other elements of an individual, which, if good, are the causes of and act in the same manner as the determinists' contention. natural world follows upon the violation of one of nature's laws. And they would lose a great part of their significance if they did not testify to the continued existence in a man's personality of motives and tendencies likely to influence his conduct in the future as they have in the past. They have, however, a deeper rational explanation of the idea of responsibility itself upon determinist assumptions. To hold to a person to be a responsible agent is to believe that he possesses a certain stability and character of nature from which his actions issue. Now it sometimes seem to lead to the conclusion that free agents are irresponsible, unaccountable. The truth seems to be that throughout the history of the controversy the chief arguments for either side have been pressed upon the external events; the most important of such arguments being to demonstrate that the actions of his opponents have been driven in the presentation of their case. So long as libertarians contend that what alone possesses moral value is the character of the action, at least, and when they bring the saving the arbitrary flat of individual selves at the moment of decision, it is difficult for determinists to exhibit the absurdities to which their arguments lead. It can easily be shown that men do as a matter of fact act on their moral desires, the environment, nor the influence of
acts of a certain character. But even with regard to the expediency of such punishments we may have doubts. For the very argument from the undeveloped possibilities of such man's character by which the determinist proves the compatibility of his theory with the phenomenon of sudden conversion and the like is sufficient also to prove that the state of his character after the punishment is such that the individual will have the effect upon his character and conduct which it desires. It may be replied that experience makes it reasonably certain that the infliction of certain penalties will produce an effect upon the character of the individual, and that this effect upon conduct may be established as reasonably probable by induction. But when the data are admittedly so uncertain is a valid inductive argument of such a character possible? And even if it were what would be its bearing upon the justice of the injustice of inflicting punishments at all? The unsophisticated moral consciousness will still consider it unjust to punish a man for deeds of which he will not avoid the performance, and regard the alleged desire to produce in his future life consequences favourable to himself or society as beside the mark and irrelevant to the question at issue.

At the moment of action the individual invariably regards himself as free to choose between alternatives. This immediate consciousness of freedom persists upon an occasion even though subsequent reflection upon conduct should lead the individual to regard himself as determined at the very moment when he was aware of himself as free. It is this immediate consciousness of the power of choosing between alternatives which the determinist finds so difficult to explain. He may regard it as an illusion, and attempt to prove the incompatibility of our consciousness of freedom with the facts of existence and the nature of the world. But, in ordinary cases of illusion, once let the reason for the illusion be discovered and then there is no longer the illusion of our being longer deceived. The phenomena which deceived us may continue to persist, but they no longer persist as illusion; the appearance which deceived us is seen in its true nature, even though it should still retain those characteristic marks or signs of reality which hitherto we regarded as significant of a nature which we now no longer believe it to possess. But can it be maintained that the same truth holds good of our consciousness of freedom? Is it possible to hold that determinist arguments are of so convincing a character as to enable us to perceive at the moment of the action the untrustworthy nature of our consciousness of freedom? But, if we are to suppose that our past acts were determined, that desire of pleasure or the wish to avoid pain controlled our will, the unphilosophical observer interprets, in offenders against morality, such arguments as a mere excuse. Moreover, reminiscence and evidence are witnesses in the wrongdoer to the truth of the interpretation. On the other hand we have no such immediate consciousness of the necessity which is said to control our wills. We sharply distinguish that freedom which is the prerogative of human action from the necessary causation discoverable in nature. Within the domain of human consciousness retrospective analysis is unable to discover those chains of necessary sequences which it is the province of science to investigate in the physical world. And until the determinist can successfully explain to us how in a world obeying throughout its history necessary laws and limited in its nature to the exhibition of causal sequences the consciousness of freedom could ever have arisen, we may be content to trust the immediate affirmation of our moral selves.

**WILL**

**WILL,** or Testament, the legal documentary instrument by which a person regulates the rights of others over his property or family after his death. 1 For the devolution of property not disposed of by will, see Inheritance, Intestacy. In strictness "will" is a general term whilst "testament" applies only to dispositions of personalty; but this distinction is seldom maintained in practice. The court of Hastingstow will, familiar as it is in modern England, is by no means, in fact, complete freedom is the exception rather than the rule. Legal systems which are based upon Roman law, such as those of Scotland and France, allow the whole property to be alienated only where the deceased leaves no widow or near relatives. In France this restriction has met with condemnation from eminent legal and economical authorities. R. T. Treglown, for instance, held that "un peuple n'est pas libre, s'il n'a pas le droit de tester, et la liberté du testament est la plus grande preuve de la liberté civile." 2

**History.**—The will, if not purely Roman in origin, at least owes to Roman law its complete development—a development which in most European countries was greatly aided at a later period by ecclesiastics versed in Roman law. In India, according to Macfarlane, 3 the earliest written Roman law was used by the Indians, who interpreted the Roman will, as the Roman law, with Mohammedan law. The early Roman will, as Sir H. Maine shows, 4 differed from the modern will in most important respects. It was at first merely a written statement of the distribution of the movable property of the deceased, and the part of the movable property which was to be disposed of by the testament; the will was in public form; and it was irrevocable. Its original object, like that of adoption, was to secure the perpetuation of the family. This was done by securing the due vesting of the heredities in a person who should be relied upon to keep up the family rites. There is much probability in the conjecture that a will was only allowed to be made when the testator had no gentiles discoverable, or when the gentiles were of their rights. It is certain from the text of Gaius 5 that the earliest form of will, in which those made in the testament, and those made in praetura, made in praetura, or in the course of battle. The former were published before the comitia, as representative of the patrician gentes, and were the subject of particular legislation in the case of the plebeian and patrician gentes. At a later time grew up a form of plebeian will (testamentum per aet titribam), and the law of succession under testament was further modified by the influence of the praetor, especially in the direction of recognition of fideicommissa or testamentary trusts. Codicilli or informal wills, also came into use, and were sufficient for almost every purpose but the appointment of an heir. In the time of Justinian a will founded partly on the jus civile, partly on the edict of the praetor, partly on imperial constitutions and so called testamentum tripertitum, was generally in use. The main points essential to its validity were that the testator should possess testamentary power, that the will should not be modified by the testator in the presence of seven witnesses, or published orally in open court. The witnesses must be idonei, or free from legal disability. For instance, women and slaves were not good witnesses. The testator might dispose of his property for life and for the life of his testator, or the lifetime of his testator, or the lifetime of his testator. The rights of heirs and descendants were protected by enactments which secured to them a legal minimum, the queria inagolasci testamenti being the remedy of those passed over. The age at which testamentary capacity began was fourteen in the case of males, twelve in the case of females. Up to A.D. 439 a will must have been in Latin; after that date Greek was allowed. Certain persons, especially the patricians, were privileged from observing the ordinary forms. The liability of the heir to the debts of the testator varied at different periods. At first it was practically unlimited. Then the law was gradually modified in his favor until the testator made it possible that the heir who duly made an inventory of the property of the deceased was liable only to the assets to which he had succeeded. This limitation of liability is generally termed by the civilians beneficiarium inventarium. Sometimes the like in the English probate is to be found in the rules for breaking the seals of a will in presence of the praetor. Closely connected with the will was the donatio mortis causa, the rules of which have been as a whole adopted in England (see below). An immense series of codicilli in the Code Carolini and the Corpus Iuris Canonici is, as a rule, not alienated to the whole of part v. of the Digest (books xxviii.-xxxvi.) deals with the subject, and so do a large number of constitutions in the Code and Xantippe.

1 This is practically in accordance with the definition of Modestinus in Digest xxvii. 1, i. 13, volutati nostrae justa sententia de eo quid post mortem suam fuerit vellet.

2 Traité des donations entre-vifs et des testaments (1855), preface.

3 Les Lettres, chap. vi. 11. 101.

4 Hist. of Roman Law, 1.
early as Constantine, and heretics and monks were placed under a disability to make a will or take gifts left by will. A will was often deposed in a church. The canon law was favorable to this because it was to the advantage of the Church.

No Church property could be bequeathed. Manifest users were added to the list of those under disability. For the validity of a will, the testator had to be of full age and free from the presence of a priest and two witnesses, unless where it was made in pias causas. The witnesses, as in Roman law, must be idonei. Gifts to the Church were not subject to the deductions in favour of the heir nor were they subject to the claims of creditors. A will made in a church could be, in part, modified by the Church, and the Church was not incapacitated to receive, and married women, infants, idiots and lunatics to devise. An act of 1660, by abolishing tenure by knight service, made all lands devisable. In the same reign the Statute of Frauds (1660) enacted that no contract should be enforced unless it was made in writing and signed by both parties. There was a time when even the handwriting of another person, constituted a sufficient will, if published by the testator as such. The Statute of Frauds required, inter alia, that all devises should be in writing signed by the person whose devise is made, and made in the presence and by his direction, and should also be subscribed by three or four credible witnesses. The strict interpretation by the courts of the credibilitas of such witnesses held good until the 1751–1752, making interested witnesses sufficient for the due execution of the will, but declaring gifts to them void. The will of a man was revoked by marriage and the birth of a child, of a woman by marriage and the birth of a child. A will revoked by the birth of a child would have effect only against such child, and even by a void conveyance inter vivos of land devised by the will made subsequently to the date of the will, which was presumed to be an attempt by the grantor to give legal effect to a change of intention. As in Roman law, a will spoken from the time of the making, so that it could not avail to pass after-acquired property without republication, which was equivalent to making a new will. A written will need not be "credibile," i.e., be witnessed, but could be rendered to the use of the will of the copyhold tenant; an act of 1815 made them devisable simply. Devises of lands have gradually been made liable to the claims of creditors by a series of statutes beginning 1752.

The history of wills of personality was considerably different, but to some extent followed parallel lines. In both cases partial preservation of pre-Christian property and the consolidation of ideas of personal freedom and personal property. The opinion of the best authorities is that by the common law of England a man could only dispose of his whole personal property if he left no wife or children; if he left either wife or children he could not dispose of them without the will. In the case of a will in the presence of witnesses and even by a void conveyance the devise of land made by the will was void. In the case of the will, the will of a man was revoked by marriage and the birth of a child, of a woman by marriage and the birth of a child. A will revoked by the birth of a child would have effect only against such child, and even by a void conveyance of land devised by the will made subsequently to the date of the will, which was presumed to be an attempt by the grantor to give legal effect to a change of intention. WILL

The Judicature Acts 1873 and 1875 and the Land Transfer Act 1897. All but the acts of 1873 and 1875 deal mainly with what has happened after death. They are set under the voluntary or contentious jurisdiction of the Probate Division (see Prorate).

Some of the earlier acts are still law, though of little importance since the more modern and comprehensive enactments.

The earliest on the statute roll is an act of Henry III. (1263), enabling a widow to bequeath the crops of her lands. Before the Wills Act uniformity in the law had been urgently recommended by the Blackstone Commission and had been adopted by the Court of Chancery. A rather mischievous report is that at the time of its appearance there were ten different ways in which a will might be made under different circumstances.

The act of 1857 affected both the making and the interpretation of wills. It extended for the first time the operation of its enactments to seafarers, and it also bequeathed the court rolls, which were to be made by any person under the age of twenty-one is valid. Every will is to be in writing, signed at the foot or end thereof by the testator or by some person in his presence and by his direction, and such signature is to be made or acknowledged by the testator in the presence of two or more witnesses present at the same time, who are to subscribe the will in the presence of the testator. It is usual for the testator and the witnesses to sign every will, although it is not necessary. Misinterpretation of the importance of a will, if it is to be valid, or to a witness to a will, is not necessary. Gifts to a witness or the husband or wife of a witness are void. A creditor or executor may attest. A will is revoked (except where made in contemplation of marriage) by the testator's death, by renunciation, or by destruction, with the intention by the testator's death, or by destruction, with the intention of revoking, but not by pre-emption arising from an alteration in circumstances. Alterations in a will must be executed and attested as a will. A will speaks from the date of its execution, unless the intention to make a will is evidenced by an unattested document may be, if properly identified, incorporated in a will, but such a document, if executed subsequently to the will, is invalid.

Rules of interpretation or construction depend chiefly on decisions of the courts, to a smaller extent on statutory enactment. The law was gradually brought into its present condition through pre-annelian enactments extending back for centuries, especially decisions of the Court of Chancery, the court par excellence of construction, as distinguished from the court of probate. The court of probate did not deal unless incidentally with the meaning of the will; its jurisdiction was not necessarily limited to the interpretation of a will, but its present state of the law of interpretation is highly technical. Some phrases have obtained a conventional meaning which the testators who used them probably did not dream of. Many of the judicial doctrines which had gradually become established were altered by the Wills Act. These provisions of the act have since that time themselves become the subject of judicial decision. Among other provisions are these, most of them to take effect only in the absence of a contrary intention. A residuary devise is to include estates comprised in lapsed and void devises. A general gift of the testator's lands is to include such lands and other heritable property of the testator. A gift of an estate to take effect in whole or in part at the death of the person whose issue was named, not as before the act, an indefinite failure of issue, an estate tail being thus created. Trustees under an unlimited devise are to take the fee simple. Devises of estates tail are not to lapse if the devise, though he pre- deceased the testator, left issue inheritable under the entail. Gifts to children or other issue leaving issue living at the testator's death are to lapse. Rules of interpretation founded on principles of equity independent of statute are very numerous, and for them the works devoted to the subject must be consulted. Some of the more important, stated in as general a form as possible, are these. The intention of the testator is to be observed. This rule is followed by Sir E. Coke: the pole star to guide the judges. There is a presumption against intestacy, against double portions, against constructing meaning out of words, and to import into the meaning of the words of the act is to be expounded by another. Interlineations and alterations are presumed to have been made after, not as in deeds before, execution. Words are supposed to be used in their strict and primary sense. Many words and phrases, however, such as "money," "residue," and "issue," and words of the same meaning, have become invested with technical meanings, but there has been a recent tendency to include illegitimate children in a gift to "children." Evidence is admissible in consideration of an intestate or of an intestate estate, of an antenuptial settlement, and of a settlement of the estate of a testator. Terms of a lost will may be given as in the famous case of Sugden v. Lord St Leonards (1876), 1 Prob. Div. 154.

A will in whole or in part, for many reasons, which may be divided into two great classes, arising from external circumstances and those arising from the will itself. The main examples of the former class are revocation by burning, tearing, &c., by a later will, or by marriage of the testator (except as below), incapacity of the testator from insanity, infamy or legal disability (such as being a convict), undue influence and fraud, any one of which will render the will void. It is for the testator's own death, however, that the rule against perpetuities applies. A will being ambulatory is always revocable, unless in one or two exceptional cases. Undue influence is a ground upon which a will will not be confirmed by the Court of Probate, but it may be confirmed by the Court of Chancery. It is well explained in a judgment of Lord Penzance's: "Pressure of whatever character, whether acting on the fears or the hopes, as it is exerted to overpower the will without convincing the judgment, is a species of influence which is more often exerted than acknowledged, the will remaining good as a whole. Where the will is not duly executed, e.g., if it is a forgery or if it is not signed by the testator or his executors, or if the testator is under any sort of duress, the will is void altogether. Where it contains devises or bequests bad in law, as in general restraint of marriage, or tending to create perpetuities, or contrary to public policy, or to some particular enactment, only the illegal part is void. A remarkable instance is a well-known case in which a condition subsequent in a devise was held void as against public policy, being a gift over of the estate devised in case the first devisee, personally to a certain value, having before his death obtained the lapsed title of duke of Bridgewater.1

There are some wills of an exceptional kind which demand special notice. The King.—It was resolved in parliament in Richard II's time that the Crown should not make wills. It was decided, as a rule, not to make their testaments. In some later cases parliamentary authority has been given to royal wills, in others not. The executors of Henry IV, were confirmed in their office by letters patent of Henry V, andthose of Henry VI, were confirmed in their office by letters patent. The daughter and heir of an English king were given to Henry VII, by an act of 1535-34, empowering him to limit and appoint the succession to the crown by his will. The will of the last sovereign, by will, bequeathed the whole of his estate to his wife. By 39 & 40 Geo. III. c. 88 the king and his successor may devise or bequeath their private property.2 No court, however, has jurisdiction to grant probate of the will of a king. Guardian.—As a general rule, wills deal with property, but even at common law a will simply appointing a guardian was good. The common law was superseded by an act of 1660, under which a father may dispose of the custody of his unmarried infant children by will. The will of the sovereign bequeaths to the crown the duties and powers in cases to the mother. Married Woman.—At common law a married woman could not (with a few exceptions) make a will without her husband's licence and consent, and this disability was specially preserved by the Wills Acts of Henry VIII. and of 1837. A common mode of avoiding this difficulty was for the husband to contract before marriage to permit the wife to make an appointment disposing of property by will. The right of a woman to make a will also in the case of marriage to the next of kin, does not extend to the next of kin to the husband by marriage and the birth of a child. Wills of soldiers on an expedition may be made by unattested writing or by non-testamentary testament before two witnesses. Wills of petty officers and seamen in the navy, and of marines, as far as relates to their pay or prize-money, must be attested by an officer, and wills made by a seaman in the merchant service must, if made at sea, be attested by the master or mate, if made on land by a super- intendent of a mercantile marine office, a minister of religion, justice, or officer of the navy. (1827) 5 & 6 Will. IV. c. 76. The Merchant Shipping Act 1845, ss. 177. The wills of prisoners of war are subject to special regulations, and the Admiralty may at its discretion waive

2 By § 1 of the act the word "will" includes codicil.
the due execution of wills in other instances. The effects of seamen, marines and soldiers, killed or dying in the service, are exempt from probate. Some provisions due to seamen employed in the navy may be paid out without probate where the whole assets do not exceed £32. The Board of Trade may at its discretion dispense with the probate of a will of a merchant seaman whose effects do not exceed £32. If the will is not presented within 12 months the Act requires that the whole of the effects shall vest in the native. The due execution of valid wills in the case of seamen is subject to the condition that the instruments shall be sealed. This does not apply to seamen who die abroad in the service of the Crown. Where the testator is a British subject, and where the property is left to the Crown, the property vests in the Crown.

Louisiana follows French law, by which the testator can provide for circumstances alienate by will more than half his property if he leave issue or descendants. In some states a married woman may not leave more than half her property away from her husband. Some require the husband's consent and subscription to make the will of a married woman valid. Unmarried and untestamentarily willed are in usu. The former are confined to personality and must generally be reduced to writing within a short time after the words are spoken. In Louisiana the mystic or sealed will still exists. There are several deviations of state courts that belief in spiritualism does not of itself constitute testamentary incapacity.

In Louisiana the mystic or sealed will still exists. There are several deviations of state courts that belief in spiritualism does not of itself constitute testamentary incapacity.

**France.**—The law is mainly contained in ss. 657-1074 of the Code Civil. Wills in France may be of three kinds: (1) holograph, which must be wholly written, dated and signed by the testator; (2) made as a public instrument, i.e. received by two witnesses before two witnesses or by one notary before four witnesses; this form of will must be dictated by the testator and written by the notary, but must be read over to the testator in the presence of the witnesses and must be signed by testator and witnesses; (3) mystic, which are signed by the testator, then closed and sealed and delivered by him to a notary before six witnesses; the notary then draws up an account of the property disposed of on the instrument which is signed by all notaries and witnesses. Legateses and their blood relations to the fourth degree may not be witnesses. Nuncupative wills are not recognized. Soldiers' and sailors' wills are subject to special rules as in most other countries. Full liberty of disposition only exists where the testator has no ascendants or descendants, in other cases his quantité disponible is subject to réserve; if the testator has one child he may only dispose of half his estate, if two only one-third, if three or more only one-fourth; if he has no descendants but ascendants in both lines he may dispose of half, if ascendants in one line only he may dispose of three-fourths. The full age of testamentary capacity is twenty-one years, but minors over the age of sixteen may dispose by will of half of the estate of which they could dispose had they been of full age. There is no restriction against married women making wills. A contract to dispose of the succession is invalid, s. 791.

The codes of the Latin races in Europe are in general accordance with the French law.

**Germany.**—Most of the law will be found in the Bürgehliches GesichtsG. ss. 266-273. A holograph will, either single-handed or witnessed, is lawful. The judge or notary (or outside Germany) a consul. Two witnesses are required, unless the witness be a notary or the registrar of the court, who is sufficient alone. The formalities may be relaxed in certain cases, such as imminent death, a state of siege, a prevailing epidemic, &c. Descendants, ascendants and the husband and wife, are entitled to compulsory portions (pflichtberechtigt). But those prima facie entitled may be deprived of their share for certain specified kinds of misconduct. A contract to make any specified testamentary disposition is operative. But a contract of inheritance (Erbevorsicht) may only be made by direct disposition is valid in certain cases and may operate on the death of the contractor. The modes of revocation are the same as in England (except marriage).

But there is one peculiar to Germany, the inconsistency of a will with an Erbrecht; in such an event the will is wholly or pro tanto revoked.

**International Law.**—There are three main directions which the opinion of jurists and the practice of courts have taken. (1) The property of the testator may be subjected to the law of his domicil. To this effect is the opinion of Savigny and the German practice. Certain modifications have been made by modern law, e.g. that the other events of 1896. (2) The property may be subjected to the law of the place where it happens to be at the
time of the testator’s death. (3) The movable property may be subject to the law of the domicil, the immovable (including leaseholds) to the law of the place where it is situate, the lex loci rei sitae. England and the United States follow this rule. Testamentary capacity is governed in the first instance by the law of the testator’s domicile at the time of his death, the form of the instrument in most countries either by the law of his domicil or the law of the place where the will was made, or by his testator’s domicile at the time of making it, or by the law of the place of his origin. Subsequent change of domicil does not affect the original law applicable. In Domicile Act 1864, enacted that by convention with any foreign government foreign domicil with regard to wills could not be acquired by domicil. It was carried on for the year and a written declaration of intention to become domiciled. By the same act foreign consuls may by convention have certain authority over the wills and property of subjects of foreign states dying in England. In the United States some states have adopted the narrow policy of enacting by statute the old common law rule, and providing that no will is valid unless made in the form required by the law of the state of the testator’s domicile. The capacity of the testator, revocation and construction of a will, are governed by the law of the domicil of the testator at the time of his death—except in cases affected by Lord Kingsdon’s Act, as he must be supposed to have used language in conscience with the law of his domicil. In England in 1874, the law was made to suit the case where the testator’s domicile was known to be in a place of the United Kingdom. A good instance is Groos’ Case (1904), Prob. 269, where it was held that the will of a Dutch woman (at the time of her death domicil in England) duly made in Holland was not revoked by her being domiciled in England at the time of revocation, or by the law of Holland.¹ The persons who are to take under a will are decided by different rules according as the property is movable or immovable, the former being governed by the law of the domicil, the latter by the law of Holland. It was held, however, in 1881 by the court of appeal in England that, under the will of an Englishman domicil in England, leaving personal property to children, children legitimated per subsequentum matrimoni could take, as they were legitimate by the law of Holland, though not by the law of England (re Goodman’s Trusts, 17 Ch. D. 266). This principle was carried further in re Grey’s Trusts (1882), 3 Ch. 88, where it was held that a testamentary device for conveying land not specifically subject to the laws of any particular country by the testator’s domicil was not valid, a testator’s domicil being in another country, of another country.

WILLEMITE, a mineral consisting of zinc orthosilicate, Zn₂SiO₄, crystallizing in the parallel-faced hemispherical class of the rhombohedral class. Crystals have the form of hemi-spherical prisms terminated by rhombohedral planes; there are distinct cleavages parallel to the prism-faces and to the base. Granular and cleavage masses are of more common occurrence. The colour varies considerably, being colourless, white, greenish-yellow, apple-green, flesh-red, &c. The hardness is 5½, and the specific gravity 3.9-4.2. A variety containing much manganeus replacing zinc is called “troostite.” Willemite occurs at Sterling Hill, Sussex county, and Franklin Furnace in New Jersey, where it is associated with other zinc ores (franklinite and azurite) as crystalline limestone. It has been found at only one other locality in the United States, and for this reason the mineral was named after William I. of the Netherlands. Under the influence of radium radiations, willemite fluoresces with a brilliant green colour.

WILLEM, FLORENT JOSEPH MARIE (1825-1905), Belgian painter, was born at Liége on the 8th of January 1825. He had no regular tuition in painting, but learnt by copying and restoring old pictures at Malines, where he lived from 1832. He made his debut at the Brussels Salon in 1842 with a “Music Party” and “An Interior of a 17th-century Guard-room” in the style of Terbrugghen and Rubens, and is well known for his landscapes, where his pictures enjoyed considerable popularity under the second empire. Among his most famous works may be mentioned “The Wedding Dress” (Brussels Gallery), “La Fête des grands-parents” (Brussels Gallery), “Le Baise-main” (Mme. Cardon’s collection, Brussels), “Farewell” (Willem’s coll., Brussels), “The Arches of the Peace” (Delahaye coll., Antwerp) and “The Widow” (engraved by Desvaches). He died at Neuilly-sur-Seine on the 23rd of October 1905.

WILLARD, FRANCES ELIZABETH (1830-1898), American reformer, was born at Churchville, Monroe county, New York, on the 28th of September 1830. She attended the Milwaukee Female College in 1837 and in 1839 graduated at the Northwestern Female College at Evanston, Illinois. She then became a teacher in the female schools of Evanston, Illinois, and in 1847-1849 was president of the Woman’s College at Evanston, which became part of the North-Western University in 1873. In 1874 she became corresponding secretary and from 1879 until her death was president of the National Woman’s Christian Temperance Union, and from 1887 until her death was president of the World’s Woman’s Christian Temperance Union. She first spoke in favour of woman’s suffrage in 1877; and in 1884 she was a member of the Executive Committee of the Prohibition party. In 1890 she was elected president of the Woman’s National Council of the National American Woman Suffrage Association. She was one of the founders of Our Union, a New York publication in the interests of the National Woman’s Christian Temperance Union, and of the Signal (after 1882 the Union Signal), which she edited in 1892-1898 and which was the Illinois organ of the union. She died in New York City on the 18th of February 1898.

With Mary A. Livermore she edited A Woman of the Century (Buffalo, N.Y., 1893), which includes a sketch of her life; and she published Unearthing Yesterday (1894), a life of Benjamin Franklin. Her famous books are: How to Win: A Book for Girls (1886), Glimpses of Fifty Years (1886), and, in collaboration with H. M. Winslow, Mrs S. J. White and others, Our Century (1897). She was a writer for A. Gordon, 2 A Life of Frances E. Willard (Chicago, 1898), with an introduction by Lady Henry Somerset, and W. M. Thayer, Women Who Win (New York, 1896).

¹ The law of Holland will be found set out in the case. It is in general accordance with that of France.
WILLETTE—WILLIAM I. (ENGLAND) 569

Lady of Willesden) was in the 11th century an object of pilgrimage, but by the middle of the century following the ceremonies had fallen into abuse, and the shrine was suppressed.

WILLETTE, LEON ADOLPHE (1857— ), French painter, illustrator, caricaturist, and lithographer, was born in Chalons-sur-Marne. He studied for four years at the Ecole des Beaux-Arts under Cabanel—a training which gave him a unique position among the graphic humorists of France. Whether comedy or tragedy, dainty triviality or political satire, his work is instinct with the profound sincerity of the artist. He set Pierrot upon a lofty pedestal among the imaginary heroes of France, and established a high place in the school of Paris. When he died, in 1902, the grief of his friends was hearted, in the affection of the nation. Willette is at once the modern Watteau of the pencil, and the exponent of sentiments that move the more emotional section of the public. Always a poet, and usually gay, fresh, and delicate, in his presentation of idylls exquisitely dainty and characteristically Gallic, illustrating the more "charming" side of love, often pure and sometimes unnecessarily materialistic, Willette frequently reveals himself bitter and fierce, even ferocious, in his hatreds, being a violent though at the same time a generous partizan of political ideas.

They met the same success with "Le Pincé" (1887), which is a satire on the Baudelaire-Verlaine rivalry for a female, whether they be ground down under the heel of political oppression, or are merely the victims of unrequited love, suffering all the pangs of grateful anguish that are born of scornful treatment. There is charm even in his thrilling apotheosis of the guillotine, and in the introduction into his caricatures of the figure of Death itself. The artist was a prolific contributor to the French illustrated press under the pseudonyms "Cémoi," "Pierrot," "Louison," "Bébé," and "Noo," but more often under his own name. He illustrated Méliandrin's Les Pierrots and Les Gboulités d’Avril, and has published his own Psaume Pierrot and other works, in which he tells his stories in scenes in the mode of Busch. He decorated several "brasseries artistiques" with wall-paintings, stained glass, &c., notably Le Chat noir and La Palette d’or, and he painted the highly imaginative ceiling for La Cigale music hall. His characteristically fantastic "Parce Domine" was shown in the Franco-British Exhibition in 1908. A remarkable collection of his works was exhibited in 1888.

His "Valmy" is in the Luxembourg, Paris.

WILLIAM (A.S. Wilhelm, O. Norse Viljæðr; O. H. Ger. Willhelm, Wilhel, Willhelm, M. H. Ger. Wilhel, Willhelm, Mod. Ger. Wilhelm, Wilhel, Mod. Fr. Guillaume, from "will," Goth. wijja, and "helm," Goth. hilms, Old Norse hildr, meaning "one who will to protect"), a masculine proper name borne by many European sovereigns and others, of whom the more important are treated below in the following order:—(1) kings of England and Scotland. (2) Other sovereigns in the alphabetical order of their states. (3) Other ruling princes. (4) Princes, Counters, &c.

WILLIAM I. (1027 or 1028-1087), king of England, surmounted the Conqueror, was born in 1027 or 1028. He was the bastard son of Robert the Devil, duke of Normandy, by Arlette, the daughter of a tanner at Falaise. In 1034 Robert resolved on a pilgrimage to Jerusalem. Having no legitimate son he induced the Norman barons to acknowledge William as his successor. They kept their engagement when Robert died on his journey (1035), though the young duke-elect was a mere boy. But the next twelve years was a period of the wildest anarchy. Three of William's guardians were murdered; and for some time he was kept in strict concealment by his relatives, who feared that he might experience the same fate. Trained in a hard school, he became a sworn enemy to the French government. He was but twenty years old when he stamped out, with the help of his overlord, Henry I of France, a serious rising in the districts of the Bessin and Cotentin, the object of which was to put in his place his kinsman, Guy of Brionne. Accompanied by King Henry, he met and overthrew the rebels at Val-des-Dunes near Caen (1047). It was by no means his last encounter with Norman traitors, but for the moment the victory gave him an assured position. Next year he joined Henry in attacking their common enemy, Geoffrey Martel, count of Anjou. Geoffrey occupied the border fortress of Alençon with the good will of the inhabitants. But the duke recovered the place after a severe siege, and inflicted a terrible vengeance on the defenders, who had taunted him with his base birth; he also captured the castle of Domfront from the Angevins (1049).

In 1051 the duke visited England, and probably received from his kinsman, Edward the Confessor, a promise of the English succession. Two years later he strengthened the claims which he had thus established by marrying Matilda, a daughter of Baldwin V. of Flanders, who traced her descent in the female line from Alfred the Great. This union took place in defiance of a prohibitory interdict, and was evidenced by the ceremony of burial only, and even then the cause for a much earlier death had been promulgated, in 1049, by the papal council of Reims. But the affinity of William and Matilda was so remote that political rather than moral considerations may have determined the pope's action. The marriage was zealously opposed by Archbishop Malger of Rouen and Lanfranc, the prior of Bec; but Lanfranc was persuaded to intercede with the Curia, and Pope Nicholas II. at length granted the needful dispensation (1059). By way of menace William and his wife founded the abbey of St Stephen and the Holy Trinity at Caen. The political difficulties caused by the marriage were more serious. Alarmed by the danger of a connexion between Flanders, the English and the house of Rollo. He joined forces with Geoffrey Martel in order to crush the duke, and Normandy was twice invaded by the allies. In each case William decided the campaign by a signal victory. The invasion of 1054 was checked by the battle of Mortemer; in 1058 the French rearguard was cut to pieces at Varaville on the Dive, in the act of crossing the stream. Between these two wars William aggrandized his power at the expense of Anjou by annexing Mayenne. Soon after the campaign of Varaville both Henry I. and Geoffrey Martel were removed from the throne by death (1066). He at once recovered Maine from the Angevins, nominally in the interest of Herbert II., the lawful count, who became his vassal. In 1062, however, Herbert died and Maine was formally annexed to Normandy. This acquisition brought the Norman frontier almost to the Loire and isolated Brittany, long coveted by the Norman dukes, from the rest of France.

About 1064 the accidental visit of Harold to the Norman court added another link to the chain of events by which William's fortunes were connected with England. Whatever doubt hangs over the details of the story, it seems clear that the earl made a promise to support the claims of his host upon the English succession. This promise he was invited to fulfil in 1066, after the Confessor's death and his own coronation. Harold's perjury formed the chief excuse for the Norman Conquest of England, which in reality was a piratical venture resembling that of the sons of Tancred d'Hauteville in Lower Italy. William had some difficulty in securing the help of his barons. When consulted in a great council at Lillebonne they returned an unfavourable reply, and it was necessary to convince them individually by threats and persuasions. Otherwise the conditions were favourable. William secured the benevolent neutrality of the emperor Henry IV.; the influence of the archdeacon Hildebrand obtained for the expedition the solemn approval of Pope Alexander II. Philip I. of France was a minor under the guardianship of William's father-in-law, the count of Flanders. With Tostig, the banished brother of Harold, William formed an alliance which proved of the utmost service. The duke and his Normans were enabled, by Tostig's invasion of northern England, to land unmolested at Pevensey on the 28th of September 1066. On the 14th of October a crushing defeat was inflicted on Harold at the battle of Senlac, or Hastings; and on Christmas Day William was crowned at Westminster.

Five years more were to elapse before he became master of the west and north. Early in 1067 he made a progress through parts of the south, receiving submissions, disposing of the lands of those who had fought against him, and ordering castles to be built; he then crossed the Channel to celebrate his triumph in Normandy. Disturbances at once occurred in Northumbria, on the Welsh marches and in Kent; and he was compelled to
return in December. The year 1068 was spent in military expeditions against Exeter and York, in both of which the adherents of Harold had found a welcome. In 1069 Robert of Conminges, a Norman to whom William had given the earldom of Northumberland, was murdered by the English at Durham; the north declared for Edgar Atheling, the last male representative of the West-Saxon dynasty; and Sweyn Estrithson of Denmark sent a fleet to aid the rebels. Joining forces, the Danes and English captured York, although it was defended by two Norman castles. The position seemed critical; but, fortunately for the king, the south and west gave no effective support to the rebellion. Marching rapidly on York he drove the Danes to their ships; and the city was then reduced by a blockade. The king ravaged the country as far north as Durham with such completeness that traces of devastation were still to be seen sixty years later. But the English leaders were treated with politic clemency, and the Danish leader, Jarl Ósbern, was bribed to withdraw his fleet. Early in 1070 the reduction of the north was completed by a march over the moors to Chester, which had not hitherto been submitted but was now placed under an earl of William's choice. From this point we hear no more of general rebellions against the foreign rule. In 1071 a local rising in the fens caused some trouble. An outlawed Englishman, Hereward by name, fortified the Isle of Ely and attracted a number of desperate spirits to his side; amongst others came Morcar, formerly earl of Northumbria, who had been disappointed in the hopes which he based on William's personal favour. The march of English and Danes, under the earl of Essex, which proved unexpectedly difficult. But the failure of the insurgents was a foregone conclusion.

Of the measures which William took to consolidate his authority we have many details; but the chronological order of his proceedings is obscure. The redistribution of land appears to have proceeded pari passu with the reduction of the country; and at every stage of the conquest each important follower received a new reward. Thus were formed the vast but straggling fleets which are recorded in Doomsday. The great earldoms of the West-Saxon period were allowed to lapse; the new earls, for the most part closely connected with William by the ties of blood or friendship, were lords of single shires; and only on the marches of the kingdom was the whole of the royal jurisdiction delegated to such feudatories. William's writs show not only that he kept intact the old system of governing through the sheriffs and the courts of shire and hundred, but also that he found it highly serviceable. Those whom he enfeoffed with land held it according to the law of Norman feudalism, which was already becoming precise. They were thus brought into close personal relations with the king. But he forced the most powerful of them to acknowledge the jurisdiction of the ancient local courts; and the old fyrd-system was maintained in order that the crown might not be wholly dependent on feudal levies. Though his forest-laws and his heavy taxation caused bitter complaints, William soon won the respect of his English subjects. They appear to have accepted him as the lawful heir of the Confessor; and they regarded him as their natural protector against feudal oppression. This is to be explained by his regard for legal forms, by his confidence in the law, by his liberality, and by the courtesy which he received from the church. Doomsday Book shows that in his confiscations he can have paid little attention to abstract justice. Almost every English landholder of importance was dispossessed, though only those who had actually borne arms against William should have been so treated. As far as possible Englishmen were excluded from all responsible positions both in church and state. After 1071 our accounts of William's doings become jeneune and disconnected. Much of his attention must have been engrossed by the work of administra-
tion, carried on without the help of those elaborate institu-
tions, judicial and financial, which were perfected by Henry I. and Henry II. William had few ministers of note. William Fitz Ósbern, earl of Hereford, who had been his right-hand man in Normandy, fell in the civil wars of Flanders (1071). Odo, bishop of Bayeux, William's half-brother, lost favour and was finally thrown into prison on a charge of disloyalty (1082). Another half-brother, Robert of Mortain, earl of Cornwall, showed little capacity. Of the king's sons Robert, though titular count of Maine, was kept in leading strings; and even William Rufus, who was in constant attendance on his father, never held a public office. The Conqueror reposed much confidence in two prelates, Lanfranc of Canterbury and Geoffrey of Coutances. They took an active part in the civil war, and were instrumental in the ecclesiastical government. But the king himself worked hard in hearing lawsuits, in holding councils and ceremonies courts, in travelling between England and Normandy, and finally in conducting military operations.

In 1072 he undertook a campaign against Malcolm, king of Scots, who had married Margaret, the sister of Edgar Atheling, and was inclined to promote English rebellions. When William reached the Forth his adversary submitted, did homage as a vassal, and consented to expel Edgar Atheling, who was subsequently endowed with an English estate and admitted to William's favour. From Scotland the king turned to Maine, which had profited by the troubles of 1069 to expel the Norman garrisons. Since then the Manceaux had fallen out among themselves. The barons supported Azo of Liguria, the lawful successor of Herbert II.; the citizens of Le Mans set up a commune, expelled Azo's representatives and made war on the barons. William had therefore no difficulty in reducing the country, even though Le Mans was assisted by Fulk of Anjou (1073). In 1075 the king's attention was claimed by a conspiracy of the earls of Hereford and Norfolk, in which the Englishman Walthof, earl of Northampton, was implicated to some degree. The rebels were defeated by Lanfranc in the king's absence; but William returned to settle the difficult question of their punishment, and to stamp out the last sparks of disaffection. The execution of Walthof, though strictly in accordance with the English law of treason, was a measure which he sanctioned after long hesitation, and probably from considerations of expediency rather than justice. This severity to a man who was generally thought innocent, is one of the dark stains on his career. In 1076 he invaded Brittany to get possession of the fugitive earl of Norfolk; but Philip of France came to the aid of the Bretons, and William gave way before his superior forces. The next few years were troubled by a quarrel between the king and his eldest son. Robert fled from Normandy and after aimless wanderings obtained from King Philip the castle of Gerberoi, in the Beauvaisis, from which he harassed the Norman marches. William besieged Gerberoi in 1079, and was wounded in single combat by his son. A little later they were reconciled; but the reconciliation was short-lived; to the end of the reign Robert was a source of trouble. In the year 1083 there was a second rising in Maine which was not laid to rest until William had granted liberal terms to the leader, Hubert of Beaumont. In 1085 news arrived that Cnut the Saint, king of Denmark, was preparing to assert the claims of his house in England. The project fell through, but gave occasion for the famous moot at Salisbury in which William took an oath of direct allegiance from "all the land-sitting men that were in England" (1086). While the danger was still impending he took in hand the compilation of the "laws of the Assizes," the work of the justices ordered at the Christmas Council of 1074 and carried out in the following year. It is probable that William never saw the Doomsday Book as we possess it, since he left England in the summer of 1086 and never returned. In 1087 he invaded the French Vexin to retaliate on the garrison of Mantes for raids committed on his territory. He sacked and burned the town. But as he rode out to view the ruins his horse plunged on the burning cinders and inflicted on him an internal injury. He was carried in great suffering to Rouen and there died on the 28th of September 1087. He was buried in St Stephen's at Caen. A plain slab still marks the place of his tomb, before the high altar; but his bones were scattered by the Huguenots in 1562.

In a profligate age William was distinguished by the purity of his married life, by temperate habits and by a sincere piety. His most severe measures were taken in cold blood, as part of
William II. (England)

his general policy; but his natural disposition was averse to unnecessary bloodshed or cruelty. His one act of wanton devastation, the clearing of the New Forest, has been grossly exaggerated. He was avaricious, but his church policy (see article ENGLISH HISTORY) shows a disinterestedness as rare as it is honourable. In personal appearance he was tall and corpulent, of a dignified presence and extremely powerful physique, with a bald forehead, close-cropped hair and short moustaches.

By Matilda, who died in Normandy on the 3rd of November 1083, William had four sons, Robert, duke of Normandy, Richard, who was killed whilst hunting, and the future kings, William II. and Henry I., and five daughters, including Adela, who married Stephen, count of Blois.

William II. (c. 1056-1100), king of England, surnamed Rufus, was the third son of William I. by his queen Matilda of Flanders. Rufus was born some years before the conquest of England, and the exact date is uncertain. He seems to have borne his father’s favour and was his heir apparent to the Conqueror’s company, although like his brothers he was carefully excluded from any share in the government either of England or Normandy. A squabble with Rufus was the immediate cause of Robert’s first rupture with the Conqueror; in the ensuing civil war we find Rufus bearing arms on the royal side (1077-1080). On this death-bed the Conqueror was inclined to disinherit his eldest son in favour of Rufus, who, by the early death of Prince Richard, was now left second in the order of succession. The king’s advisers, however, used their influence to obtain a promise that the throne should be occupied by the Conqueror’s son while Rufus was designated as the son on whom the Conqueror desired that the kingdom of England should devolve. With the help of Lanfranc the English were easily induced to accept this arrangement. Rufus was crowned at Westminster on the 26th of September 1087, fifteen days after the death of his father.

It may be in part the fault of our authorities that the reign of Rufus presents itself to us as a series of episodes between which the connexion is often of the slightest. In his domestic administration we can trace a certain continuity of purpose, and in his dealings with the Welsh and Scots he proceeded, though intermittently, along the broad lines of policy which his father had marked out. Beyond the Channel he busied himself with schemes, first for the reunion of England and Normandy, then for the aggrandisement of Normandy at the expense of France. But his attention was perpetually distracted by the exigencies of the moment. He threw himself into each particular design with unreflecting impetuosity, but never completed what had been well begun. The violence, the irregularity, the shamelessness of his private life are faithfully reflected in his public career. Every passing success increased his general policy could be justified, his methods of execution were cruelly conceived, brutal and shortsighted. Rufus may well stand as the typical product of early feudalism. He was not without valour or glimmerings of chivalry, but perfidious to his equals, oppressive to his subjects, contemptuous of religion; with no sense of his responsibilities, and possessed by a fixed determination to exact the last farthing of his rights. The first year of his reign was troubled by a general conspiracy among the baronage, who took up arms for Robert in the name of the hereditary principle, but with the secret design of substituting a weak and indolent for a ruthless and energetic sovereign. Local risings in Norfolk, Somerset and the Welsh marches were easily repressed by the king’s lieutenants. The castles of Kent and Sussex offered a more formidable resistance, since their lords were in direct communication with Robert of Normandy, and were led by the able Odo of Bayeux (q.v.), the king’s uncle, who had been released from prison at the opening of the reign. Rufus, however, made an earnest appeal to the native English, promising good laws, the abolition of unjust taxes and redress for those who had suffered by the afioresaments of the last king. The promise, which he never attempted to fulfil, served the purpose of the moment. Followed by large contingents of the national militia he successfully laid siege to the strongholds of the rebels. They were leniently treated, and the arch- conspirator, Odo of Bayeux, left England under a safe-conduct to sow fresh seeds of discord in Normandy. But Rufus resolved to take vengeance on his brother, and two years later invaded eastern Normandy. Encountering little resistance—for under Robert’s rule the duchy had relapsed into a state of anarchy—he might have expelled the duke with no great trouble. But in 1091 a treaty was hastily patched up. Rufus reiterated the claims of his son to the duchy of Normandy in certain seaports. In return he undertook to aid Robert in reducing the rebellious county of Maine, and in recovering the Cotentin from his younger brother, Henry Beaucler, to whom it had been pledged by the impiecunious duke. The last part of the agreement was duly executed. But Rufus then recrossed the Channel to chastise the Scots who in his absence had raided the north country. By a march to the Firth of Forth he vindicated English honour; Malcolm III. of Scotland prudently purchased his withdrawal, by doing homage (Aug. 1091) on the fulfillment of the terms which William I. had imposed in 1075. Next year Rufus broke the treaty by seizing the stronghold of Carlisle and the other lands held or claimed by Malcolm in Cumberland and Westmorland. Malcolm in vain demanded satisfaction; while attempting reprisals on Northumberland he was slain in an obscure skirmish (1093). Rufus immediately put forward a candidate for the vacant throne; and this policy, though at first unsuccessful, finally resulted in the accession of Edgar (1097), a son of Malcolm, who had acknowledged the English overlordship. Carlisle remained an English possession; in the next reign Cumberland and Westmorland appear as shires in the English census. The foreign policy of Rufus, though legally unjustifiable, was thus comparatively successful. In dealing with the Welsh he was less fortunate. Three campaigns which he conducted in North Wales, during 1095 and 1097, yielded no tangible result. The expansion of the Welsh marches in this reign was due to the enterprise of individual adventurers.

The affairs of Wales and Scotland did not prevent Rufus from resuming his designs on Normandy at the first opportunity. Robert was rash enough to repudiate his brother with non-fulfilment of the terms arranged in 1095; and Rufus seized the excuse for a second invasion of the duchy (1094). Less prosperous than the first, and interrupted by a baronial conspiracy, which kept Rufus in England for the whole of 1095, this enterprise found an unexpected termination. Robert resolved to go upon Crusade and, to obtain the necessary funds, gave Normandy in pledge to his brother (1096). There can be no doubt that Rufus intended to remain in lasting possession of this rich security. The interests of Normandy at once became the first consideration of his policy. In 1098-1099 he renewed the marches of the duchy, and also received commenced operations for the recovery of the Vexin. Early in 1100 he accepted a proposal, made by William IX. of Aquitaine, that he should take over that duchy on terms similar to those arranged in the case of Normandy. Contemporaries were startled at the rapid progress of the king’s ambitions, and saw the direct interposition of heaven in the fate which cut them short.

On the 2nd of August 1100 Rufus fell, in the New
WILLIAM III. (ENGLAND)

Forest, the victim of an arrow from an unknown hand. The common story names Walter Tirel, who was certainly close at hand and fled the country without venturing to abide the issue of a trial. But a certain Ralph of Aix is also accused; and Tirel, from a safe distance, solemnly protested his innocence.

It remains to notice the main features of the domestic administration which made the names of William and his minister, Ralph Flambard, infamous. Respecting the grievances of the laity we have few specific details. But we are told that the "moots" all over England were "driven" in the interests of the king; which perhaps means that aids were extorted from the shire-courts. It is also said that the tax which was levied, managed, and administered; that the king revived, for certain offences, the death-penalty which his father had abolished; that all men were vexed by unjust gelds and the feudal classes by unscrupulous misinterpretations of the customs relating to the incidents of wardship, marriage and relief. On one occasion the militia were summoned in considerable numbers for a Norman expedition, which was no part of their duty; but when they arrived at the sea-coast they were bidden to hand over their journey money and go home. The incident is not un instructive as a side-light on the king's finances. As to the expenditure of the revenues, we are fully informed; after allowing for exaggeration there still remains evidence enough to prove that the ecclesiastical policy of Rufus was unscrupulously venal. Vacant sees and abbeys were either kept for years in the hands of the king, who claimed the right of a feudal guardian to appropriate the revenues so long as the vacancy continued; or they were openly sold to the highest bidder. The history of Anselm's relations with the king is fully narrated by the biographer Eadmer. Anselm received the see of Canterbury in 1093, after it had been in the king's hands for upwards of four years. William made the appointment with a view of obtaining the hands of the king, who, who had accepted the primacy on the distinct condition that he should be allowed to acknowledge Urban. The dispute came before a great council which was held at Rockingham (Feb. 25, 1093). The king demanded that the assembly should adjudge Anselm guilty of contumacy, and was supported by the bishops. The lay barons, however, showed their ill-will towards the king's general policy by taking Anselm's part. Rufus was forced to give way. He recognized Urban, but entered upon intrigues at Rome to procure the suspension of the archbishop. Finding that Urban would not betray a loyal supporter, the king fell back upon his authority as a feudal suzerain. He taxed Anselm with having failed to provide a satisfactory quota of knights for the Welsh war (1097). The archbishop, seeing that he was never to be left in peace, and despairing of an opportunity to effect the reforms on which his heart was set, demanded urgently that he should be allowed to leave England for the purpose of visiting Urban. Both the king and the barons suspected that this was the first step towards an appeal to the pope's jurisdiction against that of the royal court. Leave was at first refused; but ultimately, as Anselm continued to press his demand, he was suffered to depart, not without experiencing some petty insults on his way (Oct. 1097). The motive of the king's apparent clemency was soon revealed. He seized the estates of the archbishopric, and kept them in his own hands for the future. The friends of the archbishop were thus justifiably in their assertion that the zeal of Rufus for his father's "customs" was a mere cloak for avarice and tyranny.

In appearance William II. was unattractive; bull-necked, with sloping shoulders, extremely corpulent and awkward in his gait. His long locks and clean-shaven face marked his predilection for the new-fangled fashions which contemporary ecclesiastics were never weary of denouncing. His features were strongly marked and coarse, his eyes grey and deeply set; he owed his nickname to the fiery hue of his complexion. He stuttered violently and in moments of passion was almost inarticulate. His familiar conversation was witty and blasphe- mous. He was also twitted by Anselm, the archbishop, who was then as noted for his learning, as the king for his folly, and no semblance of decorum was maintained in his household. His character was assailed by the darkest rumours which he never attempted to confute. He died unmarried and without issue.

WILLIAM III. (ENGLAND) 663

Franches Comité and other places in Spanish Flanders to France. For some reason never yet made clear, but perhaps in order to produce a modification of terms which threatened the balance of power, William attacked the French army at Mons four days after the signature of peace. Luxembourg defeated him after a sanguinary and resolute struggle, and William gained nothing by his inexplicable action.

After the war Louis continued a course of aggression, absorbing frontier-towns in imperial or Spanish territory. William started a new coalition against him in October 1661 by making a treaty with his daughter Mary to secure her marriage with his own son and heir, and the grand duke of Tuscany, and several German princes. After absorbing Strassburg (1681), Louis invaded Spanish Flanders and took Luxemburg (1684). Even then the new league would not fight and allowed Louis to retain his conquests by the truce of Regensburg (1685), but none the less these humiliations gave rise to a more closely-knit and aggressive coalition, which was organized in 1686 and known as the League of Augsburg.

From 1677 onwards William had carefully watched the policies of England. On the accession of James II. in 1685 he forced the duke of Orleans to leave Holland, and sought to disinherit him from his ill-starred expedition to England. He apparently tried to conciliate his father-in-law in the hope of bringing him into the League of Augsburg. At the same time he astutely avoided offending the party in England which was opposed to James. By November 1687 he had decided that it was hopeless to expect that James would join the league against Louis, and he therefore turned for support to the English opposition. He caused his chief minister Fagel to write a letter expressing his disapprobation of the religious policy of James, which was published in November 1687. This announcement of his views was received with wild enthusiasm by the English who saw in him the friend of their liberties and their Church. But he knew too much of the English to suppose they would tolerate an armed invasion, and he accordingly made it clear that he would not undertake active interference unless he received a definite invitation from leading Englishmen. On the 30th of June 1688 Admiral Herbert, disguised as a blue-jacket, set out from England with a letter from seven influential Englishmen, asking William to “bring over an army and secure the infringed liberties of England.”

William set out from Holland with an army on the 2nd of November and landed at Torbay (Nov. 5th 1688). After a few days of hesitation, many influential noblemen declared for him in different parts of the country. James, who had at first joined his army at Salisbury, fell back to London and tried to negotiate. While his commissioners were amusing William, James sent off his wife and son to France, and tried to follow them. He was stopped in his flight by some fishermen at Faversham, and was forced to return to London. William insisted that he should be sent to Rochester, and there allowed him to escape to France. After this final flight of James, William, on the advice of an assembly of notables, summoned a convention parliament on the 22nd of January 1689. After a great deal of discussion, William was at length proclaimed joint-sovereign of England in conjunction with his wife, Mary (Feb. 13th 1689).

A constitutional settlement was effected by the end of 1689, almost all the disputed points between king and parliament being settled in favour of the latter. Though William by no means appreciated this confinement of his prerogative, he was too wise to oppose it. His own initiative is more clearly traceable in the Toleration Act, extending liberty of private worship to Dissenters. He also succeeded in passing an Act of Grace and Indemnity in 1690, by which he calmed the violence of party passion. But in general his domestic policy was not very fortunate, and he can hardly claim any personal credit for the reassessment of the land-tax (1692), the creation of the national debt or the recoinage act (1693–1695). Further, he threatened the existence of the Bank of England, by lending his support to a counter-institution, the Land Bank, which ignominiously collapsed. Though he was not blind to the commercial interests of England, he was neglectful of the administration and affairs of her oversea colonies. But though he was unable to extract the best results from parliament he was always able to avert its worst excesses. In spite of strong personal opinions to the contrary, he accepted the Triennial Act (1694), the vote reducing the army to 10,000 men (1697), the vote disbanding his favourite Dutch Guards (1699) and even (November 1699) a bill recinding the grants of forfeited Irish estates, which he had made to his favourites. The main cause of the humiliations William suffered from parliament lay in his incapacity to understand the party or cabinet system. In his view the best way to govern was to govern himself, and he frequently went to the ministry, so that, as Whig and Tory fell out, the king came by his own hand to take the body of his reign shows that this method was unsuccessful, and that his affairs went most smoothly when the parliamentary majority held the same views as the ministry. It is not often remembered that William possessed an experience of the workings of representative government in Holland, which was remarkably similar to that in England. Hence his mistakes though easy to understand are by no means so pardonable as were, for example, those of the Georges, who had been absolute monarchs in their own country. William’s unpopularity with his new people was on the whole cured by his death, though it was partly darkened by the stain of the “Massacre of Glencoe.” In 1692 he signed an order for the “extirpation” of the Macdonalds, a small clan in the vale of Glencoe. It is improbable that he meant his order to be literally executed, it is not certain that he knew they had taken the oath of allegiance to him. None the less, when the massacre was carried out with circumstances of revolting barbarity, William behaved as he had done after the murder of De Witt. Popular pressure forced him to bring the murderers to justice, to punish them and dismiss them from service. But shortly afterwards they were all received into favour; “one became a colonel, another a knight, a third a peer.”

These and other actions indicate that William could show on occasion a cold and cynical ruthlessness. But while admitting that his means were sometimes unprincipled, it must be recollected that his real ends were high and noble. While he sometimes disregarded the wishes of others, no one was more ready to sacrifice his own feelings for the attainment of the master aim of his life, the restoration of the “Balance of Power,” by the overthrow of the predominance of France. This was the real aim of William in going to England in 1688. He had set off to secure an ally against Louis, and he came back from his expedition with a crown on his head and a new nation at his back, united in its detestation of popery and of France.

As king of England he concluded treaties of alliance with the members of the League of Augsburg and sent a large army to oppose the French in Flanders. But his greatest immediate peril during 1689-1690 came from the circumstance that the French disputed the mastery of the seas with the Anglo-Dutch fleet, and that Ireland was strongly for King James. On the 1st of July 1690 the allies were badly beaten at sea off Beachy Head, but on the same day William himself won a decisive victory over James’s army at the Boyne in Ireland. Dublin and Drogheda soon fell and James fled from Ireland. The chances of continued resistance in Ireland, which depended on communication with France, were finally destroyed by the great victory off Cape La Hogue (May 10th, 1692). Ireland was speedily conquered when once the supremacy of England on the sea became assured. Now the French fleet was definitely destroyed, and though a destruc- tive privatising warfare continued, England was no longer in danger of invasion.

The decisive successes for the Alliance were gained by its naval victories, whose importance William somewhat underrated and for whose execution he had only an indirect responsibility. In 1692 he lost Namur and was badly defeated at Steinkirk (August 4th), and in 1693 he was disastrously beaten at Neerwinden or Landen (July 19th). In 1693 he was able to resume the offensive and to retake Namur in a brilliant and what was more unusual, a successful campaign. William had assumed the duties of commander-in-chief too young to learn the full duties of a professional soldier himself, and his imperious will did not suffer.
others to direct him. Hence though often fertile in resource and ingenious in plan, he was always a brilliant amateur; and, though sometimes unlucky, he was never really the equal of such generals as Condé or Luxembourg.

In diplomacy William was as uniformly successful as in war he was the reverse. His unity of aim and constancy of purpose make him one of the greatest of modern diplomats. He held together his ill-assorted coalition, and finally concluded peace at Ryswick in September 1697. Louis restored all his acquisitions since 1678, except Strassburg, and recognized William as king of England. During the subsequent years William tried to arrange a partition treaty with France, by which the domains of the childless Charles II. of Spain were to be divided at his death. But on the death of Charles in 1700 the whole heritage was left to France. William endeavoured to oppose this, and used Louis's recognition of James Edward the "Old Pretender" as king of England (September 1701) to set the English people in a flame. War was already declared in 1702, but William, who had long been ailing, died from the combined effects of a fall from his horse and a chill on the 8th of March 1702. It was truly tragic that his doom should have come at the moment when he had once more drawn together a great alliance in Europe, and when he possessed a popularity in England such as he had never before enjoyed.

In viewing William's character as a whole one is struck by his entire absence of ostentation, a circumstance which reveals his mind and policy more clearly than would otherwise be the case. No one can doubt his real belief in religion in spite of many misunderstandings. His great favourites were a faithful wife and a fanatical wife, and often treated his wife with scant consideration; he was too fond of Dutch favourites like Keppel or worthless women like Lady Orkney. When it suited his interests he sanctioned the systematic corruption of members of parliament, and he condoned massacres like those at the Hague or in Glencoe. On the other hand he did not hesitate to inflict considerable injury on his own people, the Dutch, by the terms of the treaty with England (1689), when it became clear that only in this way could England's co-operation be secured. The Dutch criticism on him has been that he might have done more to reform the dummies of their constitutional procedure, and thus given them some return for the crippling expenses of the war. English criticism avers that he ought to have recognized more fully the system of party government, and to have done more to promote our colonial and commercial development. Military historians point out that he sometimes sacrificed great advantages to impetuosity; naval experts that he sometimes threw away great opportunities by indifference. Some of these criticisms are rather beside the mark, but were all true, they would not impair his essential greatness, but another - that a real powers of statemanship is that the peace of Utrecht was subsequently made on the broad lines which he had laid down as the only security for European peace nearly a dozen years before its conclusion. While he lacked in diplomacy the arts of a Louis XIV. or the graces of a Marlborough, he grasped the central problems of his time with more clearness, or advanced solutions with more ultimate success, than any other statesman of his age. Often baffled, but never despairing, William fought on to the end, and the ideas and the spirit of his policy continued to triumph long after the death of his author.

**WILLIAM IV. (ENGLAND)**

WILLIAM IV. (1765-1837), king of England, third son of George III., was born at Buckingham Palace on the 21st of August 1765. In 1779 he was sent to sea and became a midshipman under Admiral Digby. Next year he sailed under Rodney and took part in the action off Cape St Vincent (16th of January 1780). During the rest of the war the young prince saw plenty of service, for which he imbibed a strong liking, and so laid the foundation of his popularity. On the conclusion of the war he travelled in Germany, visiting Hanover and Berlin, where he was entertained by Frederick the Great. In 1788 he passed for lieutenant; next year he was made captain and stationed in the West Indies. Shortly after 1787, being tired of his station, he sailed home without orders, and was punished for his insubordination by being obliged to stay at Plymouth till his ship was refitted; when he again sailed for the West Indies.

In 1789 he was made duke of Clarence. When war was declared against the French republic in 1793, he strongly supported it and was anxious for active employment; but, though he was made rear-admiral of the red, he could obtain no command. Thus condemned to inactivity, he amused or revenged himself by joining the prince of Wales and the duke of York in their opposition to the king. He threw himself into the dissipation of society, and his hearty geniality and bluff, sailor-like manners gained him popularity, though they did not secure him respect. He took his seat in the House of Lords, where he defended the extravagancies of the prince of Wales, spoke on the Divorce Bill, vehemently opposed the emancipation of slaves and defended slavery on the ground of his experience in the West Indies. Meanwhile he formed a connection with Mrs Jordan, the actress, with whom he lived in terms of mutual affection and fidelity for nearly twenty years, and the union was only broken off eventually for political reasons. During all this period the prince had lived in comparative obscurity. The death of Princess Charlotte in 1817 brought him forward as in the line of succession to the crown. In 1818 he married Adelaide of Saxe-Meiningen, a lady half his age, without special attractions, but of a strong, self-willed nature, which enabled her subsequently to obtain great influence over her husband. On the death of the duke of York in 1827 the duke of Clarence became heir to the throne, and in the same year he was appointed lord high admiral. In discharging the functions of that office he endeavoured to assume independent control of naval affairs, although his patent precluded him from acting without the advice of two members of his council. This involved him in a quarrel with Sir George Cockburn, in which he had to give way. As he still continued to act in defiance of rules, the king was at length obliged to call upon him to resign.

On the 28th of June 1830 the death of George IV. placed him on the throne. The beginning of the first twenty years of his reign England underwent an agitation more violent than any from which it had suffered since 1688. William IV. was well-meaning and conscientious; but his timidity and irresolution drove ministers to despair, while his anxiety to avoid extremes and his want of insight into affairs prolonged a dangerous crisis and brought the country to the verge of revolution. Immediately after his accession the revolution of July broke out in France and gave a great impulse to the reform movement in England. The king, though he called himself an old Whig, did not dismiss the Tory ministry which had governed the country during the last two years of his brother's reign; but the elections for the new parliament placed them in a minority. Within a fortnight of the opening of parliament they were beaten on a motion for the reform of the civil list, and resigned. Lord Grey undertook to form a ministry, with the avowed intention of bringing in a large measure of reform. This was not in itself displeasing to the king, who had liberal tendencies, and a few years before had supported Catholic emancipation. But, when the struggle in parliament began, his disinclination to take up a decided attitude soon exposed the government to disaster. The first Reform Bill was introduced on the 1st of March 1831; the second reading was carried on the 21st of March by a majority of one. Shortly afterwards the government were beaten in committee.
and offered to resign. The king declined to accept their resignation, but at the same time was unwilling to dissolve, although it was obvious that in the existing parliament a ministry pledged to reform could not secern office. From this dilemma William was rescued by the conduct of the opposition, which, anxious to bring about a change of ministry, moved an address against dissolution. Regarding this as an attack on his prerogative, William at once dissolved parliament (April 1831). The elections gave the ministry an overwhelming majority. The second Reform Bill was brought in in June, and passed its third reading (21st of September) by a majority of 100. A fortnight later (8th of October) the Lords threw out the bill by a majority of 41. But after a protracted political crisis (see the article on Grey, CHARLES GREY, and Earl) the king was compelled to consent to create a sufficient number of new peers to carry the bill, and the threat was successful in bringing about the passing of the act in 1832.

During the rest of his reign William IV. had not much opportunity of active political interference, but on one other occasion he made an unjustifiable use of his prerogative. Two years after the passing of the Reform Bill the ministry of Lord Grey had become unpopular. In July 1834 Lord Grey himself retired and Lord Melbourne took the lead. There were divergences of opinion in the cabinet, and the king was anxious to secure a ministerial policy respecting the Irish Church. On the shallow pretext that Lord Althorp's removal to the Upper House would weaken the ministry in the House of Commons, where, however, they still had a majority, he suddenly dismissed them and summoned Sir Robert Peel (14th of November). Peel's ministry, containing many members who had been in the government on the king's accession, was called from its short duration "the ministry of the hundred days." Its formation clearly indicated that the Whig proclivities of the king, which had never been more than partial or lukewarm, had wholly disappeared. The step was regarded with general disapproval. It was immediately followed by a dissolution, and the ministry soon found themselves in a minority. Beaten on Lord John Russell's motion respecting the Irish Church (3rd of April 1835), Peel resigned and Melbourne again came into power. Under him the Whigs retained the lead during the remainder of the reign. This coup d'etat of November 1834 was the last occasion on which the English sovereign has attempted to impose an unpopular ministry on the majority in parliament.

In May 1837 the king began to show signs of debility, and died from a combination of the heart on the 20th of June, leaving behind him the memory of a genial, frank, warm-hearted man, but a blundering, though well-intentioned prince. He was succeeded by his niece Queen Victoria.

(W. G. P.)

WILLIAM (1113-1180), king of Scotland, surnamed the Lion, was the second son of Henry, earl of Huntingdon (d. 1153), a son of King David I., and became king of Scotland on the death of his brother, Malcolm IV., in December 1165, being crowned at Scone during the same month. After his accession to the throne William spent some time at the court of the English king, Henry II.; then, quarrelling with Henry, he arranged in 1168 the first definite treaty of alliance between France and Scotland, and with Louis VII. of France assisted Henry's sons in their revolt against their father in 1173. In return for this aid the younger Henry granted to William the earldom of Northumberland and other territories which the latter had lately sought from the English king, and which was possibly the cause of their first estrangement. However, when ravaging the country near Alnwick, William was taken prisoner in July 1174, and after a short captivity at Richmond was carried to Normandy, where he soon purchased his release by assenting in December 1174 to the treaty of Falaise. By this arrangement the king and his nobles, clerical and lay, undertook to do homage to Henry and his son; this and other provisions placing both the church and state of Scotland thoroughly under the suzerainty of England. William's next quarrel was with Pope Alexander III., the throwing out of a double choice for the vacant bishopric of St. Andrews. The king put forward his chaplain, Hugh; the pope supported the archdeacon, John the Scot, who had been canonically elected. The usual interchange of threats and defiances followed; then after the death of Alexander in 1181 his successor, Lucius III., consented to a compromise by which Hugh got the coveted bishopric and John became bishop of Dunkeld. In 1188 William secured a papal bull which declared that the Church of Scotland was directly subject only to the see of Rome, thus rejecting the claims to supremacy put forward in the English archbishop. This step was followed by the temporal independence of Scotland, which was one result of the continual poverty of Richard I. In December 1189, by the treaty of Canterbury, Richard gave up all claim to suzerainty over Scotland in return for 10,000 marks, the treaty of Falaise being thus definitely annulled.

In 1186 at Woodstock William married Ermengarde de Beaumont, a cousin of Henry II., and peace with England being assured three years later, he turned his arms against the turbulent chiefs in the outlying parts of his kingdom. His authority was recognized in Galloway which, hitherto, had been practically independent. He was also active in Scotland, and, as Lord Moray and Inverness; and a series of campaigns taught the far north, Caithness and Sutherland, to respect the power of the crown. The story of William's relations with King John is interesting, although the details are somewhat obscure. Soon after John's accession in 1199 the Scottish king asked for the earldom of Northumberland, which Richard I., like his father, had refused to restore to Scotland. John, too, refused this demand, but the threatened war did not take place, and in 1200 William did homage to the English king at Lincoln with the stipulation that he would remain in his own right. In 1202 a period of inaction between the two countries again became imminent in 1205; but a peace was made at Norham, and about three years later another amicable arrangement was reached. Both these treaties seem to have been more favourable to England than to Scotland, and it is possible that William acknowledged John as overlord of his kingdom. William died at Stirling on the 4th of December 1214 and was buried at Arbroath. He left one son, his successor Alexander II., and two daughters, Margaret and Isabella, who were sent to England after the treaty of 1200, and were both married English nobles, Margaret becoming the wife of the French king, and Isabella the wife of Walter de Bruce, Earl of Carrick, and later King of Scotland. William's reign is a very important period in the early history of Scotland, and may almost be said to mark an epoch in every department of public life. The relations of England and Scotland and of Scotland and France; the rise of towns, the development of trade and the establishment of order in Scotland itself; and the attitude of the Scottish Church, both to the papal see and to England, were all vitally affected by the events of this reign. William founded and richly endowed the abbey at Arbroth, and many of the Scottish towns owe their origin to his charters.

See E. W. Robertson, Scotland under her Early Kings (Edinburgh, 1862); Lord Hailes, Annals of Scotland (Edinburgh, 1819); A. Lang, History of Scotland, vol. i. (1900); also SCOTLAND: History.

WILLIAM I. (1179-1188), king of Prussia and German emperor, was the second son of Frederick William III. of Prussia and Louise, a princess of Mecklenburg-Strelitz. He was born at Berlin on the 22nd of March 1797, and received the names of Wilhelm Friedrich Ludwig. He was a delicate child and had to be carefully nurtured. His constitution, however, was sound, and he became one of the most vigorous men in Germany. After the battle of Jena his father, Frederick the Great, for a time fell into desperate circumstances. Meanwhile he had given evidence of sterling honesty, a strict love of order, and an almost passionate interest in everything relating to war. On the 1st of January 1807 he received an officer's patent, and on the 30th of October 1813 was appointed a captain. William accompanied his father in the campaign of 1814, and early in the following year received the iron cross for personal bravery shown at Bar-sur-Aube. He took part in the
entry into Paris on the 31st of March 1814, and afterwards visited London. He joined the Prussian army in the final campaign of the Napoleonic wars, and again entered Paris. The prince so was made a colonel and a member of the permanent military commission immediately after his twentieth birthday, and at the age of twenty-one became a major-general. In 1820 he received the command of a division; and during the following nine years he had not only made himself master of the military system of his own country but studied closely those of the other European states. In 1825 he was promoted to the rank of lieutenant-general, and obtained the command of the corps of guards. On the 11th of June 1829 he married Augusta, daughter of Charles Frederick, grand duke of Saxe-Weimar. This lady, who had imbibed the Liberal tendencies of the court of Weimar and later developed a keen sympathy with Catholicism, exercised afterwards as queen and empress a considerable influence at court, in a sense generally hostile to Bismarck's views. She died on the 7th of January 1890.

On the death of his father in 1840—the new king, Frederick William IV., being childless—Prince William, as heir presumptive to the throne, received the title of prince of Prussia. He was also made lieutenant-governor of Pomerania and appointed a general of infantry. In politics he was decidedly conservative; but at the outbreak of the revolutionary movement of 1848 he showed that some concessions to the popular demand for liberal forms of government were necessary. He urged, however, that order should be restored before the establishment of a constitutional system. At this time he was the best-hated man in Germany, the mass of the Prussian people believing him to be a vehement supporter of an absolutist and reactionary policy. He was even held responsible for the blood shed in Berlin on the 18th of March, and was nicknamed the "Cartidge Prince," although he had been relieved nine days before of his command of the guards. So bitter was the feeling against him that the king entrusted him with very few responsibilities for some months; he went to London, where he formed intimate personal relations with Prince Albert, Sir Robert Peel, Lord John Russell, Lord Palmerston and other English statesmen. On the 8th of June he was back at Berlin, and on the same day he took his seat as member for Wirsitz in the Prussian national assembly, and delivered a speech in which he expressed belief in constitutional principles. In 1849, when the revolutionary party in the grand-duchy of Baden became dangerous, he accepted the command of the "army of operation in Baden and the Palatinate," and his plans were so skilfully prepared and so successfully carried out that the course of a few days the rebellion was crushed. At the beginning of the campaign an unsuccessful attempt was made on his life. In October 1849 he was appointed military governor of the Rhineland and Westphalia, and took up his residence at Coblenz. In 1854 the prince was raised to the rank of a field-marshal and made governor of the federal fortress of Mainz. When the king was attacked with a disease of the brain, Prince William assumed the regency (7th October 1858), and on his brother's death, on the 2nd of January 1861, succeeded him as William I. The political events of William's regency and reign are told elsewhere (see Germany: History: Prussia: History). His personal influence upon these events is, however, of great importance and deserves separate notice. William was not a ruler of the intellectual type of Frederick the Great; but he believed intensely in the "God of battles" and in his own divine right as the viceroy of God so conceived. He believed also in the ultimate union of Germany and in the destiny of Prussia as its instrument; and he held that whoever aspired to rule Germany must seize it for himself (Letter to von Natzer of the 30th of May 1843, in Natzer's Unter den Hohenzollern). He opposed an attitude so wholly alien to the Liberal temper of contemporary Germany was tempered by shrewd common sense, and, above all, by a capacity to choose his advisers well and listen to their advice. Thus it came about that the regent, whose reactionary views were feared, called the Liberals into office on Bismarck's advice, though later he did not hesitate to override the constitution when the refusal of the supplies for the new armaments made this course necessary. From September 1862, when Bismarck took office as minister president, William's personality tends to be obscured by that of his masterful servant, who remained beside him till his death. But Bismarck's Reminis- cences contain plentiful proof that his master was by no means a cipher. His prejudices, indeed, were apt to run athwart the minister's plans; as in the Schleswig-Holstein question, when the king's conscience in the matter of the claims of the Augusten- burg prince threatened to wreck Bismarck's combinations. But, as Bismarck put it, the annexation of the duchies gave him "a taste for conquest," and in the campaign of 1866 the difficulty was to restrain the king, who wished to enter Vienna in triumph. Whatever may have been the feelings of the Prussians before the war, the striking success of Bismarck's policy, and on his return to Berlin he was received with unbounded enthusiasm.

In the events immediately preceding the Franco-German War of 1870-71 again it was Bismarck and not the king that gave the determining impulse. In the matter of the Hohenzollern candidacy King William's attitude was strictly "correct." He was justified in refusing to discuss further with Benedetti the question of "guarantees," a matter which touched his honour; and if the refusal, courteously framed, was read in Paris as an insult, this was due to Bismarck's "editing" of the Ems telegram (see page 467). The king, however, was not the person who initiated the French declaration of war that was all Germany rallied round the king of Prussia, and when, on the 31st of July, he quitted Berlin to join his army, he knew that he had the support of a united nation. He crossed the French frontier on the 11th of August, and personally commanded at the battles of Gravelotte and Sedan. It was during the siege of Paris, at his headquarters in Versailles, that he was proclaimed German emperor on the 18th of January 1871. On the 3rd of March 1871 he signed the preliminaries of peace which had been accepted by the French government. On the 19th of March, according to the constitution, he had opened the first imperial parliament of Germany. On the 16th of June he triumphantly entered Berlin at the head of his troops.

After that period the emperor left the destinies of Germany almost entirely in the hands of Bismarck, who held the office of imperial chancellor. In his personal history the most notable events were two attempts upon his life in 1875—one by a working lad called Hödel, another by an educated man, Karl Nobiling. On the first occasion the emperor escaped without injury, but on the second he was seriously wounded. These attempts grew out of the Socialist agitation and the execution for murder of the crown prince Frederick William (b. 1831), who succeeded him as Frederick III. (q.v.), and the princess Louise (b. 1838), married in 1856 to the grand-duke of Baden.

The reign of William I. marked an era of vast importance in the history of Germany. In his time Prussia became the first power in Germany and Germany the first power in Europe, though these momentous changes were due in a less degree to him than to Bismarck and Moltke; but to him belongs the credit of having recognized the genius of these men, and of having trusted them absolutely. Personally William maintained the best traditions of the Hohenzollerns, not only by the splendour of the achievements with which his name will always be intimately associated, but by the simplicity, manliness and uprightness of his daily life. By his marriage with Augusta of Saxe-Weimar William I. had two children: the crown prince Frederick William (b. 1831), who succeeded him as Frederick III. (q.v.), and the princess Louise (b. 1838), married in 1856 to the grand-duke of Baden.

William I.'s military writings were published in 2 vols. at Berlin in 1887. Of his letters and speeches several collections have appeared: Politische Korrespondenz Kaiser Wilhelms I. (1890); Kaiser Wilhelms des Grossen Briefwechsel und Selbsterzahlungen (ed. on behalf of the Kaiser of Bismarck (ed. Penzler, Leipzig, 1900). A large number of biographies have appeared in German, of which may be mentioned L. Schneider's Aus dem Leben Kaiser Wilhelms I. ( für die Jahre 1845-1850. Berlin, 1888. Fr. translation, 1888); v. Bernhardt, Die ersten Regierungsjahre K. Wilhelms. Tagebuchblätter (Leipzig, 1895); Oncken, Das Zeitalter Kaiser Wilhelms I. (2 vols., Berlin, 1890-1892); F. Delbrück, Die Jugend des Königs Friedrich Wilhelm IV. von Preussen und der Kaisers u. König Wilhelm I. Tagebuchblätter (Berlin, 1907); Blume, Kaiser Wilhelm und ... Roon als Bildner des preussisch-deutschen Heeres (Berlin, 1906); E. Marx, Kaiser...
WILLIAM II. (GERMANY)

**WILLIAM II.** [FRIEDRICH WILHELM VICTOR ALBERT] (1859— ), king of Prussia and German emperor, was born on the 27th of January 1859 at Berlin, being the eldest child of Prince Frederick of Prussia, afterwards crown prince and second German emperor, and of Victoria, princess royal of Great Britain, and Margaret, Duchess of Saxe-Coburg and Gotha. On his tenth birthday he was appointed second lieutenant in the First Regiment of the Guards. From September 1874 to January 1877 he attended the gymnasium at Cassel; he studied for two years at Bonn, and was then for some time chiefly occupied with his military duties. In 1883 he was appointed colonel of the Hussars of the Guard. He was much influenced by the military atmosphere in which his life was spent, and was more in sympathy with the strongly monarchical feelings of the emperor William and Bismarck than with the more liberal views of his own parents, but until the illness of his father in 1887 he took no part in political life. The death of his content to follow the secure and orderly received with the intimacies of his nature, which he was unwilling to yield to the ardent and restless spirit of the old time, with which the emperor had to contend in the year 1884. On November 11th of that year he became ninth king of Prussia and third German emperor. The chief events of his reign up to 1910 are narrated under GERMANY: History, but here it is necessary to dwell rather on the personality of the emperor himself. His first act was an address to the army and navy, while that to his people followed after three days. Throughout his reign, indeed, he repeatedly stated that the army was the true basis of his throne: “The soldier and the army, not parliamentary majorities, have welded together the German Empire.”

From the first he showed his intention to be his own chancellor, and it was this which brought about the quarrel with Bismarck, who could not endure to be less than all-powerful. The dismissal and disgrace of the great statesman first revealed the resolution of the new ruler; but, as regards foreign affairs, the apprehensions felt at his accession were not fulfilled. While he maintained and confirmed the alliance with Austria and Italy, in accordance to the last injunctions of his grandfather, he repeatedly attempted to establish more cordial relations with Russia, but his overtures, though warmly received by the government, were not so cordially returned. The intimacy of Russia was, from that time, increased, and more than a year passed before the Russian emperor appeared on a short visit to Berlin. In 1890 the emperor again went to Russia, and the last meeting between him and Alexander III. took place at Kiel in the autumn of 1891, but was marked by considerable coolness. By his visit to Copenhagen, as in his treatment of the duke of Cumberland and in his frequent overtures to France, the emperor showed the strong desire, by the exercise of his own great personal charm and ability, to heal the wounds left by the events of a generation before. In the autumn of 1885 he visited not only the courts of the confederate princes, but those of Austria and Italy. While at Rome he went to the Vatican and had a private conversation with Pope Leo XIII., and this visit was repeated in 1893 and again in 1903. In 1889 the marriage of his sister, the Princess Sophie, to the duke of Sparta, took him to Athens; and thence he sailed to Constantinople. It was the first time that one of the great rulers of Christendom had been the guest of the sultan. The more active interest was now taken by Germany in the affairs of the Levant, and the emperor showed that he would not be confounded, indeed, were it necessary to assert roads along which Bismarck had so long guided the country. It was not enough that Berlin had become the centre of the European system. The emperor was the apostle of a new Germany, which claimed that her voice should be heard in all political affairs, in whatever quarter of the globe they might rise. Once again, in 1898, he went to Constantinople. It was the time when the Armenian massacres had made the name of Abd-ul Hamid notorious, and the very striking friendliness shown towards him scarcely seemed consistent with the frequent claims made by the emperor to be the leader of Christendom; but any scruples were doubtless outweighed by the great impulse he was able to give to German influence in the East. From Constantinople he passed on to Palestine. He was present at the consecration of the German Protestant church of the Redeemer. By the favour of the sultan he was able to present to the German Catholics a plot of ground, the Dormition de la Sainte Vierge, very near to the Holy Places.

The motive of his frequent travels, which gained for him the nickname of *Der Reise-Kaiser*, was not solely political, but the love of his country. His love of the sea was shown in an annual voyage to Norway, and in repeated visits to the Cowes regatta. He was a keen yachtsman and fond of all sorts of sport, and, though deprived of the use of his left arm through an accident when he was a child, he became an excellent shot and rider.

At the time of his accession there was a strong manifestation of anti-British feeling in Berlin, and there seemed reason to suppose that the party from which it proceeded had the patronage of the emperor. Any temporary misunderstanding was removed, however, by his visit to England in 1889. For the next six years the relations of Germany to England were on the whole amicable. The emperor was prepared to understand the position of Great Britain, and during the period that Caprivi held office the political relations between Germany and Great Britain were very close. While the emperor’s visits were largely prompted by personal reasons, they had an important political effect; and in 1890, when he was entertained at the Mansion House in London and visited Lord Salisbury at Hatfield, the basis for an _entente cordiale_ seemed to be under discussion. But after 1895 the growth of the colonial spirit in Germany and the strong commercial rivalry with Great Britain, which was creating in Germany a feeling that a navy must be built adequate to protect German interests, made the situation regards England more difficult. And an unexpected incident occurred at the end of that year, which brought to a head all the latent feelings of suspicion and jealousy in both countries. On the occasion of the Jameson Raid he despatched to the president of the Transvaal a telegram, in which he congratulated him that “without appealing to the help of friendly powers,” he had succeeded in restoring peace and preserving the independence of his country. It was very difficult to regard this merely as an impulsive act of generous sympathy with a weak state unjustly attacked, and though warmly approved by Germany, it caused no less alarm from Great Britain. The emperor did not again visit England until the beginning of 1901, when he attended the deathbed and funeral of Queen Victoria. On this occasion he placed himself in strong opposition to the feelings of the large majority of his countrymen by conferring on Lord Roberts the Order of the Black Eagle, the most highly prized of Prussian decorations. He had already refused to receive the ex-president of the Transvaal on his visit to Europe. Meanwhile, with the other great branch of the English-speaking people in the United States, it was the emperor’s policy to cultivate more cordial relations. In 1902, on the occasion of the launching of a yacht built for him in America, he sent his brother Prince Henry to the United States as his representative. The occasion was rendered of international importance by his official attitude and by his gifts to the American people, which included a statue of Frederick the Great. The emperor also initiated in 1906 the exchange of professors between German and American universities.

As regards home policy, the most important work to which the emperor turned his attention was the increase of the German naval forces. From the moment of his accession he constantly showed the keenest interest in naval affairs, and the numerous changes made in the organization were due to his personal initiative. It was in January 1895, at an evening reception to members of the Reichstag, that he publicly put himself at the head of the movement for making Germany a sea power. In all the subsequent discussions on the naval bills his influence was decisively used to overcome the resistance of the Reichstag. “Our future,” he declared, “is on the water,” and in speeches in all parts of the country he combated the indifference of
the inland Germans to the sea. "I will not rest," he telegraphed to his brother, "till I have brought my navy to the same height at which my army stands." The development of German armaments during the next few years (see Navy) showed that this was no idle boast. But, while it was inevitable that the inference should be drawn that the increase of the German navy was directed towards eventual hostilities with Great Britain, the emperor himself insisted that the real object was the preservation of peace consistently with the maintenance of Germany's "place in the sun." In March 1905, in a speech at Bremen, he declared the aim of the Hohenzollerns to be "a world-wide dominion founded upon conquests not gained by the sword, but by the moral and political incensiveness of nations that press towards the same end." Every German warship launched, he said, "is one guarantee more for peace on earth." In the same spirit he protested later, in an "interview" published in the Daily Telegraph of the 28th of October 1906, that he had always been actuated by the friendliest feelings towards England, but that "Germany must be prepared for any eventualities in the East," and that, in view of the growing naval power of Japan, England should welcome the existence of a German fleet "when they speak together on the same side in the great debates of the future." In a letter to the emperor, who had published a cartoon, drawn by himself, representing him as the "Europeans" against the Yellow Peril, the Anglo-Japanese alliance seemed a betrayal of the white race, an unnatural league which could not last. The justification of his naval policy so far as European affairs were concerned was revealed in the effective intervention of Germany in regard to France and Morocco in 1905, and in 1909 in the defence of British policy when Austria, backed by Germany, tore up the treaty of Berlin in regard to Bosnia and Herzegovina.

In numerous rhetorical speeches the emperor had impressed the world with his personal conviction of autocratic sovereignty, and his monarchical activity was certain, sooner or later, to bring him into conflict with the constitutional limitations of his position as king of Prussia and German emperor. His imperial style, constitutionally but the honorary title of the primus inter pares in a free confederation of sovereign princes, was invested in him by something of the glamour of that of the Holy Roman emperors, with their shadowy claim to world-dominion. In speech after speech he proclaimed the world-mission of Germany, of which he himself was the divinely appointed instrument; Germany, he said, was "the river of the eternal life, which flows in the work of civilization," and Germanism, like the spirit of imperial Rome, must expand and impose itself. This new imperialism, too, had a religious basis, for "the whole of human life hinges simply and solely on our attitude towards our Lord and Saviour." The emperor's progress in the East were conceived in the spirit of the new crusade, at once Christian and German; and a solemn service, to which none but the emperor and his train were admitted, was held on the summit of the Mount of Olives. In the same spirit, too, the emperor dispensed the marks of his approval and disapprobation beyond the borders of his own jurisdiction, sometimes with results which were open to criticism. The "Kruger telegram" has been mentioned; scarcely less characteristic was the message despatched by him on the 9th of April 1906, after the Algiers conference, to Count Goluchowski, the Austro-Hungarian foreign minister, congratulating him on having proved "a brilliant second on the dwelling-ground." Goluchowski's retirement was mainly due to this compliment. In 1905 he bestowed the order Pour le Mérite not only on the Japanese general Sogi, but also on the Russian general von Stössel, the defender of Port Arthur, who was afterwards condemned by a Russian court-martial for dereliction of duty. In 1902 his telegram to the regent of Bavaria condemning the refusal of the clerical majority in the diet to vote £5000 for art purposes, and offering himself to supply the money, was regarded as an unwarrantable interference in the internal affairs of Bavaria and roused strong resentment among the clericals all over Germany.

Owing to the political conditions in Germany, it was generally left for the Socialists to attack these excursions on the part of the emperor into fields which lay beyond his strict prerogative. But, apart from the traditional lines of political cleavage, such as the inherited hatred of the Liberal South for the Hohenzollern "corporate's cane," other centres of dissatisfaction were coming into being. The emperor was isolated in his efforts to impose the old, strenuous, Prussian ideals of "self-denial, discipline, religion, avoidance of foreign contagion." With the growth of wealth Germany was becoming materialized and to some extent Americanized, partly through the actual reflux of emigrants grown rich in the United States. In this mood, far removed from the days, denounced by the historian Gervinus, when the Germans were content to "fiddle and be slaves," the phrases which still woke responsive echoes in the cusses of the Old Mark of Brandenburg were apt to create surprise, if not indignation; and in the great industrial classes the principles of Social Democracy spread apace. The emperor himself here and there even yielded a little to the new ideas, as when, in the famous "Babel and Bible" controversy of 1903, arising out of lectures in which Professor Delitzsch had derived Jewish monotheism from Babylonian polytheism, he publicly accepted the main conclusion of the "higher criticism" of the Old Testament, while maintaining that the kernel and contents, God and His works, remain always the same; or when on the 17th of November 1906, on the 25th anniversary of William I's edict announcing national insurance, he promised further social reforms. But he was impatient of what he considered factious opposition, and was apt to appeal from the nation in parliament to the nation in arms, as when in 1906, at the Silesian manoeuvres, he condemned the critical spirit exercised towards the government, and invoked once more the protection of Germany's "Divine Ally." Clearly, this was an attitude which was inconsistent with the development of what prided itself on being a constitutional state; but there were obvious difficulties in the way of controlling the utterances of a ruler, vigorous, self-confident and conscious of the best intentions, who was also the master of many legions, whose military spirit he could evoke at will. In October 1906 the publication of Prince Hohenlohe's Memoirs, containing indirect revelations of the emperor's action in the dismissal of Bismarck, caused a profound sensation. A further injury to the emperor was the fall of Caprivi in 1894. The long-drawn-out trials and counter-trials left the character of the emperor entirely unattested, but they resulted in the disgrace of men who had been his confidants—Prince Philip Eulenburg, Count Kuno Moltke and others. The attitude of the emperor throughout was manly and sensible; and not the least satisfactory outcome of the whole sorry business was the issue, on the 28th of January 1907, of an edict, afterwards embodied in a bill, greatly modifying the law of lese-majeste, which in the earlier part of the reign had been used to ridiculous excess in the imprisonment of the authors of the slightest reflection on the person of the sovereign.

 Anglo-German relations were apparently improved by a visit of the emperor to England in November 1907. But early in 1908 they were again strained by the revelation, made in The Times of the 6th of March, of a correspondence between the emperor and Lord Salisbury in 1898, in which the former, in answer to friendly assurances on the emperor's part, the British secretary of state had communicated to him an outline of the new naval programme before it had even been laid on the table of the House of Commons. The angry controversy to which this gave rise, and the emperor's attempts to allay it, led at the end of the year to a serious crisis in his relations with his subjects. On the 11th of August he had met Edward VII. at Cronberg; on the 30th, in a speech at Strassburg, he reiterated
the intention of Germany to maintain the high level of her armaments; and on the 28th of October there appeared in the Daily Telegraph an extraordinary "interview," authorized by him, in which he expounded his attitude. The document was a résumé of his table-talk during his stay at Highcliffe Castle, on the Hampshire coast opposite the Isle of Wight, in the autumn of 1907. In it he reiterated that his heart was set on peace; he declared that, so far from being hostile to the English, he had offended large sections of his people by his friendship for England. He instanced his refusal to receive the Boer delegates and his rejection of their proposals (the two columns are in pencil) as the best of all the ways to stop the South African War; he also mentioned the curious fact that at an early stage of the war he had himself drawn up a plan of campaign for the British and sent it to Windsor. It was on this occasion, too, that he made the suggestion of an eventual co-operation of the British and German fleets in the Far East. This pronouncement created a profound sensation, not only in Germany, where the indignation was intense, but in Russia, France and Japan, where it was regarded as a Machiavellian attempt to loosen existing alliances. In the German press and parliament a storm of protest arose. Prinz Bülow only received recognition, which was not accepted, and he was forced to make in the Reichstag the best defence that he could for the imperial indiscretion, declaring that henceforward the emperor would show more reserve. The emperor publicly endorsed the chancellor's explanations, and for nearly two years maintained in public an almost unbroken silence. But this came to an end in a speech delivered at Königsberg, on the 25th of August 1910. In this the emperor again laid special stress upon the divine right by which alone the kings of Prussia rule, adding: "considering myself as the instrument of the Lord, without heeding the views and opinions of the day, I go my way." This speech led to a debate, on a Socialist interpellation, in the Reichstag (November 26). In reply to the enquiry what the government intended to do in fulfilment of the pledge given in 1908, the chancellor denied that the emperor had exceeded his constitutional rights, a view supported by the majority of the House.

The emperor married on the 27th of February 1881 Princess Augusta Victoria, daughter of Frederick, duke of Augustenborg, who in 1864 had come forward as claimant to the duchy of Schleswig-Holstein; the marriage had, therefore, some political importance, for it sealed the reconciliation of one of the dynasties that had suffered by the rise of Prussia. Those of the family of William II., born 6th May 1852, Crown Prince, whose coming of age was celebrated with much ceremony on his eighteenth birthday, and who married on the 6th of June 1905 the duchess Cecilia of Mecklenburg-Strelitz, then princess, were: (1) Wilhelm, born 27th July 1892; (2) Eitel Friedrich, born on the 7th of July 1885; (3) Adalbert, born on the 14th of July 1883; (4) August Wilhelm, born on the 27th of July 1888; (5) Joachim, born on the 17th of December 1896; and (6) Viktoria Luise, born on the 13th of September 1892.

For the emperor's speeches, see Kaisersreden, Reden und Erklärungen, Briefe und Telegramme Kaiser Wilhelms II. (Leipzig, 1902; translated by L. Elkind, as The German Emperor's Speeches (London, 1904).

William I. (1772-1844), king of the Netherlands, born at the Hague on the 24th of August 1772, was the son of William V., prince of Orange and hereditary stadtholder of the United Netherlands by Sophia Wilhelmina, princess of Prussia. In 1791 he married Frederica Wilhelmina, daughter of Frederick William II., king of Prussia, thus cementing very closely the relations between the houses of Orange-Nassau and Hohenzollern. After the outbreak of the revolt in 1793, he distinguished himself in the struggle against the revolutionary army under Dumouriez by the capture of Landrecies and the relief of Charleroi. By the victories of Pichegru the stadtholder and all his family were, however, compelled to leave Holland and seek refuge in England, where the palace of Hampton Court was set apart for their use. He afterwards made Berlin his residence, and took an active part in the unfortunate campaign under the duke of York for the reconquest of the Netherlands. After the peace of Amiens he had an interview with Napoleon at Paris, and received some territory adjoining the hereditary domains of the house of Nassau in Westphalia as a compensation for the abandonment of the stadtholderate and the domains of his house.

William refused, however, in 1806, in which year by the death of his father he became prince of Orange, to separate his interests from those of his Prussian relatives, and fought bravely at Jena. He was therefore despoiled by Napoleon of all his possessions. In 1809 he accepted a command in the Austrian army under the archduke Charles and was wounded at the battle of Wagram. When Holland rose in revolt against French domination in 1813, after eighteen years of exile he landed at Scheveningen (on the night of July 28th), and was the central figure in the reversal rejoicing, proclaimed prince sovereign of the Netherlands. His assumption in the following year of the title of king of the Netherlands was recognized by the powers, and by the treaty of Paris his sovereignty was extended over the southern as well as the northern Netherlands, Belgium being added to Holland as an increase of territory." After the battle of Waterloo, in which Dutch and Belgian troops fought side by side under his command, the congress of Vienna further aggrandized him by making him sovereign of the territory of Luxemburg with the title of grand duke.

William had many excellent qualities, but his long life of exile and hardship had made him niggardly and narrow. He was unable to rise to the great opportunity which lay before him of creating out of the Dutch and Belgian provinces a strong and united state. Two hundred and fifty years of political separation and widely differing experiences had caused the two kindred populations on this and that side of the Scheldt to grow apart in sentiment and tradition. This difference was still further accentuated by strong divergence in religious creed. Further, one-third of the Belgian provinces was inhabited by a Walloon population divided from the Flemings by racial characteristics and their use of a Romance instead of a Teutonic dialect. All these things William was inclined to ignore. He drew up a constitution, which was accepted unanimously by the Dutch, but was rejected by the Belgians, because it contained provisions for liberty of worship. The king, however, by a subterfuge declared that the fundamental law had been approved. The new constitution, therefore, started badly, and it was soon evident that William intended to make his will prevail, and to carry out his projects for what he conceived the social, industrial and economic welfare of his country. His royal prerogative and the opposition of Belgian public opinion. The Belgians had many grievances. Their representation in the states general was exactly equal to that of the Dutch, though their population was in the proportion of seven to five. With the help of the official vote of ministers the Dutch were thus able to have a perpetual majority. The whole machinery of government was centralized at the Hague, and Dutchmen filled nearly all the principal posts. The attempt of the king to enforce the official use of the Dutch language, and the foundation of the so-called philosophical college at Louvain helped to exacerbate the growing discontent. The rapid advance of Belgium in industrial and manufacturing prosperity, due largely to the stimulus of William's personal initiative, did nothing to bring north and south together, but rather increased their rivalry and jealousy, for the Dutch provinces had neither manufactures nor iron- and coal-mines, but were dependent on agriculture and sea-borne commerce for their welfare. Such clashing of interests was sure to produce alienation, but the king remained apparently blind to the signs of the times, and the severe enforcement of a harsh law restricting freedom of the press led suddenly in 1830 to a revolt (see Belgium), which, beginning at Brussels at the end of August, rapidly spread over the whole country. The Dutch were almost without striking a blow expelled from the country, the strongly fortified seaport of Antwerp alone remaining in their hands. Had the king consented at once to the administrative autonomy of Belgium, and appointed the prince of Orange governor of the southern Netherlands, it is probable that the revolt might have been appeased. At the first there was undoubtedly a strong body of public opinion in favour of such a compromise, and the house of Orange had many adherents in the country. William,
however, was too proud and too obstinate to lend himself to such a course. He appealed to the powers, who had, in 1815, created and guaranteed the independence of the kingdom of the Netherlands. By the treaty of the eighteen articles, however, concluded at London on the 20th of June 1831, the kingdom of Belgium was recognized, and Leopold of Saxe-Coburg was elected king. William refused his assent, and in August suddenly invaded Belgium. The Belgian forces were dispersed, and the Dutch would have entered Brussels in triumph but for the intervention of the French. Still, however, William declined to recognize the result as a constitution, and he had behind him the unanimous support of Dutch public opinion. For nine years he maintained this attitude, and resolutely refused to append his signature to the treaty of 1831. His subjects at length grew weary of the heavy expense of maintaining a large military force on the Belgian frontier and in 1839 the king gave way. He did so, however, on favourable terms and was able to insist on the Belgians yielding up their possession of portions of Limburg and Luxemburg, which they had occupied since 1830.

A cry now arose in Holland for the revision of the fundamental laws of the country for more liberal institutions; ministerial responsibility was introduced, and the royal control over finance diminished. William, however, disliked these changes, and finding further that his proposed marriage with the countess of Oultremont, a Belgian and a Roman Catholic, was very unpopular, he suddenly abdicated on the 7th of October 1840. After his abdication he married the countess and spent the rest of his life in quiet retirement upon his private estate in Stiles. He died in 1844.

See L. Jotte, Guillaume d’Orange avant son abdication au trône hollandais (Rotterdam, 1833; and in the Couronne du royaume des Pays-Bas depuis 1789 jusqu’en 1830 (5 vols., Brussels, 1842); W. WILLIAM II. (1762–1839), king of the Netherlands, son of William I., was born at the Hague on the 6th of December 1762. When he was three years old his family was driven out of Holland by the French republican armies, and lived in exile until 1813. He was educated at the military school at Berlin and afterwards at the university of Oxford. He entered the English army, and in 1811, as aide-de-camp to the duke of Wellington, took part in several campaigns of the Peninsula War. In 1815 he commanded the Dutch and Belgian contingent, and won high commendations for his courage and conduct at the battles of Quatre Bras and Waterloo, at the latter of which he was wounded. The prince of Orange married in 1816 the grand duchess Anna Paulowna, sister of the tsar Alexander I. He enjoyed considerable popularity in Belgium, as well as in Holland for his affability and moderation, and in 1830, on the outbreak of the Belgian revolution, he betook himself to Brussels, and did his utmost by personal conferences with the most influential men in the Belgian capital to bring about a peaceable settlement on the basis of the administrative autonomy of the southern provinces under the house of Orange. His father had given him powers to treat, but afterwards threw him over and rejected the terms of accommodation that he had proposed. He withdrew this to England and resided there for several months. In April 1831 William took the command of a Dutch army for the invasion of Belgium, and in a ten-days’ campaign defeated and dispersed the Belgian forces under Leopold I. After a sharp fight near Louvain. He would have entered Brussels in triumph, but his victorious advance was stayed by the intervention of the French. In 1830, on the abdication of his father, he ascended the throne as William II. The peace of 1830 had settled all differences between Holland and Belgium, and the new king found himself confronted with the task of the reorganization of the finances, and the necessity of meeting the popular demand for a revision of the fundamental law, and the establishment of the electoral franchise on a wider basis. He acted with good sense and moderation, and, although by no means a believer in democratic ideas, he saw the necessity of satisfying public opinion and frankly gave his support to larger measures of reform. The fundamental law was altered in 1848 and the Dutch monarchy, from being autocratic, became henceforth constitutional. The king’s attitude secured for him the good will and affection of a people, loyal by tradition to the house of Orange, and the revolutionary disturbances of 1848 found no echo in Holland. William died suddenly on the 17th of March 1849.

(G. E.)

WILLIAM III. (1817–1890), king of the Netherlands, son of William II., was born at Brussels on the 10th of February 1817. He married in 1839 Sophia, daughter of William I., king of the Netherlands. Sophia was an accomplished woman of high intelligence, but unfortunately the relations between the royal pair were far from cordial and finally ended in complete disagreement, and the breach between them continued until the death of the queen in 1877. The private life of the king in fact gave rise to much scandal; nevertheless he was an excellent constitutional monarch, and, though he never sought to win popular favour, succeeded in winning and retaining in a remarkable degree his people’s affectionate loyalty. He had no sympathy with political liberalism, but throughout his long reign of forty-two years, with a constant intermixture of ministries and many ministerial crises, he never had a serious conflict with the states-general, and his ministers could always count upon his fair-mindedness and an earnest desire to help them to further the national welfare. He was economical, and gave up a third of his civil list in order to help forward the task of establishing an equilibrium in the annual budget, and he was always ready from his large private fortune to help forward all schemes for the social or industrial progress of the country. It was largely due to his prudent diplomacy that Holland passed pacifically through the difficult period of the Luxemburg settlement in 1866 and the Franco-German War of 1870.

William III. had two sons by his marriage with Sophia of Württemberg, William (1841–1879), and Alexander (1843–1884). Both of them died unmarried. The decease of Prince Alexander left the house of Orange without a direct heir male, but the prospect of a disputed succession had fortunately been averted by the marriage of the king in 1879 with the princess Emma of Waldeck-Pyrmont. From this union a daughter, Wilhelmina, was born in 1882. On her father’s death at the Loo, on the 23rd of November, 1890, she ascended the throne as queen of the Netherlands under the regency of her mother.

William was grand duke of Luxemburg by a personal title, and his death severed the dynastic relation between the kingdom of the Netherlands and the grand duchy. The sovereignty of the Luxemburg duchy passed to the next heir male of the house of Nassau, Adolphus, ex-duke of Nassau.

See J. A. Brujinse, Geschiedenis van Nederland in ouwen tijd (5 vols., Schiedam, 1889–1906); P. Blok, Geschiedenis der Nederlandse Volk (Leiden, 1906), vol. viii.; and G. L. Keppeler, De regerings van Koning Willem III. (Groningen, 1887).

WILLIAM (1227–1256), king of the Romans and count of Holland, was the son of Count Floris IV. and his wife Matilda, daughter of Henry, duke of Brabant. He was about six years of age when his father was killed in a tournament, and the fact that his long minority was peaceful and uneventful speaks well for the good government of his two paternal uncles, who were his guardians. William was, however, suddenly in 1247 to become a prominent figure in the great Guelp-Ghibelline struggle, which at that time was disturbing the peace of Europe. The quarrel between the church and the emperor Frederick II. had now reached an acute stage. Pope Innocent IV., who had failed in repeated efforts to induce various princes to accept the dignity of king of the Romans in place of the excommunicated Frederick, found the youthful William of Holland ready to accept the proffered crown. After a long siege William succeeded in taking the imperial city of Zwickau, where he was crowned on All Saints’ Day 1248. As the recognized head of the Guelp party he spared no efforts to win for himself friends
in Germany, but he never really succeeded in forming a party or gaining for himself a footing in the Empire during the lifetime of Frederick. With the extinction of the Hohenstaufen house in 1254 his chances were much improved, but shortly afterwards his death occurred on the 28th of January 1256 through his horse breaking through the ice during an obscure campaign among the Friesian marshes. William was more successful in his struggles with Margaret, countess of Flanders and Hainaut, known as "Black Meg." She wished her succession to pass to the sons of her second marriage with William of Dampierre in preference to those of his first marriage with Bouchard of Avennes. But John of Avennes, her eldest son, had married William's sister Aleidis. William took up arms in defence of his brother-in-law's rights and Margaret was decisively beaten at West Kappel in 1253, and was compelled to acknowledge John of Avennes as her successor to the county of Hainaut.

See A. Ulrich, Geschichte des römischen Königs, Wilhelm von Holland (Hanover, 1882).

WILLIAM I. (d. 1166), king of Sicily, son of King Roger II. by Elvira of Castile, succeeded in 1154. His title "the Bad" seems little merited and expresses the bias of the historian Falcandus and the baronial class against the king and the official class by whom he was guiled. It is obvious, however, that William was far inferior in character and energy to his father, and that his rule was more of a despotism than of a constitutional monarchy. The real power in the kingdom was at first exercised by Maio of Bari, a man of low birth, whose title *ammiratorum* was the highest in the realm. Maio continued Roger's policy of excluding the nobles from the administration, and sought also to curtail the liberties of the towns. The barons, always chafing against the royal power, were encouraged to revolt by Pope Adrian IV., whose recognition William had not yet sought, by the Basileus Manuel and the emperor Frederick II.

At the end of 1155 Greek troops recovered Bari and began to besiege Brindisi. William, however, was not devoid of military energy; landing in Italy he destroyed the Greek fleet and army at Brindisi (28th May 1156) and recovered Bari. Adrian came to terms at Benevento (15th June 1156), abandoned the rebels and confirmed William as king, and in 1158 peace was made with the Greeks. These diplomatic successes were probably due to Maio; on the other hand, the African dominions were lost to the Almohads (1166-1167), and it is possible that he advised their abandonment in face of the dangers threatening the kingdom down from the north. The policy of the minister led to a general conspiracy, and in November 1160 he was murdered in Palermo by his chief bodyguard, a leader of the armed forces, who had been made a knight by islanders. It is surmised that he was in the hands of the conspirators, who purposed murdering or deposing him, but the people and the army rallied round him; he recovered power, crushed the Sicilian rebels, had Bonello blinded, and in a short campaign reduced the rest of the Regno. Thus freed from feudal revolts, William confirmed the government to men trained in Maio's school, such as the grand notary, Matthew d'Agelo. His latter years were peaceful; he was now the champion of the true pope against the emperor, and Alexander III. was installed in the Lateran in November 1165 by a guard of Normans. William died on the 7th of May 1166.

WILLIAM II. (d. 1189), king of Sicily, was only thirteen years old at the death of his father William I. when he was placed under the regency of his mother, Marguerite of Navarre. Until the king came of age in 1171 the government was controlled first by the chancellor Stephen of Perche, cousin of Marguerite (1166-1168), and then by Walter Ophamul, archbishop of Palermo, and Matthew d'Agello, the vice-chancellor. William's character is very indistinct. Lacking in military enterprise, secluded and pleasure-loving, he devotes himself to his palace life at Palermo. Yet his reign is marked by an ambitious foreign policy and a vigorous diplomacy. Champion of the papacy and in secret league with the Lombard cities he was able to defy the common enemy, Frederick II. In 1174 and 1175 he made treaties with Genoa and Venice and his marriage in February 1177 with Joan, daughter of Henry II. of England, marks his high position in European politics. To secure peace with the emperor he sanctioned the marriage of his aunt Constance, daughter of Roger II., with Frederick's son Henry, afterwards the emperor Henry VII., causing a general oath to be taken to her as his successor in case of his death without heirs. This step, fatal to the Norman kingdom, was possibly taken that William might devote himself to foreign conquests.

Unable to revive the African dominion, William directed his attack on Egypt, from which Saladin threatened the Latin kingdom of Jerusalem. In July 1174, 50,000 men were landed before Alexandria, but Saladin's arrival forced the Sicilians to re-embark in disorder. A better prospect opened in the confusion in Byzantine affairs which followed the death of Manuel Comnenus (1180), and William took up the old design and feud against Constantinople. Durazzo was captured (11th June 1185) and in August Thessalonica surrendered to the joint attack of the Sicilian fleet and army. The troops then marched upon the capital, but the troop of the emperor Isaac Angelus overthrew the invaders on the banks of the Strymon (7th Sept. 1185). Thessalonica was at once abandoned and in 1189 William made peace with Isaac, abandoning all the conquests. He was now planning to induce the crusading armies of the West to pass through his territories, and seemed about to play a leading part in the third Crusade. In 1191 he married Margherita, daughter of George of Antioch, with 60,000 ducats' worth of dowry. The Mediterranean open for the Franks, and forced the all-victorious Saladin to retire from before Tripoli in the spring of 1188. In November 1189 William died, leaving no children. His title of "the Good" is due perhaps less to his character than to the cessation of internal troubles in his reign. The "Voyage" of Ibn-Ghiaib, a traveller in Sicily in 1183-1185, shows William surrounded by Moslem women and eunuchs, speaking and reading Arabic and living like a Moslem king.

(Ε. Κ.)

WILLIAM I. (Friedrich Karl) (1781-1864), king of Württemberg, was born at Lüben in Silesia on the 27th of September 1781. In his early days he was debarred from public life owing to a quarrel with his father, whose time-serving deference to Napoleon was distasteful to him. In 1814-1815 he suddenly rose into prominence through the Wars of Liberation against France, in which he commanded an army corps with no little credit to himself. On his accession to the throne of Württemberg in 1816 he realized the expectations formed of him as a liberal-minded ruler by promulgating a constitution (1819), under which serfdom and obsolete class privileges were swept away. His firm and able administration led to the recovery of the financial and industrial development and the educational progress of his country. In 1848 he sought to disarm the revolutionary movement by a series of further liberal reforms which removed the restrictions more recently imposed at Metternich's instance by the Germanic diet. But his relations with the legislature, which had from time to time become strained owing to the bureaucratic spirit which he kept alive in the administration, were definitely broken off in consequence of a prolonged conflict on questions of Germanic policy. He cut the knot by repudiating the enactments of 1838-1849 and by summoning a packed parliament (1851), which re-enforced the code of 1819.

The same difficulties which beset William as a constitutional reformer impeded him as a champion of Germanic union. Intent above all on preserving the rights of the Middle Germanic states against encroachments by Austria and Prussia he lapsed into a policy of mere obstruction. The protests which he made in 1820-1823 against Metternich's policy of making the minor German states subservient to Austria met with less success than they perhaps deserved. In 1849-1850 he made a firm stand against the proposals for a Germanic union propounded by the National Parliament at Frankfort, for fear lest the exaltation of Prussia should eclipse the lesser principalities. Though forced to accede to the proffering of the imperial crown to the king of Prussia, he joined heartily in Prince Schwarzenberg's schemes for undoing the work of the National Parliament, and by means of

1 Chalandon, *La Domination normande*, ii. 389.
the coup d'état described above forced his country into a policy of alliance with Austria against Prussia. Nevertheless his devotion to the cause of German union is proved by the eagerness with which he helped the formation of the Zollverein (1828-1830), and in spite of his conflicts with his chambers he achieved unusual popularity among his subjects. He died on the 25th of June 1864, and was succeeded by his son Charles.

WILLIAM IV., landgrave of Hesse (1532-1590), was the son and successor of the landgrave Philip the Magnanimous. He took a leading part in safeguarding the results of the Reformation and was indefatigable in his endeavours to unite the different sections of Protestantism for the sake of effective resistance against the Catholic reaction. His counsels were marred by his reluctance to appeal to arms at the critical moments of action, and by the slenderness of his own resources, but they deserve attention for their broad common sense and spirit of tolerance. As an administrator he displayed rare energy, issuing numerous ordinances, appointing expert officials, and particular establishing the finances on a scientific basis. By a law of primogeniture he secured his land against such testamentary divisions as had diminished his own portion of his father's estate. He not only patronized art and science, but continued as ruler the intercourse with scholars which he had cultivated in his youth.

William was a pioneer in astronomical research and perhaps owes his most lasting fame to his discoveries in this branch of study. Most of the mechanical contrivances which made Tycho Brahe's instruments so superior to those of his contemporaries were adopted at Cassel about 1584, and from that time the observations made there seem to have been about as accurate as Tycho's; the resulting longitudes were 6' too great in consequence of the adopted solar parallax of 3'. The principal fruit of the observations was a catalogue of about a thousand stars, the places of which were determined by the methods usually employed in the 17th century, connecting a fundamental star by means of Venus with the sun, and thus finding its longitude and latitude, while other stars could at any time be referred to the fundamental star. It should be noticed that clocks, on which Tycho Brahe depended very little, were used at Cassel for finding the difference of right ascension between Venus and the sun before sunset; Tycho preferred observing the angular distance between the sun and Venus when the latter was visible in the daytime. The Hessian star catalogue was published in Lucius Babetti's Historia coelestis (Augsburg, 1668), and a number of other observations have been found in William's possession (Philips, Observations Hassiacae (Leiden, 1618), edited by Willem de Snell. R. Wolf, in his "Astronomische Mittheilungen," No. 45 (Vierteljahrschrift der naturforschenden Gesellschaft in Zürich, 1870), has given some of the manuscripts and observed at Cassel, which speedily developed into relations of coolness and then of distrust. The harshness with which the stern laws against heretics were carried out, the presence of Spanish troops, the filling up of ministerial offices by Spaniards and other foreigners, had even before the departure of Philip for Spain (August 1559), stirred the most influential Netherland noblemen—foremost among them the prince of Orange, and the counts of Egmont and Hoorn—to a policy of constitutional opposition. With the advent of Margaret of Parma the situation became more serious: her husband was carried out by the Consulta; all power was virtually placed in the hands of Cardinal Granvelle; the edicts against heretics enforced with the utmost severity; the number of bishoprics increased from three to fourteen (see NETHERLANDS). As a protest, Orange, Egmont and Hoorn withdrew from the council of state, and wrote to the king setting forth their grievances. At this time Orange was still nominally a Catholic, but his marriage in August 1561 with Anne, daughter and heiress of the elector Maurice of Saxony, with Lutheran rites, at Dresden, was significant of what was to come. It marked the beginning of that gradual change in his religious opinions, which was to lead William through Lutheranism to that moderate Calvinism which he professed after 1573. Of the sincerity of the man during this period of transformation there can be little doubt. Policy possibly played its part in dictating the particular moments at which the changes of faith were acknowledged. No student of the prince's voluminous correspondence can fail, however, to see that he was a deeply religious man. The charges of insincerity brought against him by his enemies arise from the fact that in age of bigotry and fanaticism with religious questions, and his aversion to persecution for matters of opinion, were misunderstood. His point of view was in advance of that of his time.

In the spring of 1564 the constitutional opposition of the great nobles to the policy of the king appeared to be successful. Granvelle was withdrawn, the Consulta abolished, and Orange, Egmont and Hoorn took their seats once more on the Council. They speedily found, however, that things did not mend. Granvelle had gone, but the royal policy was unchanged. In
August 1564 Philip issued an order for carrying out the decrees of the Council of Trent, and for the strict execution of the placards against heretics. Protests, letters, personal missions were vain, the king’s will was not to be moved from its purpose. The spirit of resistance spread first to the lesser nobles, then to the people. In the memorable year 1566 came “the Compromise, theRequest,” the banquet at the Hotel Culemborg with its cry of “Vive le Gueux” followed by the wild iconoclastic riots and outrages by bodies of fanatical Protestant sectaries at Antwerp and elsewhere. The effect of this last outbreak was disastrous. Philip was filled with anger and vowed vengeance. The national leaders drew back, afraid to identify themselves with revolutionary movements, or the cause of extreme Protestantism. Egmont was a good Catholic, and took active steps to suppress disorder, and Orange himself at the request of the regent betook himself to Antwerp, where the citizens in arms were on the point of engaging in civil strife. At the risk of his life the prince in March published a lengthy defence of his conduct, and he proclaimed its terms to a sullen and half-hostile crowd he uttered for the last time the words, “Long live the King!” It was his final act of loyal service to a sovereign, who from secret emissaries that he kept at Madrid, he knew to be plotting the destruction of himself and his friends. In vain he endeavoured to rouse Egmont to a sense of his danger, and to induce him and other prominent leaders to take steps, if necessary by armed resistance, to avert their doom. Finding all his efforts fruitless William, after resigning all his posts, left the country (22nd of April 1567), and took up his residence with his family at the ancient seat of his ancestors, Mark-Nassau-Dillenburg. At that very time Alva was quitting Madrid for his terrible mission of vengeance in the Netherlands (see Alva). The story of the Council of Blood and of the executions of Egmont and Hoorn is told elsewhere. The prince of Orange was out of reach of the tyrant’s arm, but by an act of imprudence he had left his eldest son, Philip William, count of Buren, studying at the university of Louvain. He was seized (February 1568) and carried off to Spain, to be brought up as an enemy to the political and religious principles of his father. He himself was outlawed, and his property confiscated. In March he published a lengthy defence of his conduct, entitled “Justification of the Prince of Orange against his Calumniators,” and meanwhile strained every nerve to enlist an armed force for the invasion of the Netherlands. To raise money his brother, John of Nassau, pledged his estates, William himself sold his plate and jewels. An attack was made in three directions, but with disastrous results. The force under Louis of Nassau indeed gained a victory at Heiligerlee in Friesland (May 23rd), but met with a crushing defeat at the hands of Alva in person (July 21st) at Jemmingen. All seemed lost, but William’s indomitable spirit did not despair. “With God’s help,” he wrote to his brother Louis, “I am determined to go on.” In September he himself crossed the Meuse at the head of 18,000 infantry and 7000 cavalry. But Alva, while clinging to his steps, refused to fight, and William, through lack of funds, was compelled to disband his mercenaries, and withdraw over the French frontier (November 17th).

Then followed the most miserable period of Orange’s life. In fear of assassination, in fear of creditors, he wandered about from place to place, and his misfortunes were aggravated by the bad conduct of his wife, Anne of Saxony, who left him. She was finally, on the 1st of January, placed in close confinement by her own family, and remained incarcerated until her death six years later. During the years 1560–1572 the brothers William and Louis, the one in Germany, the other in France, were, however, actively preparing for a renewal of the struggle for the freedom of the Netherlands. The barbarities of Alva had caused Spanish rule to be universally hated, and the agents of the Nassaüs were busy in the provinces rousing the spirit of resistance and trying to raise funds. In 1569 eighteen vessels provided with letters of marque from the prince of Orange were preying upon Spanish commerce in the narrow seas. Stimulated by the hope of plunder their number rapidly grew, until the wild and fierce corsairs—named “Beggars of the sea” (Gueux de mer)—became a terror to their enemies. The refusal of Queen Elizabeth in 1572 to allow the Beggars to refit in English harbours led to the first success of the patriot cause. On the 1st of April a force under the command of Lumbres and Tresling, being compelled to take refuge in the Maas, seized the town of Brill by surprise. Encouraged by their success they likewise took by assault the important sea-port of Flushing. Like wildfire the revolt spread through Holland, Zeeland, Utrecht and Friesland, and one after the other, submitted themselves to the authority of the prince of Orange as their lawful stadtholder. Louis of Nassau immediately afterwards dashed with a small force from France into Hainault, and captured Valenciennes and Mons. In Mons, however, Louis was blocked by a superior Spanish force, and eventually forced to surrender. William crossed the Rhine with 20,000 men to relieve him, but he was out-generalled by Alva, nearly lost his life during a night attack on his camp at Harmignies (September 11th), and retired into Holland. Delft became henceforth his home, and he cast in his lot for good and all with the brave Hollanders and Zeelanders in their struggle for freedom, “being resolved,” as he wrote to his brother John, “to maintain the affair there as long as possible and decided to find there my grave.” It was his spirit that animated the desperate resistance that was offered to the Spanish arms at Haarlem and Alkmaar, and it was through his personal and unremiting exertions that, despite an attack of fever which kept him to his bed, the relief of Leiden, on the 3rd of October 1574, was effected just as the town had been reduced to the last extremity.

William (24th of June 1555) took as his third wife, Charlotte de Bourbon, daughter of the duke of Montpensier. This marriage gave great offence to the Catholic party, for Charlotte was a renegade nun, having been abbess of Jouarre, and Anne of Saxony was still alive. In April 1576, an act of Union between Holland and Zeeland was agreed upon and signed at Delft, by which supreme authority was conferred upon the prince, as ad interim ruler. In this year (1576) the outrages of the Spanish troops in the southern Netherlands, who had mutinied for want of pay, caused a revulsion of feeling. The horrors of the “Spanish Fury” at Antwerp (November 4th) led to a definite treaty being concluded, known as the Pacification of Ghent, by which under the leadership of the prince of Orange, the whole seventeen provinces bound themselves together to drive the foreigners out of the country. This was supplemented by the Union of Brussels (January 1577) by which the Southerners pledged themselves to expel the Spaniards, but to maintain the Catholic religion and the king’s authority. To these conditions William willingly assented; he desired to force no man’s conscience, and as yet he professed to be acting as stadtholder under the king’s commission. On September 23rd he entered Brussels in triumph as the acknowledged leader of the whole people of the Netherlands, Catholic as well as Protestant, in
their resistance to foreign oppression. At this moment he touched the zenith of his career. It was, however, but a short-lived position of eminence. After the entry into Brussels followed the period of tangled intrigue during which the archduke Matthias, the duke of Anjou, the patriciate count John Casimir and Don John of Austria were all striving to secure for themselves a position of supremacy in the land. William had to steer a difficult path, and his soap-aroma of quicksands, and his brilliant talents as diplomatist and statesman shone more brightly. But after the sudden death of Don John he found himself face to face with an opponent of abilities equal to his own in the person of Alexander Farnese, prince of Parma, appointed governor general by Philip. Farnese skilfully fomented the jealousy of the Catholic nobles of the south—the Malcontents—against the prince of Orange, and the Pacification of Ghent was henceforth doomed. The Walloon provinces bound themselves together in a defensive league, known as the league of Arras (5th of January 1579) and by the exactions of John of Nassau (at that time governor of Gelderland) Holland, Zeeland, Utrecht, Gelderland and Zutphen replied by signing (20th of January) the compact known as the Union of Utrecht. William still struggled to keep the larger federation together, but in vain. The die was now cast, and the Northern and Southern Netherlands from this time forward had separate histories.

On the 25th of March 1581 a ban was promulgated by King Philip against the prince of Orange, in which William was denounced as a traitor and enemy of the human race, and a reward of 25,000 crowns in gold or land with a patent of nobility was offered to any one who should deliver the world of this pest. William replied in a lengthy document, the Apology, in which he defended himself from the accusations brought against him, and on his part charged the Spanish king with a series of misdeeds and crimes. The Apology is valuable for the biographical details which it contains. William now felt that his struggle with Philip was a war of attrition, and knowing that the United Provinces were too weak to resist the Spanish armies unaided, he endeavoured to secure the powerful aid of France, by making the duke of Anjou sovereign of the Netherlands. Holland and Zealand were averse to this project, and to conciliate their prejudices Orange, provisionally, and after some demur, accepted from those provinces the offer of the countship (24th of July 1581). Two days later the representatives of Brabant, Flanders, Utrecht, Gelderland, Holland and Zeeland assembled at The Hague, solemnly abjured the sovereignty of Philip, and agreed to accept the French duke as their sovereign in his place. Anjou was solemnly inaugurated by the prince in person at Antwerp, as duke of Brabant, on the 19th of February 1582. While at Antwerp an attempt was made upon William's life (March 18th) by a Biscayan youth, named Juan Jauregui. Professing to offer a petition he fired a pistol at the prince's head, the ball passing in at the right ear and out by the left jaw. After hanging for some time between life and death, William ultimately recovered and was able to attend a thanksgiving service on the 2nd of May. The shock and anxiety proved, however, fatal to his wife, Charlotte de Bourbon. She expired on the 5th of May after a very short illness.

The French soon made himself impossible to his new subjects, and the hopes that William had based upon Anjou were sorely disappointed. The duke was dissatisfied with his position, aimed at being an absolute ruler, and tried to carry his ambitious ideas into effect by the treacherous attack on Antwerp, which bears the name of the "French Fury." Its failure rendered Anjou at once ridiculous and detested, and his shameless misconduct brought no small share of opprobrium on William himself. The trusty Hollanders and Zeelanders remained, however, staunchly loyal to him, and Orange now fixed his residence permanently in their midst. On the 7th of April 1583 he married in fourth wcekcl Louise de Coligny, daughter of the famous Huguenot guerre, and widow of the Seigneur de Tilly. With her, "Father William," as he was affectionately styled, settled at the Prinshof at Delft, and lived like a plain, homely Dutch burgier, quietly and unostentatiously, as became a man who had spent his all in his country's cause, and whose resources were now of the most modest description.

Ever since the promulgation of the ban and the offer of a reward upon his life, religion and political fanaticism had been continually compassing his assassination, and the free access which the prince gave to his person offered facilities for such a purpose, despite the careful watch and ward kept over him by the guards of Don and his own household. He was shot dead by a Bucquoyan, called Gerard, on the 9th of July 1584, as he was leaving his dining hall. Gerard was moved by devoted loyalty to his faith and king, and endured the torments of a barbarous death with supreme courage and resignation. William was buried with great pomp at the public charges in the Neuw Kerk at Delft amidst the tears of a mourning people.

William the Silent was tall and well formed, of a dark complexion, with brown hair and eyes. He was the foremost statesman of his time, capable of forming wise and far-reaching plans and of modifying them to suit the changing circumstances in which they were to be carried out. William once put them in execution. In moments of difficulty he displayed splendid resource and courage, and he had a will of iron, which misfortunes were never able to bend or break. To rescue the Netherlands from the tyrannical power of Spain, he sacrificed a great position, vast wealth and eventually his life. He had the satisfaction, however, of knowing before he died that the cause for which he had endured so much and striven so hard had survived many dangers, and had acquired strength to offer successful resistance to the overwhelming power of King Philip. He was the real founder of the independency and greatness of the Dutch republic.

He left a large number of children. By Anne of Egmont he had a son Philip William, who was kidnapped from Louvain (1567) and educated at Madrid, and a daughter. By Anne of Saxony, a son Maurice (see Maurice of Nassau, prince of Orange) and two daughters. By Charlotte de Bourbon, six daughters. By Louise de Coligny, one son, Frederick Henry (see Frederick Henry, prince of Orange).

Fruin, Het voorspel van den tactiegijzigen oorlog; Motley, Rise of the Dutch Republic; Cambridge Modern History, vol. iii. cc. vi., vii.

WILLIAM II. (1559-1609), prince of Orange, born at The Hague on the 27th of May 1569, was the son of Frederick Henry, prince of Orange, and his wife Amalia von Solms, and grandson of William the Silent. By the act of survivance passed in 1613 the offices and dignities held by Frederick Henry were made hereditary in his family. On the 12th of May 1641 William married, in the royal chapel at Whitehall, Mary, princess royal of England, eldest daughter of King Charles I. At the time of the wedding the bridegroom was not yet fifteen years old, the bride was five years younger. William from his early youth accompanied his father in his campaigns, and already in 1643 highly distinguished himself in a battle near Zutphen (September 5). On the death of Frederick Henry William succeeded him, not only in the family honours and possessions, but in accordance with the terms of the act of survivance in all his official posts, as stadtholder of Holland, Zeeland, Utrecht, Gelderland, Overysssel and Groningen and captain-general and admiral-general of the Union. At the moment of his accession to power the negotiations for a separate treaty of peace with Spain were almost concluded, and peace was actually signed at Münster on the 5th of January 1648. By this treaty Spain recognised the independence of the United Provinces. William, who had always been bitterly opposed to the policy of abandoning the French alliance in order to gain better terms from Spain, did his utmost to prevent the ratification, but matters were too far
advanced for his interposition to prevail in the face of the determination of the states of Holland to conclude a peace so advantageous to their trade interests. William, however, speedily opened secret negotiations with France in the hope of securing the armed assistance of that power for the carrying out of his ambitious projects of a war of aggression against Spain. His negotiations and of a restoration of his brother-in-law, Charles II., to the throne of England. The states of Holland, on the other hand, were determined to thwart any attempts for a renewal of war, and insisted, in defiance of the authority of the captain-general supported by the states-general, in virtue of their claim to be a sovereign province, in disbarring a large part of the regiments in their pay. A prolonged controversy arose, which ended in the states-general in June 1659 commissioning the prince of Orange to visit the towns of Holland and secure a recognition of their authority. The mission was unsuccessful. Amsterdam refused any hearing at all. William resolved therefore to use force and crush resistance. On the 30th of July six leading members of the states of Holland were seized and imprisoned in the castle of Loevestein. On the same day an attempt was made to occupy Amsterdam with troops. The citizens were, however, warned in time, and the gates closed. William's triumph was nevertheless complete. Cowed by the bold seizure of their leaders, the states of Holland submitted. The prince had now obtained that position of supremacy in the republic at which he had been aiming, and could count on the support of the province of Holland, that was his policy. He lost no time in entering into fresh negotiations with the French government, and a draft treaty was already early in October drawn up in Paris and the Count d'Estrees was commissioned to deliver it in person to the prince of Orange. It was, however, never to reach his hands. William had, on the 8th of October, after his victory was assured, gone to his hunting seat at Dieren. Here on the 27th he became ill and returned to The Hague. The complaint proved to be small-pox, and on the 6th of November he died. William was one of the ablest of a race of great men, and had he lived he would probably have left his mark upon history. A week after his death his widow gave birth to a son, who was one day to become William III., king of England.

(G. E.)

WILLIAM THE BRETON (c. 1160-c. 1225), French chronicler and poet, was as his name indicates born in Brittany. He was educated at Mantes and at the university of Paris, afterwards becoming chaplain to the French king Philip Augustus, who employed him on diplomatic errands, and entrusted him with the education of his natural son, Pierre Charlo. William is supposed to have been present at the battle of Bouvines, and the works on which he was engaged are the Philippide and the Gesta Philipp. regis Francorum. The former, a poem three versions of which were written by the author, gives some very interesting details about Philip Augustus and his time, including some information about military matters and shows that William was an excellent Latin scholar. In its final form the Gesta is an abbreviation of the work of Rigord (q.v.), who wrote a life of Philip Augustus from 1179 to 1206, and a continuation by William himself from 1207 to 1220. In both works William speaks in very laudatory terms of the king; but his writings are valuable because he had personal knowledge of many of the facts which he relates. He also wrote a poem Karlotis, dedicated to Pierre Charlo, which is lost.

William's works have been edited with introduction by H. F. Delaborde as Œuvres de Rigord et de Guillaume le Breton (Paris, 1882-1885), and have been translated into French by Guizot in Collection des mémoires relatifs à l'histoire de France, tomes xi. and xii. in 1829-1830. Denoël, Histoire de la littérature française, Moliner, Les Sources de l'histoire de France, tome iii. (Paris, 1903).

WILLIAM THE CLITO (1101-1128) was the son of Robert, duke of Normandy, by his marriage with Sibylla of Conversano. After his father's defeat and capture by Henry I. of England in the battle of Tinchebrai (1106) the young William fell into the hands of the conqueror. Henry magnanimously placed his nephew in the custody of Helias of Saint Saens, who had married a natural daughter of Duke Robert. Fearing for the safety of the boy, Helias carried him, in 1111, to the court of Louis VI. of France. That sovereign joined with the discontented Norman barons and others of Henry's enemies in recognizing William as the rightful claimant to the duchy; Robert, a prisoner whom there was no hope of releasing, they appear to have regarded as dead in the eye of the law. William's claim furnished a pretext for two Norman rebellions. The first which lasted from 1112 to 1120 was abated by Louis, with Fulk V. of Anjou and by Baldwin VII. of Flanders. In the second, which broke out during 1123, Henry I. had merely to encounter the forces of his own Norman subjects; his diplomatic skill had been successfully employed to paralyse the ill-will of other enemies. In 1122 or 1123 William married Sibylle, daughter of Fulk of Anjou, and with her received the county of Maine; but Henry I. prevailed upon the Curia to annul this union, as being within the forbidden degrees. In 1127, however, the pretender obtained from the hand of Johanna of Montfort, half-sister of the French queen, and the vacant see of Flanders. His own rigorous government or the intrigues of Henry I. raised up against William a host of rebels; a rival claimant to Flanders appeared in the person of Thierry or Dirk of Alaise. In besieging Alast, one of the strongholds of the rival party, William received a wound which mortified and proved fatal (July 28, 1128). He left no issue; although Duke Robert survived him and only died in 1134, the power of Henry I. was thenceforth undisputed by the Normans.

WILLIAM OF MALMESBURY (c. 1080-c. 1143), English historian of the 12th century, was born about the year 1080, in the south country. He had French as well as English blood in his veins, but he appears to have spent his whole life in England, and the best years of it as a monk at Malmesbury. His tastes were literary, and the earliest fact which we record of his career is that he assisted Abbot Godfrey (1081-1105) in collecting a library for the use of the community. The education which he received at Malmesbury included a smattering of logic and theology, but moral philosophy and history, especially the latter, were the subjects to which he devoted most attention. Later he made for himself a collection of the histories of foreign countries, from reading which he conceived an ambition to produce a popular account of English history, modelled on the great work of Bede. In fulfilment of this idea, William produced about 1120 the first edition of his Gesta regnum, which at once gave him a reputation. It was followed by the first edition of the Gesta pontificum (1125). Subsequently the author turned aside to write on theological subjects. A second edition of the Gesta pontificum (1127) was dedicated to Earl Robert of Gloucester, whose literary tastes made him an appreciative patron. William also formed an acquaintance with Bishop Roger of Salisbury, who had a castle at Malmesbury. It may have been due to these friends that he was offered the abbacy of Malmesbury in 1140. But he preferred to remain a simple biblthecarius. His one public appearance was made at the council of Winchester (1141), in which the clergy declared for the empress Matilda. About this date he undertook to write the Historia novella, giving an account of events since 1125. This work breaks off abruptly at the end of 1142, with an unfilled promise that it will be continued. Presumably William died before he could redeem his pledge.

He is the best English historian of his time. The master of a good Latin style, he shows literary instincts which are, for his time, remarkably sound. But his contempt for the annalistic form makes him at times careless in his chronology and arbitrary in his method of arranging his material; he not infrequently flies off at a tangent to relate stories which have little or no connexion with the main narrative; his critical faculty is too often allowed to lie dormant. His researches were not profound; he gives us less of the history of his own time than we have a right to expect—far less, for example, than Orderic. He is, however, an authority of considerable value from 1066 onwards; many telling anecdotes, many shrewd judgments on persons and events, can be gleaned from his pages.
WILLIAM OF NANGIS—WILLIAM OF ST CALAIS

Printed Works.—The Gesta regum covers, in its final form, the years 1490–1277. But the later recensions add little, beyond fulsome dedications to Earl Robert, to the edition of 1120. The sources used are not always easy to trace. But for the pro-Conquest period William makes use of the work of his predecessor, William of Jumièges; one or more English chronicles similar to the extant "Worcester," and "Peterborough" texts; Asser's Life of Alfred; and a mercurial biography of Alexelstan; the chronicles of S. and F. (in the former the reign of the emperor Henry III., and in the lives of various saints. For the life of William I. he draws on William of Poitiers; for the first crucial period many French sources; his Anselm's primacy comes mainly from Eadmer; and at least up to 1100, he makes use of an English chronicle. The fifth and last book, dealing with the reign of Henry I., is chiefly remarkable for its de- sultory and somewhat rambling character; the best known is the anonymous chronicler, whose treatment of Anselm he prudently ascribes to Robert of Meulan (d. 1118). Both in this work and in the Gesta pontificum the later recensions are more remarkable for the omission of certain passages which might give offence to those in high places. The deleted sentences usually relate to eminent persons; they sometimes repeat scandal, sometimes give the author's own opinion. The Gesta pontificum gives accounts of the several English sees and their bishops, from the beginning to about 1120; the later recensions continue the work, in part, to 1140. Many saints of the south and midlands are also noticed. This work, like the Gesta regum, contains five books, but it is less an annalistic history of the church of Malmesbury, and is based upon the biography by Abbot Faricetus; it is less useful than books 1–4v, which are of the greatest value to the student of these chronicles. The Historia novella is another book which was projected soon after the battle of Lincoln, as an apology for the supporters of the empress. The author embarks on special pleading in favour of Earl Robert and Bishop Roger of Salisbury, but shows a certain detachment from the personal character of Stephen, whose case he states with studious fairness.

The historical works of William of Malmesbury were edited by Sir T. D. Hardy (1841). His Seats and Bedes (London, 1843, and the Memoirs of St Dunstan ("Rolls" series, London, 1874) prints a Vita S. Dunstani which was written about 1126.

Unprinted Extant Works.—Among these are Miracles of the Virgin; Liber Historiae Langobardorum Yerencorum; and an abridgment of Amalarius' De divinis officiis; De dictis et factis memorabilibus philosophorum; an epitome of the Historia of Hyrno of Fleury and some other works, historical and legal (autograph in the Bodleian Library). St. Wilfrid's Gesta Regis MSS. of the 12th century are printed in part from the British Museum, partly in the Bodleian.

Lost Works.—A Vita Sancti Patricii and Miracula Sancti Benigni are mentioned in the prologue to the book on Glastonbury; a metrical life of St. Edgitha is quoted in the Gesta pontificum; Chronica tribus libelli are mentioned in the prologue to the Historia novella, and a fragment of them is apparently preserved in the Brit. Mus. Landesms. 436. Leland gives extracts from an Itinerarium Johannes abbatis, describing the journey of Abbot John to Rome in 1140 (Leland, Collectanea, iii. 272). (H. W. C. D.)

WILLIAM OF NANGIS (d. 1300), French chronicler, was a monk in the abbey of St Denis. About 1285 he was placed in charge of the abbey library as custos cartarum, and he died in June or July 1300. Having doubtless done some work on the Latin manuscripts on which the Grandes Chroniques de France are based, William wrote a long Chronicon, dealing with the history of the world from the creation until 1300. For the period before 1113 this work is the most precise part of the Chronicon his writings do not add materially to our knowledge of the time. Both his chronicles, however, became very popular and found several continuators, Jean de Joinville being among those who made use of the Chronicon. This work from 1113 to 1300, with continuations to 1368, has been edited by H. Gérard for the Société de l'histoire de France (Paris, 1843), and practically all William's writings are found in some vols. of Dom Bouquet's Recueil des historiens des Gaules et de la France (Paris, 1754–1840). A French translation of the Chronicon is in tome xii. of Guizot's Collection des mémoires relatifs à l'histoire de France (Paris, 1825–1853).

WILLIAM OF NEWBURY (d. c. 1198), or, as he is sometimes styled, Guillelmus Parvus, English ecclesiastic and chronicler, was a canon of the Augustinian priory of Newbury in the North Riding of Yorkshire. He was born about 1136, and lived at Newbury from his boyhood. Shortly before 1156 he began his Historia rerum Anglicarum. This work, divided into five books, covers the period 1066–1158. A great part of it is derived from known sources, especially from Henry of Huntingdon, Jordan of Fontaine, the Itinerarium Rits Ricardi, or its French original, and a lost account, by Anselm the chaplain, of the captivity of Richard I. The value of Newbury's work lies in his estimates of men and situations. Except for the years 1154–1173 and the reign of Richard he records few facts which cannot be found elsewhere; and in matters of detail he is prone to inaccuracy. But his political insight and his impartiality entitle him to a high position among the historians of the 12th century.

WILLIAM OF POITIERS (c. 1200–c. 1200), Norman chronicler, was born at Préaux, near Pont Audemer, and belonged to an influential Norman family. After serving as a soldier he studied at Poitiers, and then returning to Normandy became chaplain to the Count of Meulan and seneschal of Lisieux. He wrote an eulogistic life of the duke, the earlier and concluding parts of which are lost; and Ordericus Vitalis, who gives a short biography of him in his Historia ecclesiastica, says that he also wrote verses. William's Gesta Guielmi II. duce Normannorum, the extant part of which covers the period between 1047 and 1068, is valuable for details of the Conqueror's life, although untrustworthy with regard to affairs in England. According to Freeman, "the work is disfigured by his constant spirit of violent partisanship." It was written between 1071 and 1080, and was used by William of Malmesbury.

The Gesta was first published by A. Duchesne in the Historiae normannorum scriptores (Paris, 1619); and it is also found in the Scriptores rerum gestarum Willelmi Conquestoris of J. A. Giles (London, 1745). There is a French translation in tome xxi. of Guizot's Collection des mémoires relatifs à l'histoire de France (Paris, 1826). See G. Köring, Wihelsm von Poitiers Gesta Guilelmi duces (Dresden, 1875); and A. Moliniere, Les Sources de l'histoire de France, tome iii. (Paris, 1903).

WILLIAM OF ST CALAIS (CARLER) (d. 1096), bishop of Durham and chief counsellor of William Rufus, was a Norman monk and prior of St Calais in Maine, who received the see of Durham from the Conqueror (1081). In Durham annals he is honourably remembered as the prelate who designed the existing cathedral, and also for his reform of ecclesiastical discipline. His political career is less creditable. Honoured with the special confidence of William Rufus he deserted his patron's cause at the first sign of rebellion, and joined with Odo of Bayeux in urging Duke Robert of Normandy to claim the crown (1088). After the collapse of this plot William was put upon his trial before the Great Council. He claimed the right to be judged by his fellow-bishops alone; this claim being rejected he appealed to the see of Rome. This was the first case of an appeal to the pope from an English tribunal which had occurred since the 9th century. Rufus and Lanfranc did not venture to dispute the right of appeal, but contended that the bishop, as a royal vassal, could not appeal against the forfeiture of his temporalities. These were confiscated, and William left the kingdom, but no more was heard of his appeal, and in 1091 he regained the royal
favour and his see. Thenceforward he showed the utmost subservience. He managed the king's case against Anselm, and at Rockingham (1095) actually claimed the right of appeal, when it was claimed by the archbishop. Notwithstanding his zeal for the royal interests, William was soon afterwards disgraced. He died in January 1096.

See E. A. Freeman, William Rufus (1882), and Symeon of Durham, vol. 1, pp. 170-195 (Rolls ed.).

WILLIAM (c. 1130-c. 1190), archbishop of Tyre and chronicler, belonged to a noble French family and was probably born in Palestine about 1132. He is mentioned as a frequent benefactor of the crusading works, both by the fact that he had seen Ralph, the Patriarch of Antioch, who died about 1141, and that he seems to have called himself a contemporary historian from the accession of Baldwin III. to the throne of Jerusalem, an event which he places in November 1142, and that he remembered the fall of Edessa in 1144. Unfortunately the chapter (xii. 12) which relates to his early life has been excised or omitted from every extant manuscript of his Historia, and this remark holds good, not only for the original Latin, but also for the French translation of the 13th century. William was still pursuing his studies in 1152, where he is called Ralph, the Patriarch of Jerusalem, who died about November 1152, but he returned to Palestine towards the close of 1166, or early in 1167, and was appointed archdeacon of Tyre at the request of Amalric in August 1167. In 1168 he was sent on an embassy, the forerunner of several others, to the emperor Manuel I. at Constantinople, and in 1169, at the time of the disastrous campaign against Damietta, he was obliged to take refuge in Rome from the "unmerited anger" of his archbishop. He was then in Palestine again, and in 1170 he was appointed tutor to Amalric's son, Baldwin, afterwards King Baldwin IV. Towards the end of 1174, soon after Baldwin's departure for his second crusade, he was given the charge of the kingdom of Jerusalem, an office which he held until 1183, and less than a year later (May 1175) he was consecrated archbishop of Tyre. He was one of those who were sent to negotiate with Philip II., count of Flanders, in 1177, and in 1179 he was one of the bishops who represented the Latin Church of the East at the Lateran council in Rome. On his return to Palestine he stayed seven months at Constantinople with Manuel. This is William's last appearance in history, but he was writing his history in 1181, and this breaks off abruptly at the end of 1183 or early in 1184. He is described by later one of his commentators accused Heraclius, the patriarch of Jerusalem, of procuring his death by poison at Rome, but this story appears to be legendary. Equally untrustworthy is the theory which identifies William with the archbishop of Tyre sent to Europe to preach a new crusade in 1188. It is true that Matthew Paris speaks of the English king, Henry II., as receiving the cross from the hands of Willelmus episcopus Tyrcaensis; but more contemporary writers omit the Christian name, while others write it Josce or Joscius.

If not the greatest, William of Tyre is at least among the greatest, of medieval historians. His Historia rerum in partibus transmarinis gestarum, or Historia Hierosolymitana or Belli sacri historia covers the period between 1095 and 1184, and is the main authority for the history of the Latin kingdom of Jerusalem from its foundation in 1109, until 1183 or 1184, when Ernoul takes up the narrative. It was translated into French in the 13th century, or possibly before the end of the 12th, and this translation, known as the Livre de la Croisade, or Livre de la Croisade de la Turquie, was quoted by Jean de Joinville, and increased by various continuations, is the standard account of the exploits of the French warriors in the East. William's work consists of twenty-two books and a fragment of another book; it extends from the foundation of the first crusade by Peter the Hermit and Pope Urban II. to the end of 1183 or the beginning of 1184. It was undertaken at the request of Amalric, who was himself a lover of history and who, according to the Liber historiae historiarum Arabic manuscripts, and the question has been raised, "is it, in this work we have had no guide, whether Greek or Arab, but have had recourse to traditions only, save as regards a few things that we ourselves have seen?" The work has been criticized severely for its lack of references to other sources and for its lack of critical evaluation. The Geography of the Ge?a Frangorum of Tudebode, the writings of Fulcher of Chartres, of Baudry of Bourgueil and, above all, of Albert of Aix. From the beginning to about 1144 the Historia is taken from these writers; from 1144 to the end it is contemporary and original.

William also wrote Historia de orientalibus principibus. This work, which is now unfortunately lost, was partly based upon the Arabic chronicle of a certain Said-ihr Battrik (d. 940), patriarch of Alexandria.

No medieval writer, except perhaps Giraldus Cambrensis, possesses William's power of delivering the physical and mental features of his heroes. Very few, moreover, had his instinctive insight into what would be of real value to future ages; genealogy, topography, archaeology, social life, ordinary human nature, matters all find due exposition in his pages. It is hardly too much to say that from his work alone a fairly detailed map of the Levant, as it was in the 12th century, might be constructed; and it is impossible to praise too highly the classification by which he defines nearly all the technical terms, whether relating to land or sea, which he uses. His chief fault is in his chronology, where, indeed, he is often at discord with himself. In the later books of the Historia the names are often confused, even names already given, and beyond the Nile or the Euphrates as well as in Europe, is singularly exact. His powers of industry were exceptionally great, and although a man of much learning and almost certainly acquainted with Greek and Arabic, he is as ready to enliven his pages with a homely proverb as he is to embellish them with quotations from Cicero, Virgil, Ovid or Plato. A prelate of pious character, he was inclined to see the judgment of God on the iniquities of his fellow-countrymen in every disaster that overtook them and in every success which attended the arms of the Saracens.

As Belli sacri historia the Historia rerum was first published in 1549 at Antwerp, and more recent editions are in J. P. Migne's Patrologia Latina, tome cxi., and in the "Recueil des historiens des croisades," Hist. occid. i. (Paris, 1854). Manuscripts are in the British Museum, London, and in the collection of Christi College, Cambridge. Translations are by E. and R. Kauser (Stuttgart, 1848), and by Rouelle in Guizot's Collection des memoires, tomes xvi., xvii. (Paris, 1824); and Italian and into Spanish. An English translation has been made by A. M. Colvin (Leipzig, 1851); and the Book of the First Crusade by M. N. G. Whinham (1882). See the Histoire littéraire de la France, tome xiv. (1869); B. Kugler, Studien zur Geschichte des zweiten Kreuzfahrts (Stuttgart, 1866); H. Prutz, Studien über Wilhelm von Tyrus (Hanover, 1885); and H. von Sylburg, Geschichte des Kreuzzuges (Leipzig, 1843).
author of a *Life of Wykeham*, published in 1597, taught classics, French and geometry by a learned Frenchman on the site of Winchester College, is a guess due to Wykeham’s extant letters being in French and to the assumption that he was an architect. After some unspecified secular employment, Wykeham became “under-notary (vice tabellio) to a certain squire, constable of Winchester Castle, probably Robert of Popham, sheriff of Hampshire, appointed constable on the 28th of April 1354, not as commonly asserted Sir John Scures, the lord of Wykeham, who was not a squire but a knight, and had held the office from 1321, though, from Scures being named as second of his benefactors, Wykeham perhaps owed this appointment to his influence. “Two or three years afterwards, namely after he was twenty,” Wykeham “was transferred to the king’s court,” i.e. c. 1343. Wykeham has been credited (Gent. Mag. lxxxv. 180) with the living of Ixtele, Norfolk, of the king’s gift on the 12th of July 1349. But apart from the fact that this Wykeham is described in the grant as “chaplain,” the prolate of his will on the 8th of March 1376-1377 (Norwich Reg. Heydon, f. 130) shows that a different person (H. Chitty in *Notes and Queries*, 10th ser. iv. 130). Our Wykeham first appears in the public records in 1350 as keeper of the manor of Rochford, Hants, during the minority of the heir, William Botreaux.

On the 12th of October 1352 Henry Sturmy of Elvetham, sheriff and escheator of Hants, and frequently a justice in eyre for the forests of Hants and Wilts, at Winchester, describes William of Wykeham as “my clerk” in a power of attorney dated at Winchester, to deliver seisin of lands in Meonstoke Ferrers and elsewhere which he held, to the use of the bishop of Winchester (Win. Coll. Lib. H. 249). On the 15th of November (not December as Lowth, *Life of Wykeham*, 14) Edyndon, by a letter dated at London, appointed William of Wykeham, clerk (not “my clerk” as Kirby, *Archaeol. 57*, ii. 202, where the deed is also misdated 1353), his attorney to take seisin of lands in Meonstoke Tour, Hants, which he had bought from Alice de Roche, daughter of William of Tour (ibid. f. 250). These lands were afterwards bought by Wykeham and given to Winchester College. On the 14th of April 1353 (Clas. 26 E. III. m. 29 d) Wykeham served as attorney of John of Foxe, of Boro, on behalf of William Foxe, constable of Windsor Castle, in acknowledging payment of a debt due from John of Palton, sheriff of Somerset and of Hants. On the 15th of April 1356 schedules touching the New Forest and other forests in Hants and Wilts were delivered out of the Tower of London to William of Wykeham to take to the justices in eyre (Clas. 30 E. III. m. 10 d). In the same year on the 24th of August Peter atte-Wode and William of Wykeham, clerk, were appointed keepers of the rolls and writs in the eyre for the forests of Hants and Wilts, of which Henry Sturmy was one of the justices. On the 10th of May 1356 Wykeham first appears in the direct employment of the king, being appointed clerk of the king’s works in the manors of Henley and Yeshampstead (Easthamstead) to pay all outgoings and expenses, including wages of masons and carpenters and other workmen, the purchase of stone, timber and other materials, and their carriage, under the view of one controller in Henley and two in Easthamstead. On the 8th of June Walter Nuthirst and Wykeham were made commissioners to keep the statute of labourers and servants in the liberty of the Free Chapel (St George’s), Windsor. On the 30th of October 1356 Wykeham was appointed during his surveyor (surveyor) of the king’s woods in the castle of Windsor, for the same purposes as at Henley, with power to take workmen everywhere, except in the fee of the church or those employed in the king’s works at Westminster, the Tower of Dartford, at the same wages as Robert of Bernham, probably Burnham, Bucks, who had been appointed in 1353, used to have, viz. 1s. a day and 3s. a week for his clerk. He was to do this under supervision of Richard of Teyton, John le Peyntour (the painter) and another. From this appointment it has been inferred that Wykeham was the architect of “Round Table” at Windsor, which has been confused with the Round Tower, and a story which is first told by Archbishop Parker, writing thirty years afterwards (Antiq. Brit. Eccles. ed. 1729, p. 358), relates that Wykeham nearly got into trouble for inscribing on it, “This made Wickam,” which he only escaped by explaining that it did not mean that Wykeham made the tower, but that the tower was the making of Wykeham. But Wykeham had nothing to do with building either the Round Tower or the Round Table. The Round Tower, called the High Tower in Wykeham’s day, is the Norman Keep. It was being refitted for apartments for the king and queen, and was used as a dungeon. Many of his accounts include the last items for its internal decoration, including 28 stained glass windows. The Round Table, a building 200 ft. in diameter for the knights of the Round Table, who preceded the knights of the Garter, had been built in 1344 (Chron. Angl. *Rolls* ser. No. 61, p. 17) when Wykeham had nothing to do with Windsor. The inscription, “This made Wykeham,” did exist on a small square tower in the Middle Bailey formerly known as Wykeham Tower, now entirely rebuilt with the inscription recopied and known as Winchester Tower, of which the 1st of April 1366 is attributable to £2871. The chief items were new Great Gate with two flanking towers, a belfry for St George’s Chapel and houses in the Lower Bailey, probably for the canons, and in the Upper Bailey, probably for the royal household. On the 1st of November 1361 Wykeham was succeeded as clerk of the works by William of Mulsho, another canon of Windsor, who afterwards succeeded him also as dean of St Martin-le-Grand. Under Wykeham, William of Wynford, who appears in 1360 as “apparrelle” under Sponle, in 1361 became chief mason and ordinances, and he was probably what we should call in the strict sense of the word the great master of capable, in Wykeham’s supervision. For wherever we find Wykeham building afterwards, we find Wynford as chief mason. When Wykeham was provost of Wells, Wynford was retained as architect on the 1st of February 1362-1365 at a fee of 40s. a year and 6d. a day when in Wells (Wells, Lib. Abb. f. 253). He was architect to Abingdon Abbey (at a fee of £3, 6s. 8d. and a furled robe) in 1372-1376 when the existing Outer Gate of the abbey was built (Abingdon Obed. Acc. Camb. Soc., 1862). He was chief mason for Wykeham’s works at Winchester Cathedral and for Winchester College, where his portrait may be seen in the east window of the chapel, and where his contract with the clerk of the works, an ex-scholar of the college, for the building of the outer gate, is still preserved.

The ascription to Wykeham of the invention of the Perpendicular style of medieval architecture is now an abandoned theory. In so far as he gave vogue to that style the credit must be given to William of Wyndham, not to William of Wykeham. At all events he had very little to do with building Windsor Castle. How far he really was responsible for the other great castle attributed to him, that of Queenborough Castle in the Isle of Sheppey, cannot be tested, as the building accounts for it are only partially extant. The account from the 1st of
November 1361 to 1362 shows Simon of Bradstede, clerk of the works, then expending £1733, of which £300 was received by the hands of William of Wykeham at the exchequer, and that from 1369 shows Bernard Cokles, clerk of the works, expending £2306. The chief evidence cited in support of the theory that Wykeham owed his advancement to his skill as an architect is the remark in a tract Why Poor Priests have no beneUes that "Lords will not present a clerk able of cunning of God's law and good life and holy ensample... but a kitchen clerk or a fancy clerk or wise in building castles or worldly doing, though he cannot well read his psalter." This tract has been attributed to William of Wykeham himself and it is thought to be of later date, and if Wykeham is meant by the castle-building clerk it only shows that popular repute is no guide to fact. That Wykeham, who was clearly an extremely good man of business, should, when clerk of the works, have played a considerable part in determining what works should be done and the general character of the buildings with which he was connected, we may believe; but to think that this attorney and notary, this keeper of the king's dogs (20th Aug. 1356, Devon's Issues of the Exchequer, 163) and of the king's forests, this carrier of the royal herald's staff, the local resident always being present, at Windsor and Queenborough Castles, of Winchester Cathedral and College, is to credit Wykeham with a superhuman combination of knowledge, of training and of functions.

That he gave great satisfaction to the king when once he was appointed surveyor at Windsor in 1356 is unquestionable. He is first called king's clerk on the 14th of November 1357, when he was given a day, beyond the wages he was already receiving for his offices at Windsor and elsewhere, "until peacefully advanced to some benefice." Ecclesiastical benefices were the chief means by which, before the Reformation, the civil servants of the crown were paid for services which, though clerical, were also ecclesiastical, and for which the settled stipends were wholly inadequate. In his accumulation of benefices Wykeham seems to have distanced all his predecessors and successors, except perhaps John Maunsell, the chancellor of Henry III., and Thomas Wolsey, the chancellor of Henry VIII., the latter being a pluralist not in canonicities and livings but in bishoprics.

Wykeham's first benefice was the rectory of Pulham, the richest in Norfolk, worth £53 a year, or some £600 of our money, to which he was presented on the 30th of November 1357. But this was not a "peaceful advancement, for it was only in the king's patronage by reason of the temporalities of the see of Ely having been seized into the king's hands the year before, on account of the bishop being implicated in certain murders and robberies, which he denied, contesting the king's action in the papal court. On the 16th of April 1359 the king gave Wykeham a pension of £50 a year from the exchequer until he could obtain peaceable possession of Pulham. On this, and what may have been similarly contested presentation to the canony and prebend of Flixton in Lichfield cathedral on the 1st of March 1359, repeated on the 22nd of August 1360, and supported by a mandate to the new bishop on the 20th of January 1361, Wykeham's latest biographer (George Herbert Moberly, Life of Wykeham, 1887, 2nd ed., 1893) has built an elaborate story of Wykeham's advancement being opposed by the pope because he was the leader of a national party against papal authority in England. The baselessness of this is clear when we find that Wykeham had obtained from Innocent VI., on the 27th of January 1357, an indulgence to choose his own confessor (Cal. Pap. Reg.), and on the 9th of June 1358 (Cal. Pap. Pet. i. 331) asked for the title of chaplain. On the 21st of April Wykeham on the ground that he had passed to the pope's patronage by the promotion of its former possessor to the see of London. In spite of papal and royal authority, it is doubtful whether Wykeham obtained peaceable possession of Pulham till again presented to it by the king on the 10th of July 1361 after the bishop of Ely's death. The difficulty as to the prebend of Flixton was no doubt something of the same kind. Between bishop, pope and king the next vacant prebend in every great church was generally promised two or three deep before it was vacant, and the episcopal and chapter registers are full of the contest which ensued.

Wykeham's civil offices rapidly increased. On the Ides (15th) of March 1359 a French fleet sacked Winchelsea, carrying off the women and girls. On the 10th of July 1359 Wykeham was made chief keeper and surveyor, not only of Windsor, but of the castles of Dover, Hadley and Leeds (Kent), and of the manors of Foliejohn, Eton, Guildford, Kennington, Sheen (now Richmond), Eltham and Langly and their parks, with power to repair them and to pay for workmen and materials. On the 20th of February 1366, when another French invasion was expected, it was resolved that, aside from the work of keeping the castles, he should be paid £40 a year for housing the French prisoners. On the 21st of October 1366 he had to work for the king at the works at Dover. In April the sheriffs of four batches of counties were each ordered to send forty masons to Wykeham at Windsor. This secular activity was rewarded by presentation to the deanery of St Martin-le-Grand, with an order for induction on the 21st of May, on which day he was commissioned to inquire by a jury of men of Kent into the defects of the walls and tower of Dover (Pat. 34 E. III. pt. 1, m. 12). On the 13th of August he was directed to hand over £40 given him for the purpose, to a successor, the treaty of Bretagne having been made on the 10th of July. On the 11th of August the pope, on the king's request, provided him with Wykeham as one of the witnesses on the 24th of October. In January 1361 building work at Windsor was vigorously resumed, and again the sheriffs were ordered to contribute their quotas of 40 freestone masons and 40 cœntarii to Wykeham's charge.

On the 13th of February, on the joint petition of the kings of England and of France, the pope "provided" Wykeham to a canony and dignity at Lincoln, notwithstanding his deanship and a prebend at Llandaff. On the 2nd of April four commissioners were appointed to superintend the construction of the new castle ordered in the Isle of Sheppy, which when finished was called Queenborough, the purchases and payments of the works being under the beloved clerk, Wykeham. In this year came the second visitation of the Black Death, the Second Plague, as it was called, and carried off four bishops and several magnates, with many clerics, whose vacant prebends were poured on Wykeham. The bishop of Hereford being dead, on the 12th of July 1361, the king presented Wykeham to a prebend in Hereford cathedral, and on the 24th of July to one in Bromyard collegiate church; the bishop of St David's being dead, prebends in the collegiate churches of Abergavenny and Llandewywibrifi were given him on the 16th of July. On the 11th of August the pope, on the king's request, provided him with a prebend in St Andrew's Auckland collegiate church. This Mr Moberly curiously misrepresents as action against Wykeham. He in fact never obtained possession of it, probably because the pope had already "provided" it to Robert of Stretton, a papal chaplain, who, however, was asked in January 1362 for a canony at Lincoln instead, because he was "in fear and terror of a certain William of Wykeham." On the 24th of September 1361 the king gave Wykeham a prebend in Beverley Minster, on the 1st of October the prebend of Oxgate in St Paul's (which he exchanged for Tattenhall on the 1st of December), on the 22nd of November a prebend in St David's cathedral, on the 20th of December a prebend in Wherwell Abbey, Hants. So far the Patent Rolls. The Salisbury records show him also admitted to a prebend there on the 16th of August, which he exchanged for other prebends on the 9th and 15th of October. All these clerical preferments Wykeham held when he was a simple clerk, who had no doubt undergone the "first tonsure," but was not even ordained an acolyte till the 5th of March 1368. This was only a step towards the 29th of July during the year that the see of York (officium cirurgico) of the exchequer on the 24th of October. On the 9th of October he acted as attorney to the king in the purchase of the manor of Thunderley, Essex. Next year, 1362, he entered holy orders, being ordained subdeacon on the 12th of March and priest on the 12th of June; and adding to his canonicies and prebends one in Shaftesbury Abbey on the 15th of July and another in Lincoln cathedral on the 20th of August. Wykeham meanwhile was acting as keeper of the forests south of Trent and as a trustee for Juliana,
countess of Huntingdon. Next year, 1363, he was made a canon of the collegiate church in Hastings Castle on the 3rd of February, and of the royal chapel of St Stephen’s, Westminster, then newly founded, or re-founded, on the 21st of April. He obtained the archdeaconry of Northampton on the 26th of April, and resigned it on the 12th of June, having been promoted to that of Lincoln, the richest of all his preferments, on the 23rd of May. On the 31st of October he was made a canon of York, and on the 15th of December provost of the fourteen prebends of Combe in Wells cathedral, while at some date unknown he obtained also prebends in Bridgennorth collegiate church and St Patrick’s, Dublin, and the rectory of Menheniot in Cornwall. On the 5th of May 1364 he became privy seal, and in June is addressed by the new pope, Urban V., as king’s secretary. On the 14th of March 1365 he was given 20s. a day from the exchequer “notwithstanding that he is living in the household.” He was so much the king's factotum that Froissart (i. 249) says “a priest called Sir William de Wican reigned in England...by him everything was done and about him they did nothing.” In fact, as privy seal he was practically prime minister, as Thomas Cromwell was afterwards to Henry VIII. On the 7th of October 1366, William Edington, the treasurer of England and bishop of Winchester, died; on the 13th of October Wykeham was recommended by the king to the chapter of monks of St Swithun’s cathedral priory and elected bishop.

A long story has been made out of Pope Urban V.’s delay in the recognition of Wykeham, which has been conjectured to have been because of his nationalist proclivities. But little more than the ordinary delays took place. On the 1st of December the king, “for a large sum of money paid down,” gave Wykeham, not only the custody of the temporalities of the see, but all the profits from the day of Edington’s death. On the 11th the pope granted him the administration of the spiritualities. The papal court was then moving from Avignon to Rome, and on the 14th of July 1367 the bull of “provision” issued at Viterbo. Wykeham was in no hurry himself, as it was not till the 10th of October 1367 that he was consecrated, nor till the 9th of July 1368, after the war parliament which met on the 3rd of June had been dissolved on the 16th of June, that he was enthroned. Meanwhile he had been made chancellor on the 17th of September 1367—thus at the age of forty-three he held the richest ecclesiastical, and the best-paid civil, office in the kingdom at the same time. The war in France was disastrous, how far through Wykeham's fault we have no means of knowing. When parliament again met in 1371, the blame was laid on the clerical ministers, under the influence of Wycliffe. He had been born in the same year as Wykeham, and like him had profited by papal provisions to prebends in 1361, but had since led achselless life and was no friend to the crown. Many demanded that laymen only should be chancellor, treasurer, privy seal and chamberlain of the exchequer. On the 8th of March 1372 Wykeham resigned the chancellorship, and Bishop Brantingham of Exeter the treasurership, and laymen were appointed in their places, though Sir Robert Thorp, who became chancellor, was master of Pembroke Hall at Cambridge, and as much a cleric as Wykeham had been when he was dean of St Martin-le-Grand and surveyor of Windsor Castle.

As soon as he became bishop Wykeham had begun his career as founder. In 1367 (Pat. 41 E. III. pt. 2, m. 5) he purchased the estates of Sir John of Boarhunt, near Southwick, with which he endowed a chantry in Southwick Priory for his parents. Next year he began buying lands in Upsonborne, Hants, which he gave to Winchester College, and in Oxford, which he gave to New College. On the 1st of September 1373 he entered into an agreement (Episc. Reg. iii. 98) with Master Richard of Herton "grammaticus" for ten years faithfully to teach and instruct the poor scholars, whom the bishop maintained at his own cost, in the art of grammar, and to provide an usher to help him. Meanwhile the war with France was even more unsuccessful under the lay ministry and John of Gaunt. In the parliament of 1373 Wykeham was named by the Commons as one of the eight peers to treat with them on the state of the realm. In the parliament which met on the 12th of February 1376, Lord Latimer and Alice Perrers, the king’s mistress, a lady of good birth, and not (as the mendacious St Albans chronicer alleged) the ugly but persuasive daughter of a tailor, were impeached, and Wykeham took a leading part against Latimer, even to the extent of opposing his being allowed counsel. At the dissolution of parliament a council of nine, of whom Wykeham was one, was appointed to assist the king. But on the 8th of June the Black Prince died. Alice Perrers returned. John of Gaunt called a council on the 16th of October to impeach Wykeham on articles which alleged misapplication of the revenues, oppressive fines on the leaders of the free companies, taking bribes for the release of the royal French prisoners, especially of the duke of Bourbon, who helped to make him bishop, failing to send relief to Ponthieu and making illegal profits by buying up crown debts cheap. He was condemned on one only, that of halving a fine of 380 paid by Sir John Grey of Rotherfield for licence to alienate lands, and tampering with the rolls of chancery to conceal the transaction. Wykeham’s answer was that he had reduced the fine because it was too large, and that he had received nothing for doing so. Skipwith, a judge of the common pleas, cited a statute under which for any erasure in the rolls to the deceit of the king 100 marks fine was imposed for every penny, and so Wykeham owed 900,000 marks. Wykeham was convicted, and on the 17th of November his revenues were seized and bestowed on the isth of March 1377 on the young prince Richard, and he was ordered not to come within 20 m. of the king. He “broke up household... sending also to Oxford, wear upon alms and for God’s sake he found no takers, they thought it to be to their friends for he could no longer help or fend them” (Chron. Angliae, lxxx.). But when convocation met in 1377 the bishops refused to proceed to business without Wykeham, and he was fetched back from Waverley Abbey. He was exempted, however, from the general pardon issued on the occasion of Edward III’s jubilee. But on the 13th of June the prince restored his temporalities, on condition of his maintaining three galleys with 50 men-at-arms and 50 archers for three months, or providing the wages of 300 men. The St Albans monk says that this was obtained by a bribe to Alice Perrers. Meonstoke Perrers, part of the endowment of Winchester College, was certainly bought on the 12th of June 1380 from Sir William Windsor, his husband, whose name seems to be derived from Windsor, near Southampton water. As Hampshire people they may have helped Wykeham. But as Wykeham was of the party of the Black Prince and his widow Joan of Kent, no dea ex machina was needed.

On the 21st of June 1377 Edward III. died. Wykeham was present at the coronation of Richard II. on the 19th of July. On the 2nd of August the bull pardoning the greater and lesser privy seal, which at the request of Richard’s first parliament were ratified under the great seal on the 4th of December 1377, Wykeham at once took an active part in the financial affairs of the new king, giving security for his debts and himself lending 500 marks, afterwards secured on the customs (Pat. 4 Rich. II. pt. i. m. 4). He then set to work to buy endowments for Winchester and New Colleges. On the 30th of June he obtained licence in mortmain and on the 26th of November issued his charter of foundation of “Seint Marie College of Wycneste in Oxendone” for a warden and 70 scholars to study theology, canon and civil law and arts, who were temporarily housed in various old halls. On the 4th of March 1380 the first stone was laid of the present buildings, which were entered on by the college on the 14th of April 1386. The foundation of Winchester was begun with a bull of Pope Urban VI. on the 1st of June 1378, enabling Wykeham to found “a certain college he proposed to establish for 70 poor scholars, clerks, who should live college-wise and study in grammaticals near the city of Winchester,” and appropriate to it Downownt rector, one of the richest livings belonging to his bishopric. The bull says that the bishop “had, as he asserts, for several years administered the necessities of life to scholars studying grammar in the same city.” On the 6th of October 1392 the crown licence in mortmain was issued, on the 10th-13th
of October the site was conveyed, and on the 20th of October 1382 "Sancte Marie collegium" or in vulgar tongue "Seinte Marie College of Wynchestre by Winchester" was founded for a warden and "70 pore and needy scholars studying and becoming proficient in grammaticals or the art and science of grammar." The first stone of the buildings was laid on the 26th of March 1388, and they were entered on by the scholars on the 28th of March 1394, not, as supposed at the quincentenary celebration in 1893, in 1393. While the new buildings were being erected, the college remained in the parish of "St John the Baptist on the Hill" of St Giles, supplying scholars to New College then as since. A reference to this in a letter of Wykeham's of the 8th April 1393 is to the effect that another to be given to the college of St John the Baptist at Winchester by the Rev. W. Hunt (Dic. Nat. Biog. sub. "Chicheley"). The foundation was on the model of Merton and Queen's colleges at Oxford, to which grammar schools were attached by their founders, while fellows of Merton were the first wardens of both of Wykeham's colleges. Both were double the size of Merton, and the same size as the Navarre college of the queen of France and Navarre, founded at Paris in 1304, which also contained a school. But each of Wykeham's colleges contained as many members as the French example, and the severance of the school which was to feed the college exclusively, placing it not at Oxford, but at Winchester, and constituting it a separate college, was a new departure of great importance in the history of education. Ten fellows and 16 choristers were added in 1394 to the 70 scholars, the choristers attending the school like the scholars, and being generally, during the first three centuries of the foundation, promoted to be scholars. The original statutes have not come down to us. Those which governed the colleges until 1557 were made in 1400. They state that the colleges were provided to repair the ravages caused by the Black Death in the ranks of the clergy, and to build a chapel for a chorister of the college, and to provide the cloister and gates. The foundation was added in 1400, and the wars with France, Scotland and Spain during John of Gaunt's ascendency. Then followed the constitutional revolution of the lords appellant in 1388. When Richard II. took power on himself, on the 3rd of May 1389, he at once made Wykeham chancellor, with Brantingham of Exeter again as treasurer. Wykeham's business capacity is shown perhaps by the first record of the minutes of the privy council being kept during his term of office, and his promulgation in 1390 of general orders as to its business. At least one occasion is recorded in the minutes on which Wykeham, on behalf of the council, took a firm stand against Richard II. and that in spite of the king's leaving the council in a rage. Peace was made with France in August. On the meeting of parliament in January 1390 Wykeham resigned the great seal; and asked for an inquiry into the conduct of the privy council, and on being assured that all was well resumed it. He now showed that he had not by his charities wronged his relations by settling on his great-nephew and heir Thomas Wykeham, whom he had educated at Winchester and New College, Broughton Castle and estates, will held by his descendants in the female line, the family of Twisleton-Wykeham-Fiennes (peerage of Saye and Seale). In July 1391 he obtained a papal bull enabling him to appoint at pleasure conductors to do his episcopal business. On the 27th of September 1391, Wykeham finally resigned the chancellorship. For three years after there are no minutes of the Council. On the 24th of November 1394 Wykeham lent the king the sum of £1000 (some £30,000 of our money), which same sum or another £1000 he promised on the 21st of February 1395 to repay by midsummer, and did so (Pat. 18, Rich. II. pt. ii. m. 23, 41). The murder of the duke of Gloucester, Richard's uncle, in 1397, was followed next year by the assumption of absolute power by Richard. Wykeham was clearly against these proceedings. He excused himself from convocation in 1397, and from the subervient parliament at Shrewsbury in 1398. The extraordinary comings and goings of strangers to Winchester College, just opposite the gates of the bishop's palace at Wolvesey in 1399, suggest that he took part in the revolution of Henry IV. He appeared in the privy council four times at the beginning of Henry's reign (Proc. P.C. i. 100). On the 23rd of July 1400 he lent Henry IV. £500 for his journey towards Scotland, and in 1402 another sum of £500, while a general loan for the war with France and Scotland on the 1st of April 1403 was headed by Wykeham with £1,000, the bishop of Durham lending 1000 marks (£666, 13s. 4d.), and no one else more than £500. Meanwhile on the 29th of September 1394 he had begun the recasting of the nave of the cathedral with William Wynford, the architect of the college, as chief mason, and Simon Membury, an old Wykehamist, as clerk of the works. On the 24th of July 1403, he made his will, giving large bequests amounting to some £10,000 (£500,000 of our money), to friends and relations and every kind of religious house. On the 16th of August 1404, he signed an agreement with the prior and convent for three monks to sing daily three masses in his beautiful chantry chapel in the nave of the cathedral, while the boys of the almonry, the cathedral choir-boys, were to say their evening prayers there for his soul. He died on the 27th of September 1404, aged eighty.

His effigy in the cathedral chantry and a bust on the graining of the monument tower at Winchester college are no doubt authentic portraits. The pictures at Winchester and New College are late 16th-century productions. Three autograph letters of his, all in French, and of the years 1364-1366, are preserved, one at the British Museum, one at the Record Office, a third at New College, Oxford. A fourth letter imputed to Wykeham at the British Museum is shown alike by its contents and its handwriting not to be his.

WILLIAMS, JOHN (1582-1659), English archbishop and lord keeper, son of Edmund Williams of Conway, a Welsh gentleman of property, was born in March 1582 and educated at St John's College, Cambridge. He was ordained about 1605, and in 1610 he preached before King James I., whose favour he quickly gained by his love of compromise. The result was the rapid promotion of Williams in the church; he obtained several livings besides prebends at Hereford, Lincoln and Peterborough. In 1617 he became chaplain to the king, in 1619 dean of Salisbury, and in the following year dean of Westminster. On the fall of Bacon in 1621 Williams, who had meantime ingratiated himself with the duke of Buckingham, was appointed lord keeper, and was at the same time made bishop of Lincoln, retaining also the deanship of Westminster. As a political adviser of the king
WILLIAMS, JOHN (1796–1839), English Nonconformist missionary, was born at Tottenham near London on the 29th of June 1796. He was trained as an ironmonger, and acquired considerable experience in mechanical work. Having offered himself to the London Missionary Society, he was sent, after some training, in 1816 to Elmore, in the Society Islands, where he rapidly acquired a knowledge of the native language. After staying there for a short time, he finally settled at Rarotonga, which became his permanent headquarters. His success as a missionary here and elsewhere was remarkable. The people rapidly became Christianized and adopted many of the habits of civilization. Williams was fairly liberal for his age, and the results of his labours among the Pacific Islands were essentially beneficial. He travelled unceasingly among the various island groups, planting stations and settling native missionaries whom he himself had trained. From the Society Islands he visited the Hawaiian Islands before he discovered, and stayed for a considerable time on, the island of Rarotonga. Most of the inhabitants of the group were converted in a remarkably short time, and Williams's influence over them, as over the people of other groups, was very great. Besides establishing Christianity and civilization among them, he also, at their own request, helped them to draw up a code of laws for civil administration upon the basis of the new religion. While at Rarotonga he, with the help of the natives, built himself a 60-ft. ship, "The Messenger of Peace," within about four months; with this he returned to Raiaetea, and made voyages among other island groups, including Samoa and the neighbouring islands. Williams returned to England in 1834 (having previously visited New South Wales in 1821); and during his four years' stay at home he had the New Testament, which he had translated into Rarotongan, printed. Returning in 1838 to the Pacific, he visited the stations already established by him, as well as several fresh groups. He went as far west as the New Hebrides, and, while visiting Eromanga, one of the group, for the first time, was murdered by cannibal natives on the 20th of November 1839.

Williams, consistently counselled moderation and compromise between the unqualified assertion of the royal prerogative and the puritan views of popular liberties which were now coming to the front. He warned Buckingham and Prince Charles of the perils of their project for the Spanish marriage, and after their return from Madrid he encountered their resentment by opposing war with Spain. The lord keeper's counsel of moderation was less pleasing to Charles I. than it had been to his father. The new king was offended by Williams's advice to proceed with caution in dealing with the parliament, with the result that within a few months of Charles's accession the Great Seal was taken from his hands. In the question between the king and Parliament over the petition of right, Williams took the popular side in condemning arbitrary imprisonment by the sovereign. In the matter of ecclesiastical administration he similarly followed a middle course; but he had now to contend against the growing influence of Laud and the extreme high church party. A case was preferred against him in the Star Chamber of revealing state secrets, to which was added in 1635 a charge of subornation of perjury, of which he had undoubtedly been guilty and for which he was condemned in 1639 to pay a fine of £10,000, to be deprived of the two revenues which benefited the bishopric of Rochester at the king's pleasure. He was sent to the Tower. In 1639 he was again condemned by the Star Chamber for libelling Laud, a further heavy fine being imposed for this offence. In 1641 he recovered his liberty on the demand of the House of Lords, who maintained that as a peer he was entitled to be summoned to parliament. When the Long Parliament met, Williams was made chairman of a committee of inquiry into innovations in the church; and he was one of the bishops consulted by Charles as to whether he should veto the bill for the attainder of Strafford. In December 1641 the king, anxious to conciliate public opinion, appointed Williams archbishop of York. In the same month he was one of the twelve bishops impeached by the Commons for high treason and committed to the Tower. Released on an undertaking not to go to Yorkshire, a promise which he did not observe, the archbishop was enthroned in York Minster in June 1642. On the outbreak of the Civil War, after visiting Conway in the Royalist interest, he joined the king at Oxford; he then returned to Wales, and finding that Sir John Owen, acting on Charles's orders, had seized certain property in Conway Castle that had been deposited with the archbishop for safe-keeping, he sent over to the Parliamentary side and assisted in the recapture of Conway Castle in November 1646. Williams, who was a generous benefactor of St John's College, Cambridge, died on the 25th of March 1650.

WILLIAMS, ROGER (c. 1604–1684), founder of the colony of Rhode Island in America and pioneer of religious liberty, son of a merchant tailor, was born (probably) about 1604 in London. It seems reasonably certain that he was educated, under the patronage of Sir Edward Coke, at the Charter House and at Pembroke College, Cambridge, where he received his degree in 1626. According to tradition (probably untrue), he studied law under Sir Edward Coke; he formed a study of ecclesiastical history and was chaplain to Sir William Masham of Othes, in the parish of High Laver, Essex, but from conscientious scruples, in view of the condition of ecclesiastical affairs in England at the time, refused prebend. He soon decided to emigrate to New England, and, with his wife Mary, arrived at Boston early in February 1631. In April he became teacher of the church at Salem, Mass., as assistant to the Reverend Samuel Skelton. Owing to the opposition of the ecclesiastical authorities at Boston, with whose views his own were not in accord, he returned to Plymouth in the summer, and there remained for two years as assistant pastor. In August 1633 he again became assistant teacher at Salem, and in the following year succeeded Skelton as teacher. Here he incurred the hostility of the authorities of the Massachusetts Bay Colony by asserting, among other things, that the civil power of a state could properly have no jurisdiction over the consciences of men, that the King's patent conveyed no just title to the land of the colonists, which should be bought from its rightful owners, the Indians, and that a magistrate should not tender an oath to an unregenerate man, an opinion he maintained in reality; for the expression of these opinions he was formally tried in July 1635 by the Massachusetts General Court, and at the next meeting of the General Court in October, he not having taken advantage of the opportunity given to him to recant, a sentence of banishment was passed upon him, and he was ordered to leave the jurisdiction of Massachusetts within six weeks. The time was subsequently extended, conditionally, but in January 1636 an attempt was made to seize him and transport him to England, and he, forewarned, escaped from his home at Salem and proceeded alone to Manton's Neck on the east bank of the Seekonk river. At the instance of the authorities at Plymouth, within whose jurisdiction Manton's Neck was included, Williams, with four companions, who had joined him, founded, in June 1636 the first settlement in Rhode Island, to which, in remembrance of "God's merciful providence to him in his distress," he gave the name Providence. He immediately established friendly relations with the Indians in the vicinity, whose language he had learned, and, in accordance with his principles, bought the land upon which he had settled from the sachems Canonicus (c. 1657–1647) and Miantonomo, of the Narragansetts, in 1639, and stayed with the Indians, getting their implicit confidence in him, enabled him in 1636, soon after arriving at Providence, to induce the Narragansetts to ally themselves with the Massachusetts colonists at the time of the Pequot War, and thus to render a most effective service to those who had driven him from their community. Williams and his companions founded their new settlement upon the basis of complete religious toleration, with a view to its becoming "a shelter for persons distressed for conscience" (see RHODE ISLAND). Many settlers came from Massachusetts and elsewhere.
among others some Anabaptists, by one of whom in 1630 Williams was baptized, he baptizing others in turn and thus establishing what has been considered the first Baptist church in America. Williams, however, maintained his connexion with this church for only three or four months, and then became what was known as a "Seeker," or Independent, though he continued to preach. In June 1643 he went to England, and there in the following year obtained a charter for Providence, Newport and Portsmouth, under the title "The Providence Plantations in the Narragansett Bay." He returned to Providence in the autumn of 1644, and soon afterwards was instrumental in averting an attack by the Narragansets upon the United Colonies of New England by the removal of the Old Colony from Providence to a place now known as Wickford, R.I. He was at various times a member of the general assembly of the colony, acted as deputy president for a short time in 1649, was president, or governor, from September 1654 to May 1657, and was an assistant in 1664, 1667 and 1670. In 1651, with John Clarke (1609-1676), he went to England to secure the annulment of a commission which had been obtained by William Coddington for the government of Rhode Island (Newport and Portsmouth) and Connecticut, and the issue of a new and more explicit charter, and the following year succeeded in having the Coddington commission vacated. He returned to the colony the following summer, having enjoyed the friendship of Cromwell, Milton and other prominent Puritans; but Clarke remained in England and in 1663 obtained from Charles II. a new charter for "Rhode Island and Providence Plantations." Williams died at Providence in March or April 1684; the exact date is unknown.

Though headstrong, opinionative and rigid in his theological views, he was uniformly tolerant, and he occupies a high place among those who have striven for complete liberty of conscience. He was the foremost exponent in America of the theory of the absolute freedom of the individual in matters of religion; and Rhode Island, of which he was pre-eminent the founder, was the first colony consistently to apply this principle in practice.

Williams was a vigorous controversialist, and published, chiefly during his two visits to England, besides A Key into the Language of the Indians of America (written at sea on his first voyage to England (1643); reprinted in vol. i. of the Collections of the Rhode Island Historical Society (1827), and in series i. vol. iii. of the Massachusetts Historical Society Collections); Mr Cotton's Letter Examined and Answered (1646); and the first edition of A Vindication from the Cause of Conscience (1644); Queries of Highest Consideration (1645); The Bloody Tenent yet more Bloody (1652); The Hitting Ministry none of Christ's (1652); Experiments of Spiritual Life and Health (1655); and A Hymn to the Holy Spirit (1676).

His writings have been republished in the Publications of the Narragansett Club (6 vols., Providence, 1866-1874), the last volume containing his extant letters, written between 1632 and 1684. The best biographies are those by Oscar Straus (New York, 1894) and E. J. Carpenter (ibid. 1910). Also see J. D. Knowles, Memoir of Roger Williams (Boston, 1834), and Elton, Life of Roger Williams (London, 1852; Providence, 1853); New England Hist. and Gen. Register, July and October 1889, and January 1890; and M. C. Tyler, History of American Literature, 1607-1705 (New York, 1878). For the best apology for the expulsion from Massachusetts, see Henry M. Dexter's As to Roger Williams and his "Banishment" from the Massachusetts Plantation (Boston, 1876), an unsuccessful attempt to prevent Massachusetts from revoking the order of banishment.

WILLIAMS, ROWLAND (1817-1870), English divine and scholar, was born at Halkyn, Flint, the son of Rowland Williams (d. 1834), canon of St Asaph, and educated at Eton and Cambridge. He was elected fellow of King's College, Cambridge, in 1839, and took orders in 1842. During the next few years he acted as tutor at Eton, and chaplain of St Asaph and Bangor. In 1850 he became vice-principal and Hebrew master at St David's College, Lampeter, where he introduced much-needed educational and financial reforms. He was appointed select preacher of Cambridge University in 1854, and preached a sermon on inspiration, afterwards published in his Rational Goodness after the Mind of Christ and the Written Voices of the Church (London, 1853). He was charged with heresy, and Alfred Ollivant (1798-1883), bishop of Llandaff, required him to resign his chaplaincy, but he remained at the college in spite of these difficulties. His views were further defined in Christianity and Hinduism (Cambridge, 1856), an expansion of the Muir prize essay which he had won in 1848. He became vicar in 1858 of Brondbyeholm with Rossehav and Alvedstorff in Wilshire. As a result of his favourable review of Bunyan's "Biblical Review" contributed to Essays and Reviews (1860) he was prosecuted for heterodoxy. An unfavourable judgment was given by the Canterbury Court of Arches in 1862, but reversed by the Privy Council in 1864. Williams died on the 18th of January 1870.

Besides the above works his most important production was a translation of the Hebrew Prophets with commentary (pt. i. 1866; pt. ii. edited by Mrs Williams 1871; pt. iii. is never written). See Life and Letters, edited by Mrs Williams (2 vols., 1874); and T. K. Cheyne, Founders of Old Testament Criticism (1893).

WILLIAMS, SIR WILLIAM PENWICK, Bart. (1800-1883), British general, second son of Commissary-General Thomas Williams, barrack-master at Halifax, Nova Scotia, was born at return from Nova Scotia, on the 4th of December 1800. He entered the Royal Artillery as second lieutenant in 1825. His services were lent to Turkey in 1841, and he was employed as a captain in the arsenal at Constantinople. He was British commissioner in the conferences preceding the treaty of Erzerum in 1847, and again in the settlement of the Turko-Persian boundary in 1848 (brevet majority and lieutenant-colonel and C.B.). Promoted colonel, he was British commissioner with the Turkish army in Anatolia in the Russian War of 1854-56, and, having been made a ferris (lieutenant-general) and a pasha, he practically commanded the Turks during the heroic defense of Kars, repulsing the Russian attack and severely defeating the Russian general Muraviev in the battle of Kars on 29th September 1855. Cold, cholera, famine and hopelessness of succour from without, however, compelled Williams to make an honourable capitulation on the 28th of November following. A baronetcy with pension for life, the K.C.B., the grand cross of the Legion of Honour and of the Turkish Medjidie, the freedom of the City of London with a sword of honour, and the honorary degree of D.C.L. of Oxford University, were the distinctions conferred upon him for his valour. Promoted major-general in November 1855 on his return from captivity in Russia, he held the Woolwich command, and represented the United Kingdom at the Paris exhibition in 1855. He was made G.C.B. in 1857, and Constable of the Tower of London in 1881. He died in London on the 26th of July 1883.

WILLIAMSBURG, a city and the county-seat of James City county, Virginia, U.S.A., on a peninsula between the York and James rivers, 48 m. by rail E.S.E. of Richmond. Pop. (1900) 20,044; (1910) 2714. Williamsburg is served by the Chesapeake & Ohio railway. It is the seat of the Williamsburg Female Institute (Presbyterian), and of the College of Williams and Mary, chartered by the Crown in 1693 and the second oldest college in the United States. Besides the main building and the president's house, the College of Williams and Mary has a science hall, a gymnasium, a library building, an infirmary and dormitories; in front of the main building is a statue by Richard Hayward of Norborne Berkeley, Lord Botetourt (1717-1770), the most popular royal governor of Virginia. The college offers a classical course and a scientific course, two-thirds of the work in each being prescribed, and in connexion with the local department of the Matthew Whaley Model and Practice School. In 1909 there were 22 instructors and 228 students in the college, 6 instructors and 140 pupils in the model school, and 20,000 volumes, many of them rare, in the library. Since 1892 the college has published the Williams and Mary College Quarterly, an historical magazine.

Here in December 1776 was established the Phi Beta Kappa Society, the first American college "Greek Letter" Society, now an inter-collegiate honorary fraternity. The college suffered heavy losses during the War of Independence and in the Civil War. In June 1781 Lord Cornwallis made the president's house his headquarters, and the institution was closed for a few
months of that year. It was closed in 1861 because of the Civil War, and the main building was occupied in turn by Confederate troops and by Federal troops until some of the latter burned it in 1862. After it was reoccupied in 1866, the college was closed again from 1891 to 1888 because of the low state of its finances. In 1888 it was reorganized under an act of the state legislature which provided for the addition of a normal course and an annual appropriation towards its maintenance. The last day of Congress indemnifying it some measure for its loss during the Civil War; and in 1906 its endowment was increased to more than $500,000 and it was made a state college, governed by a board (appointed by the governor) and receiving $55,000 annually from the state. Peyton Randolph, Edmund Randolph, Thomas Jefferson, James Monroe, John Tyler, Chief Justice John Marshall and General Winfield Scott were graduates of the college.

Bruton Parish Church, completed in 1717 and enlarged in 1752 is the second church of a parish dating from 1674. It contains a Bible given by King Edward VII., a lectern given by President Roosevelt, and some old relics. The church itself has been restored (1905-1907) so far as practicable to its original form and appearance. The Association for the Preservation of Virginia Antiquities has preserved a powder magazine, erected in 1714, from which the last 17th governor of Virginia, Lord Dunmore, removed the powder on the day after the encounter at Lexington, Massachusetts, and thus occasioned the first armed uprising of the Virginia patriots. The County and City Court House was erected in 1769. The Eastern State Hospital for the Insane was opened here in 1773, but its original building was burned in 1885. Among several colonial residences are the George Wythe House, which was the headquarters of Washington during the siege of Yorktown in 1781, and the Peyton Randolph House.

The principal industries are the manufacture of men's winter underwear, rubber and ice, and the shipment of lumber and farm and garden produce.

Williamsburg, originally named Middle Plantation from its position midway between the York and James rivers, was founded in 1632. It was immediately walled in and for several years it served as a refuge from Indian attacks. On the 3rd of August 1676 Nathaniel Bacon held here his "rebels" assembly of the leading men of the province, and in January 1677 two of the "rebels" were hanged here. In 1685 Middle Plantation was made the provincial capital; and in 1699 the present name was adopted in honour of William III. Williamsburg was chartered as a city in 1722. In 1756 the Virginia Gazette, the oldest newspaper in the South, was established here. In the capitol here Patrick Henry, on the 30th of May 1765, presented his historic resolutions and made his famous speech against the Stamp Act. On the 15th of May 1776, the Virginia Convention in session here passed resolutions urging the Continental Congress to declare for Independence. In 1779 Richmond became the seat of the state government, and in 1832 fire destroyed the last of the old capitol at Williamsburg with the exception of the foundations, which since 1867 have been cared for by the Association for the Preservation of Virginia Antiquities.

In the Peninsula campaign of the Civil War the Battle of Williamsburg was fought on the 5th of May 1862 on the south-eastern outskirts of the city. The Confederate army under General J. E. Johnston was retreating from Yorktown toward Richmond and a part of it under General James Longstreet waited here to check the pursuit of the advance portion of the Union army under General E. V. Sumner. A Union division under General J. D. Hooker began a spirited attack at 7.30 A.M., but they failed from lack of co-operation to rout the Confederates and a fight the latter continued their retreat. The Union loss in killed, wounded and missing was 2,228; the Confederate about 1,560.

See L. G. Tyler, Williamsburg, the Old Colonial Capital (Richmond, 1917), and his "Williamburg, the Ancient Capital," in L. P. Powell's Historic Towns of the Southern States (New York, 1900).

WILLIAMSON, ALEXANDER WILLIAM (1824-1864), English chemist, was born at Wandsworth, London, on the 1st of May 1824. After working under Liebig and Bunsen from 1840 and 1843-1855, he spent three years in Paris studying the higher mathematics under Comte. In 1849 he was appointed professor of practical chemistry at University College, London, and from 1855 until his retirement in 1887 he also held the professorship of chemistry. He had the credit of being the first to explain the process of etherification and to elucidate the formation of ether by the interaction of sulphuric acid and alcohol. Ether and alcohol he regarded as substances analogous to and built up on the same type as water, and he further introduced the water-type as a widely applicable basis for the classification of chemical compounds. The method of stating the rational constitution of bodies by comparison with water he believed capable of wide extension, and that on this type, he thought, would suffice for all inorganic compounds, as well as for the best-known organic ones, the formula of water being taken in certain cases as doubled or tripled. So far back as 1850 he also suggested a view which, in a modified form, is of fundamental importance in the modern theory of ionic dissociation, for, in a paper on the theory of the formation of ether, he urged that in an aggregate of molecules of any compound there is an exchange constantly going on between the elements which are contained in it; for instance, in hydrochloric acid each atom of hydrogen does not remain quietly in juxtaposition with the atom of chlorine with which it is united, but changes places with other atoms of hydrogen.

A somewhat similar hypothesis was put forward by R. E. Clausius about the same time. For his work on etherification Williamson in 1862 received a Royal medal from the Royal Society, of which he became a fellow in 1855, and which he served as foreign secretary from 1873 to 1889. He was twice president of the London Chemical Society, in 1863-1865, and again in 1865-1871. His death occurred on the 6th of May 1894, at Hindhead, Surrey, England.

WILLIAMSON, SIR JOSEPH (1653-1701). English politician, was born at Bridkirk, near Cockerham, his father, Joseph Williamson, being vicar of this place. He was educated at St Bees, at Westminster school and at Queen's College, Oxford, of which he became a fellow, and in 1660 he entered the service of the secretary of state, Sir Edward Nicholas, retaining his position under the succeeding secretary, Sir Henry Bennet, afterwards earl of Arlington. For his connexion with the foundation of the London Gazette in 1665 see NEWSPAPERS. He entered parliament in 1669, and in 1672 was made one of the clerks of the council and a knight. In 1673 and 1674 he represented his country at the congress of Cologne, and in the latter year he became secretary of state, having practically purchased this position from Arlington for £6000, a sum which he required from his successor when he left office in 1679. Just before his removal he had been arrested on a charge of sharing in the popish plots, but he had been at once released by order of Charles II. After a period of comparative inactivity Sir Joseph represented England at the congress of Nijmegen in 1667, and in 1668 he signed the first treaty for the partition of the Spanish monarchy. He died at Cobham, Kent, on the 3rd of October 1701. Williamson was the second president of the Royal Society, but his main interests, after politics, were rather in antiquarian than in scientific matters. Taking advantage of the many opportunities of making money which his official position gave him, he became very rich. He left £6000 and his library to Queen's College, Oxford; £5000 to found a school at Rochester; and £2000 to Thetford.

A great number of Williamson's letters, despatches, memoranda, &c., are among the English state papers.

WILLIAMSON, WILLIAM CRAWFORD (1816-1895), English naturalist, was born at Scarborough on the 24th of November 1816. His father, John Williamson, after beginning life as a gardener, became a well-known local naturalist, who, in conjunction with William Bean, first explored the rich fossiliferous beds of the Yorkshire coast. He was for many years curator of the Scarborough natural history museum, and the younger Williamson was thus from the first brought up among scientific surroundings and in association with scientific people. William Crawford Williamson, the "father of English geology," lived for twenty years in the Williamson family. Williamson's maternal grandfather was a lapidary, and from him he learnt the art of cutting stones, an accomplishment which he found of great use.
in later years, when he undertook his work on the structure of fossil plants. Williamson very early made a beginning as an original contributor to science. When little more than sixteen he published a paper on the rare birds of Yorkshire, and a little later (1834) presented to the Geological Society of London his first memoir on the Mesozoic Palaeotropical Tertiary geology, and he was assisted Lindley and Hutton in the preparation of their well-known Flora of Great Britain. On entering the medical profession he still found time to carry on his scientific work during his student days, and for three years acted as curator of the Natural History Society's museum at Manchester. After completing his medical studies at University College, London, in 1841, he returned to Manchester to practise his profession, in which he met with much success. When Owens College at Manchester was founded in 1851 he became professor of natural history there, was appointed a professor of teaching geology, zoology and botany. A very necessary division of labour took place as additional professors were appointed, but he retained the chair of botany down to 1892. Shortly afterwards he removed to Clapham, where he died on the 23rd of June 1895. Williamson's teaching work was not confined to his university classes, for he was also a successful popular lecturer, especially for the Gilchrist Trustees. His scientific work, pursued with remarkable energy throughout life in the midst of official and professional duties, had a wide scope. In geology, his early work on the zones of distribution of fossils and on the part played by microscopic organisms in the formation of marine deposits (1845), was of fundamental importance. In zoology, his investigations of the development of the teeth and bones of fishes (1842–1851), and on recent Foraminifera, a group on which he wrote a monograph for the Ray Society in 1857, were of less value. In botany, in addition to a remarkable memoir on the minute structure of Voluta (1852), his work on the structure of fossil plants established British palaeobotany on a scientific basis; on the ground of these researches Williamson may rank with A. T. Brongniart as one of the founders of this branch of science. His contributions to fossil botany began in the earliest days of his career, and he returned to the subject from time to time during the period of his geological and zoological activity. His investigation of the Mesozoic cycadoid fossil Zamia (now Williamsia) gigas was the chief palaeobotanical work of this intermediate period. His long course of researches on the structure of Carboniferous plants belongs mainly to the latter part of his life, and his results are chiefly, though not wholly, embodied in a series of nineteen memoirs, ranging in date from 1871 to 1875, in the Proceedings of the Royal Society of London (S. of O.), and in the Philosophical Transactions of the Royal Society. The works in this series (notably the monograph on Stigmatisoideae, Palaeontographical Society, 1886, published elsewhere, Williamson elucidated the structure of every group of Palaeozoic vascular plants. Among the chief results of his researches may be mentioned the discovery of plants intermediate between ferns and cycads, the description of the true structure of the fructification in the extinct cryptogamic family Sphenophyllaceae, and the demonstration of the cryptogamic nature of the dominant Palaeozoic orders Calamariae, Lepidodendreae and Sigillariae, plants which on account of the growth of their stem and roots in a vertical plane and the absence of leaves were regarded as phanerogams by Brongniart and his followers. After a long controversy the truth of Williamson's views has been fully established, and it is now known that the mode of growth, characteristic in present times, of dicotyledons and gymnosperms prevailed in Palaeozoic ages in every family of vascular cryptogams. Thus, as Count Solms-Laubach has pointed out, palaeobotany for the first time spoke the decisive word in an important question of general botany. Williamson's work in fossil botany was scarcely appreciated at the time as it deserved, for its great merits were somewhat obscured by the author's want of familiarity with the modern technicalities of the science. Since, however, the subject has been seriously taken up by botanists of a newer school, the soundness of the foundation he laid has become fully recognized. It may be added that he was a skilled draughtsman, illustrating all his works by his own drawings, and practising water-colour painting as his favourite recreation.

A full account of Williamson's career will be found in his autobiography, entitled Reminiscences of a Yorkshire Naturalist, edited by his wife (London, 1869). Among obituary notices may be mentioned that by Count Solms-Laubach, Nature (5th September 1893), and one by D. H. Scott in Proc. R. Sc. vol. ix. (1897).

WILLIAMSPORT, a city and the county-seat of Lycoming county, Pennsylvania, U.S.A., on the north bank of the west branch of the Susquehanna river, about 70 m. N. by W. of Harrisburg. Pop. (1890) 27,132; (1900) 28,757, of whom 1144 were negroes and 2228 were foreign-born, including 1689 Germans; (1910 census), 31,860. Area, about 7 sq. m. Williamson is served by the New York Central & Hudson River, the Penn- sylvania, the Susquehanna & W. New York; and the Philadelphia & Reading railways, and by electric lines connecting with the neighbouring towns of Montoursville (pop. in 1900, 1665), South Williamson (pop. in 1900, 3328), on the S. bank of the river, and Du Boistown (pop. in 1900, 650). The city has an attractive site, on a high plain, nearly surrounded by hills. It has five parks, Brandon (44 acres) within the city limits, and Vallamont, Starr Island, Sylvan Dell and Nippono in its suburbs. Williamson is the seat of Williamson Dickinson Seminary (Methodist Episcopal, co-educational, 1848), a secondary school. Among the principal buildings are the county court house, the city hall, the United States Government building, the Scottish Rite Cathedral, the Masonic Temple, a Y.M.C.A. building, and the James V. Brown Memorial Library (1907). In the city are a Boys' Industrial Home (1898), a Girls' Training School (1895), a Florence Crittendon Home (1893), a Home for Aged Coloured Women (1898), a Home for the Friendless (1872), and Williamson Hospital (1873). There are practically no tenement houses. The value of factory products in 1905 was $1,738,473, 26.7% more than in 1900. Williamson has the largest lumber market in Pennsylvania, lumbars are the most important of its manufactures, and Williamson was styled the "sawdust city." The decreasing importance of the industry is due to the virtual extinction of standing timber in the neighbourhood. Lumber and timber products were valued at $1,310,365 in 1905, and lumber and planing mill products at $796,067. Among other manufactures are silk and silk goods, valued at $1,191,273 in 1905; foundry and machine shop products, $1,164,737; rubber and leather boots and shoes, furniture, &c. The city has a large trade with the surrounding country. The water supply is derived from mound reservoirs on the S. side of the river, and at the back of the city. The water was taken from the river; in which year Williamson was founded and became the county-seat, after a bitter contest with Jaysburg, which was then a village of only some half a dozen houses and which subsequently ceased to exist. Williamson was incorporated as a borough in 1866, and was chartered as a city in 1866.

WILLIAMSTOWN, a town of Bourke county, Victoria, Australia, 9 m. by rail S.W. of Melbourne. Pop. (1901) 14,683. Shipping is the chief business of the place, there being commodious piers, breakwater, also provision for the repair of vessels, patent slips and shipbuilding yards, with a dockyard. The town, which was established in 1795, in which year Williamson was founded and became the county-seat, after a bitter contest with Jaysburg, which was then a village of only some half a dozen houses and which subsequently ceased to exist. Williamson was incorporated as a borough in 1866, and was chartered as a city in 1866.

WILLIAMSTOWN, a township of Berkshire county, Massa- chusetts, U.S.A., on the Hoosick and Green rivers, in the N.W. corner of the state, and about 20 m. N. of Pittsfield. Pop. (1890) 4217; (1900) 5013, of whom 929 were foreign-born and 138 were negroes; (1910 census), 3708. Williamson is served by the Boston & Maine railway and by an interurban electric line to North Adams. It covers an area of about 49 sq. m. and contains five villages. Williamson, the principal village, is a pleasant residential centre on the Green river; it is sur- rounded by beautiful scenery and its streets are shaded by some fine old trees. Mission Park (10 acres) here is adorned by native
and foreign shrubs and by maples, elms, pines and arbor vitae, and "Haystack Monument" in this park marks the place where Samuel John Mills (1753-1818), in 1806, held the prayer meeting which was the forerunner of the American foreign missionary movement. Williams-town village is the seat of Williams College, chartered in 1793 as a successor to a "free school" in Williamstown (chartered in 1783 and endowed by a bequest of Colonel Ephraim Williams). Besides recreation and residence halls, it has the Lawrence Hall Library (1846), containing (1016) 65,000 volumes, the Thompson Memorial Chapel (1904), the Lasell Gymnasium (1886), an infirmary (1853), the Hopkins Observatory (1857) and the Field Memorial Observatory (1882), the Thompson Chemical Laboratory (1882), the Thompson Biological Laboratory (1893) and the Thompson Physical Laboratory (1893). In 1910 the college had 55 instructors and 537 students. The fourth president of the college was Mark Hopkins (q.v.), and one of its most distinguished alumni was James A. Garfield, president of the United States, whose son, Harry Augustus Garfield (b. 1861), became president of the college in 1908.

The principal manufactures of the township are cotton and woolen goods (especially corduroy), and market gardening is an important industry. The limits of the town, originally called West Hoosac, were determined by a committee of the General Court of Massachusetts in 1740, and two or three years later the village was laid out. Two of the lots were immediately purchased by Captain Ephraim Williams (1715-1755), who was at the time commander of Fort Massachusetts in the vicinity; several other lots were bought by soldiers under him; and in 1753 the proprietors organized a township government. Williams was killed in the battle of Lake George on the 8th of September 1755, but while in camp in Albany, New York, a few days before the battle, he drew a will containing a bequest for a free school at West Hoosac on condition that the township when incorporated should be called Williams-town. The township was incorporated with that name in 1765.

See A. L. Perry, Origins in Williams-town (New York, 1891; 3rd ed. 1900); and Williamstown and Williams College (Norwood, Mass., 1899).

WILLIAMS-WYNNE, SIR WATKIN, Bart. (1562-1749), Welsh politician, was the eldest son and heir of Sir William Williams, Bart., of Llanfora near Oswestry; his mother, Jane Thelwall, was descended from the anti-Barefoot family of John Wynn of Gwydir, Carnarvonshire. Educated at Jesus College, Oxford, Williams succeeded to Wynn's near Ruabon and the estates of the Wynn on the death of a later Sir John Wynn in 1719, and took the name of Williams-Wynn. He was member of parliament for Denbighshire from 1716 to 1741, and was prominent among the opponents of Sir Robert Walpole; as a leading and influential Jacobite he was in communication with the supporters of Prince Charles Edward before the rising of 1745, but his definite offer of help did not reach the prince until the retreat to Scotland had begun. He died on the 26th of September 1749. His first wife, Ann Vaughan (d. 1748), was the heroine of extensive estates in Montgomeryshire which still belong to the family. His son and heir, Sir Watkin Williams-Wynn, Bart. (1749-1789), was the father of another Sir Watkin (1772-1842), the 7th baronet. Two other sons attained some measure of distinction: Charles (1775-1850), a prominent Tory politician, and Sir Henry (1783-1869), a diplomatist. A daughter, Frances Williams-Wynn (d. 1857), was the author of "Diaries of a Lady of Quality, 1767-1844," which were edited with notes by Abraham Hayward in 1864.

See Askew Roberts, Wynn, and the Wynn (Oswestry, 1874).

WILLIBRORD (or Willibrord), St (d. 739), English missionary, "the apostle of the Frisians," was born about 657. His father, Wiligis, an Angle or, as Alcuin styles him, a Saxon, of Northumbria, withdrew from the world and constructed for himself a little oratory dedicated to St Andrew. The king and nobles of the district endowed him with estates till he was at last able to build a church, over which Alcuin afterwards ruled. Willibrord, almost as soon as he was weaned, was sent to be brought up at Ripon, where he must doubtless have come under the influence of Wilfrid. About the age of twenty the desire of increasing his stock of knowledge (c. 675) drew him to Ireland, which had so long been the headquarters of learning in western Europe. Here he stayed for twelve years, enjoying the society of Egbert and Winchbret, was converted to the Church, and to South Germany received by his commission to missionary work among the North-German tribes. In his thirty-third year (c. 690) he started with twelve companions for the mouth of the Rhine. These districts were then occupied by the Frisians under their king, Rathbod, who gave allegiance to Pippin of Herstal. Pippin befriended him and sent him to Rome, where he was consecrated archbishop (with the name Clemens) by Pope Sergius on St Cecilia's Day 696. He tells us that when he returned to Frisia his see was fixed in Ultrasound (Utrecht). He spent several years in foundling churches and evangelizing, till his success tempted him to pass into other districts. From Denmark he carried away thirty boys to be brought up among the Franks. On his return he was wrecked on the holy island of Fosite (Heligoland), where his disregard of the pagan superstition nearly cost him his life. When Pippin died, Willibrord found a supporter in his son Charles Martel. He was assisted for three years in his missionary work by St Boniface (719-722), who, however, was not willing to become his successor. He was still living when Bede wrote in 731. A passage in one of Bede's letters to Stephen III. speaks of his preaching to the Frisians for fifty years, apparently reckoning from the time of his consecration. This would fix the date of his death in 728; and, as Alcuin tells us he was eighty-one years old when he died, it may be inferred that he was born in 657—a theory on which all the dates given above are based, though it must be added that they are substantially confirmed by the incidental notices of Bede. The day of his death was the 6th of November, and his body was buried in the monastery of Echternach, near Trier, which he had himself founded. Even in Alcuin's time miracles were reported to be still wrought at his tomb.

The chief authorities for Willibrord's life are Alcuin's Vita Willibrordi, both in prose and verse, and Bede's Hist. Eccl. v. cc. 9-11. See also Edidius's Vita Willfridi, and J. Mabillon, Annales ordinis sancti Benedicti, lib. xviii.

WILLIMANTIC, a city of Windham county, Connecticut, U.S.A., in the township of Windham, at the junction of the Willimantic and Natchaug rivers to form the Shetucket, in the E. part of the state, about 16 m. N.W. of Norwich. Pop. (1890) 8463; (1900) 9357, of whom 2491 were foreign-born; (1910) census, 11,230. It is served by the New York, New Haven & Hartford and the Central Vermont railways, and by electric railway to Baltic, N.W., and Northampton. It is the seat of a State Normal Training School, and has a public library and Dunham Hall Library (1878). The Willimantic river provides great power-water, and there are various manufactures. The total value of the factory product in 1905 was $4,002,447. The township of Windham was incorporated in 1692. Willimantic was settled in 1823, incorporated as a borough in 1833, and chartered as a city in 1893. The name is from an Indian word meaning "good look-out" or "good cedar swamps."

WILLIS, NATHANIEL PARKER (1806-1867), American author, was the eldest son of Nathaniel Willis, described as a "Puritan of considerable distinction," who arrived in New England about 1630 and settled in Cambridge, Massachusetts. Nathaniel Parker was the eldest son and second child of Nathaniel Willis, a newspaper proprietor in Boston, and was born in Portland, Maine, on the 26th of January 1806. After attending Boston grammar school and the academy at Andover, he entered Yale College in October 1823. Although he did not specially distinguish himself as a student, university life had considerable influence in the development of his character, and furnished him much of his literary material. Immediately after leaving Yale he published in 1827 a volume of poetical Sketches, which attracted some attention, although the critics found in his verses more to blame than to praise. It was followed by Fugitive Poetry (1829) and another volume of verse (1831). He also

1 He had been consecrated bishop, also by Sergius, on a previous visit in 692.

Williams-Wynn—Williams, N. P.
contributed frequently to magazines and periodicals. In 1829 he started the American Monthly Magazine, which was continued from April of that year to August 1831, but failed to achieve success. On its discontinuance he went to Europe as foreign editor and correspondent of the New York Mirror. To this journal he contributed a series of letters, which, under the title Penkillings by the Way, were published in London in 1835 (3 vols.; Philadelphia, 1836, 2 vols.; and first complete edition, New York, 1841). Their vivid and rapid sketches of scenes and modes of life in the old world at once gained them a wide popularity; but he was censured by some critics for indiscernment in reporting conversations in private gatherings. Notwithstanding, however, his letters brought him new appointments and footholds which were his besetting weaknesses as a man as well as an author, the grace, ease and artistic finish of his style won general recognition. His "Slingsby Papers," a series of magazine articles descriptive of American life and adventure, republished in 1836 under the title Inklings of Adventure, were as successful in England as were his Penkillings by the Way in America. He also published while in England Melodies and other Poems (London, 1835; New York, 1837), which was introduced by a preface by Barry Cornwall (Procter). After his marriage to Mary Stace, daughter of Colonel William Stace of Woodville, Wiltshire, he was apprenticed to his friend Simon Willson, and settled at a small estate on Oswego Creek, just above its junction with the Susquehanna. Here he lived off and on from 1837 to 1842, and wrote Letters from under a Bridge (London, 1840; first complete edition, New York, 1844), the most charming of all his works. During a short visit to England in 1839-1840 he published Two Ways of Dying for a Husband. Returning to New York, he established, along with George P. Morris, a newspaper entitled the Evening Mirror. On the death of his wife in 1845 he again visited England. Returning to America in the spring of 1846, he married Cornelia Grimmel, and established the New York Press, afterwards named the Home Journal. In 1845 he published Dashes at Life with a Free Pencil, in 1846 a collected edition of his Prose and Poetical Works, in 1849 Rural Letters, and in 1850 Life Here and There. In that year he settled at Idlewild on the Hudson river, and on account of failing health spent the remainder of his life chiefly in retirement. Among his later works were Hurry-Graphs (1851), Outdoors at Idlewild (1854), Ragbag (1855), Paul Fane (1856), and the Consoladent (1859), but he had survived his great reputation. He died on the 20th of January 1867, and was buried in Mount Auburn, Boston.

The best edition of his verse writings is The Poems, Sacred, Passionate and Humorous, of N. P. Willis (New York, 1868); 13 volumes of his prose, Complete Prose Works, were published at New York in 1879. A posthumous edition of his Poems, first edited by Henry A. Beers (New York, 1885). His Life, by Henry A. Beers, appeared in the series of "American Men of Letters" the same year. See also E. F. Whipple, Essays and Reviews (vol. i., 1848); M. A. de Wolfe Howe, American Bookmen (New York, 1898).

WILLIS, THOMAS (1621-1673), English anatomist and physician, was born at Great Bedwin, Wiltshire, on the 27th of January 1621. He studied at Christ Church, Oxford; and when that city was garrisoned for the king he bore arms for the Royalists. He took the degree of bachelor of medicine in 1646, and applied himself to the practice of his profession. In 1649, shortly after the Restoration, he became Sociellian professor of natural philosophy in place of Dr Joshua Cross, who was ejected, and the same year he took the degree of doctor of physic. In 1664 he discovered the medicinal spring at Astrop, near Brackley in Northamptonshire. He was one of the first members of the Royal Society, and was elected an honorary fellow of the Royal College of Physicians in 1664. In 1666, after the fire of London, he took a house in St Martin's Lane, and there rapidly acquired an extensive practice, his reputation and skill marking him out as one of the first physicians of his time. He died in St Martin's Lane on the 11th of November 1675 and was buried in Westminster Abbey.

Wills was admired for his piety and charity, for his deep insight into natural and experimental philosophy, anatomy and chemistry, and for the elegance and purity of his Latin style. Among his writings were Cerberi anatoe nervorumque descriptio et usus (1664), in which he described what is still known, in the anatomy of the brain, as the circle of Willis, and Pharmacire rationalis (1674), in which he characterized diabetes mellitus. He wrote in English A Discovery of a Curious and Easy Method for Teaching those that are Weak from the Infection of the Plague, and for Curing such as are Infected. His Latin works were printed in two vols. at Geneva in 1676, and at Amsterdam in 1682. Browne Willis (1685-1760), the antiquarian, author of the three volumes of Surveys of the cathedrals of England, was his grandson.

WILLIS, JAMES TIBBITS (1800-1863), English line engraver, was born at Bristnall's End, Handsworth, near Birmingham, on the 19th of September 1800. At the age of fourteen he was apprenticed to William Radcliffe, a Birmingham engraver, and in 1823 he went to London and was employed for three years by Charles Heath. He was afterwards engaged upon the plates of Brockden's Passages of the Alps and Turner's England and Wales. He engraved after Chalon, Leitch, Stanfield, Landseer, Eastlake, Creswick and Ansell, and especially after Turner, from whose "Alnwick Castle by Moonlight," "The Old Temeraire," "Mercury and Argus," "Ancient Rome," and the subjects of the Rivers of France, he executed many admirable plates. He was elected an associate engraver of the Royal Academy in 1843. He died on the 12th of March 1863.

WILLIBO (or WILLOGHY), HENRY (1575-1606), the supposed author of a poem called Willibob his Avisa, which derives interest from its possible connexion with Shakespeare's personal history. Henry Williboughy was the second son of a Wiltshire gentleman of the same name, and matriculated from St John's College, Oxford, in December 1591, at the age of sixteen. He is probably identical with the Henry Williboughy who graduated B.A. from Exeter College early in 1595, and after the 3rd of June 1596, when to a note of this date the poem Hadrian Dorrell added an "Apologie" in defence of his friend the author "now of late gone to God," and another poem in praise of chastity written by Henry's brother, Thomas Williboughy. Willibob his Avisa was licensed for the press on the 3rd of September 1594, four months after the entry of Shakespeare's Rape of Lucrece, and printed by John Windet. It is preceded by two commendatory poems, the second of which, signed "Contraria Contrariis; Vigilantius; Dormitana," contains the earliest known printed allusion to Shakespeare by name:

"Yet Tarquuyne pluckt his glittering grape, And Shakespeare paints poor Lucrece rape."

In the poem itself, Avisa, whose name is explained in Dorrell's "Epistle to the Reader" as Avisus Uxor Invidiosa Semper Amanda, takes up the parable alternately with her suitors, one of whom is introduced to the reader in a prose interlude signed by the author H. W., as Henrico Willobegho Italo Hispanisalis. This passage contains a reference which may fairly be applied to the sonnets of Shakespeare. It runs:

"H. W. being suddenly infect with the contagion of a fantastical fit, did at the first sight of Avisa bewray the secret of his disease unto his familiar friend W. S. who not long before had tried the curtesy of the like passion, and was now newly recover'd...he and the said poet, set to a happier end for this new actor, then it did for the old player."

Then follows a dialogue between H. W. and W. S., in which W. S., "the old player," a phrase susceptible of a double sense, gives somewhat commonplace advice to the disconsolate woer.

Dorrell alleges that he found the MS. of Willibob his Avisa among his friend's papers left in his charge when Williboughy departed from Oxford on her majesty's service. There is no trace of any Hadrian Dorrell, and the name is probably fictitious; there is, indeed, good reason to think that the pseudonym, if such it is, covers the personality of the real author of the work. Willibob his Avisa proved extremely popular, and passed through numerous editions, and Peter Colse produced in 1596 an imitation named Penelope's Complaint.

WILLOCK (or WILLOCKS), JOHN (c. 1515-1582), Scottish reformer, was a native of Ayrshire and was educated at the university of Glasgow. After being a monk for a short time he embraced the reformed religion and went to London, where, about 1542, he became chaplain to Henry Grey, afterwards duke of Suffolk, the father of Lady Jane Grey. On the accession of Mary to the English throne in 1553 he went to Emden in Friesland, where he practised as a physician, varying this profession with visits to Scotland. He was associated with the leading Scottish reformers in their opposition to the queen regent, Mary of Lorraine, and the Roman Catholic religion, and in 1558 he returned definitely to his native land. Willock now began to preach and in 1559 was outlawed. Popular sympathy, however, rendered this sentence fruitless, and in the same year, being Knox's deputy as minister of St Giles' cathedral, Edinburgh, he frustrated the efforts of the regent to restore the Roman Catholic religion, and administered the communion for the first time in accordance with the ideas of the reformers. He was one of the four ministers chosen by the convention of October 1559 to seats on the council of government, and was one of those appointed to compile the first book of discipline. About 1562 he became rector of Loughborough in Leicestershire, but he retained his connexion with the Scottish church and was moderator of the general assembly in 1562, and again in 1564, in 1565 and in 1568. He died at Loughborough on the 4th of December 1585.

WILLOWBY, the name of an English family long settled in Nottinghamshire, and now represented by Baron Middleton. Having exchanged his name of Bugge for that of Willoughby, Richard de Willoughby became a judge during the reign of Edward II, and purchased the manors of Wollaton in Nottinghamshire and of Risley in Derbyshire. His son, Richard de Willoughby (d. 1362), was justice of the common pleas under Edward III. Richard's descendant, Dorothy, who became the heiress of the family estates, married Robert Willoughby of Bore Place, Kent, and their descendant, Sir Thomas Willoughby, Bart. (c. 1670-1729), of Wollaton, was created Baron Middleton in 1712. In 1757 his descendant, Digby Wentworth Bayard Willoughby (b. 1844), became the 9th baron. This title must be distinguished from that of Viscount Middleton, borne by the Brodrick family.

Sir Hugh Willoughby, the seaman, was a member of this family. He was a son of Sir Henry Willoughby (d. 1528), and a grandson of Sir Hugh Willoughby of Wollaton. His early services were as a soldier on the Scottish borders, but he soon turned his thoughts to the sea, and was appointed captain of a fleet of three ships which set out in 1553 with the object of discovering a north-eastern passage to Cathay and India. Two of the three ships reached the coast of Lapland, where it was proposed to winter, and here Willoughby and his companions died of cold and starvation soon after January 1554. A few years later their remains were found, and with them Willoughby's Journal, which is printed in vol. i. of R. Hakluyt's Principal Navigations.

Another famous member of this family was Sir Nesbit Josiah Willoughby (1777-1849), who entered the British navy in 1790 and was present at the battle of Copenhagen. In 1800, however, he was dismissed from the service by the sentence of a court-martial for his insolent conduct towards a superior officer, a previous offence of this kind having been punished less severely. In 1803, on the renewal of war, as a volunteer he joined an English squadron bound for the West Indies, and was soon admitted again to the navy; his courage and promptness at Cape François were responsible for saving 900 lives, and he distinguished himself on other occasions, being soon restored to his former rank in the service. After further services in the West Indies, during which he displayed marked gallantry on several occasions, Willoughby was tried by court-martial at Cape Town in 1808 on charges of cruelty; he seems to have taken a great delight in inflicting punishment, but he was acquitted with the advice to be more moderate in future in his language. Again in the West Indies, where he commanded the Néréide, he was responsible for the heroic defence made by his ship against a much stronger French force at Port Louis, Mauritius, in August 1810, when 222 out of his crew of 281 men were disabled before he surrendered. Undeterred by the severe wounds which he had received, and seeing no prospect of active service with the British fleet, Willoughby offered his services in 1812 to the Russian government, and while serving with the Russian army he was captured by the French. He was taken to France, whence he escaped to England. Having seen a little more service in the navy, he was knighted in 1827, was made a rear-admiral in 1847, and died unmarried in London on the 19th of May 1849.

WILLOW (Salix), a very well-marked genus of plants constituting, with the poplar (Populus), the order Salicaceae. Willows are trees or shrubs, varying in stature from a few inches, like the small British S. herbacea and arctic species generally, to 100 ft., and occurring most abundantly in cold or temperate climates in both hemispheres, and generally in moist situations; a few species occur in the tropical and sub-tropical portions of the three great continents. Their leaves are deciduous, alternate, simple, and generally much longer than broad, whence the term willow-leaved has become proverbial. At their base they are provided with stipules, which are also modified to form the scales investing the winter buds. The flowers are borne in catkins (fig. 1), which are on one tree male (staminate) only, on another female (pistillate). Each male flower consists of a small scale or bract, in the axil of which are usually two, sometimes three, rarely five stamens, and still more rarely a larger number. In addition there is a small glandular disk, which assumes different shapes in different species. The female flowers are equally simple, consisting of a bract, from whose axil arises usually a very short stalk, surmounted by two carpels adherent one to the other for their whole length, except that the upper ends of the styles are separated into two stigmas. When ripe the two carpels separate in the form of two valves and liberate a large number of seeds, each provided at the base with a tuft of silky hairs, and containing a straight embryo without any investing albumen. The flowers appear generally before the leaves and are thus rendered more conspicuous, while passage of pollen by the wind is facilitated. Fertilization is effected by insects, especially by bees, which are directed in their search by the colour and fragrance of the
flowers; but some pollen must also be transported by the wind to the female flowers, especially in arctic species which, in spite of the poverty of insect life, set abundant fruit. The tuft of hairs at the base facilitates rapid dispersion of the seed, early germination of which is rendered desirable owing to its tenacity. Although the limitations of the genus are well marked, and its recognition in consequence easy, it is otherwise with regard to the species. The greatest difference of opinion exists among botanists as to their number and the bounds to be assigned to each; and the cross-fertilization that takes place between the species intensifies the difficulty. Andersen, a Swede, spent nearly a quarter of a century in their investigation, and ultimately published a monograph which is the standard authority on the subject. He admits about a hundred species. Professor C. S. Sargent (Silvics of North America) suggests 160 to 170 as the number of distinguishable species. Some botanists have enumerated 80 species from Great Britain alone, while others count only 12 or 15. Dr Buchanan White, who made a special study of the British willows, grouped them under 17 species with numerous varieties and hybrids. To illustrate the great perplexity surrounding the subject, we may mention that to one species, _S. nigricans_, one hundred and twenty synonyms have been attached. Some of these are doubtless such as no botanist, with adequate material for forming an opinion, would accept; but, after making the necessary deductions for actual mistakes and misstatements, there still remains a large number upon which legitimate differences of opinion prevail. Andersen says that he has rarely seen two specimens of this species which were alike in the collective characters offered by the stature, foliage, and cattins. Not better example could be found of the almost limitless variation in so-called species.

Few genera have greater claims to notice from an economic point of view. As timber trees many of the species are valuable from their rapidity of growth and for the production of light durable wood, serviceable for many purposes. Among the best trees of this kind are _S. fragilis_, the crack willow (fig. 2), especially the variety known as _S. fragilis_, var. _Russelliana_, and _S. alba_, the white or Huntington willow. These trees are usually found growing by rivers' banks or in other moist situations, and are generally pollarded for the purpose of securing a crop of straight poles. This plan is, however, objectionable, as inducing decay in the centre of the trunk. Where poles are required, it is better to cut them when young, as near the soil. The wood of _S. fragilis_ is used for cricket-bats; there is a great difference in the value for this purpose of timber from different soils; and wood of the female tree is said to be preferable. Some of _S. caprea_ (fig. 1), a hedgerow tree, generally grows in drier situations. It is a useful timber tree, and its wood, like that of _S. alba_, is prized in the manufacture of charcoal. Its catkins are collected in England in August and to a certain extent the bright-coloured flowers being available in early spring when other decorations of the kind are scarce. Certain sorts of willow are largely used for basket-making and paper work, especially the _S. caprea_. The _S. repens_ and other dwarf kinds are useful for binding heathy or sandy soil. In addition to their use for timber or basket-making, willows contain a large quantity of tannin in their bark. A valuable medicinal glucoside named calicin is often found in the bark. The wood, especially of _S. alba_, is used for paper pulp. As ornamental trees some willows also take a high rank. The white willow is a great favourite, while the drooping habitat of the weeping willow renders it very attractive. _S. babylonica_, which is only a native of China, from which it has been widely spread by man; the willow of the Euphrates (Ps. cxxvii.) is in all probability _Populus euphratica_. _S. babonica_ is sometimes spoken of as Pope's willow, having been cultivated by that poet, or as Napoleon's willow, because his tomb at St Helena is overshadowed by a tree of this species, from which many offsets exist or are reputed to exist in modern gardens. _S. regalis_, however, has very white wood, and _S. rosmarinfolia_ is remarkable for its very narrow leaves—purplish above, silvery beneath.

The larvae of several nocturnal Lepidoptera feed upon the leaves of the willows, and the trunk of the willow is often injured by the perforations of the lunar hornet sphinx (_Trochilium crabroniforme_).

**WILLOW-HERB, in botany, the popular name for the species of _Epilobium_, a genus of often tall herbaceous plants, several of which are natives of Britain. The slender stems bear narrow leaves and pink or purple flowers, which in the rose-bay (_E. angustifolium_), found by moist river-sides and in copses, are 1 in. in diameter and form showy spikes. _E. hirsutum_, found by sides of ditches and rivers, a tall plant with many large rose-purple flowers, is known popularly as codlins-and-cream._

**WILLIAM GORMAN WILLIS, William Gilman Wills (1828-1894), Irish dramatist, was born at Kilmurry, Ireland, on the 28th of January 1828, the son of James Wills (1790-1868), author of _Lives of Illustrious and Distinguished Irishmen_ (1839-1847). The son was educated at Waterford Grammar School and Trinity College, Dublin. After several years of journalistic and literary work in Dublin, he settled in London, where he wrote stories for the magazines. In 1868 he determined that he could make a better living at portrait-painting, for which, though his art education had been meagre, he had always had talent. He soon made a fair income, though in the long run he was not financially successful. His most persistent absent-mindedness, lost him many sitters. Meanwhile he had begun to write for the stage. His first original work was the _Man o' Artie_, produced at the Princess's theatre, London, in 1867. Early in 1872 he was engaged by Colonel Bateman as "dramatist to the Lyceum" at an annual salary. Under the terms of his agreement he wrote _Medea in Corinth, Charles I._ and _Eugene Aram_, all of which were produced at the Lyceum in 1872-1873. With _Charles I._, in which Mr (afterwards Sir Henry) Irving confirmed the reputation he had earned by his performance in _The Bell_, Wills made a popular success, which he repeated in _Olivia_ (adapted from Goldsmith's _Vicar of Wakefield_) in 1873. From this date onwards Wills wrote continuously, and till 1887 his name was practically never absent from the bill of some London theatre. His work never, however, quite came up to the expectations which were based on his genuine ability,
and much of it is of an inferior quality. In Claudian (Princess’s Theatre, 1883) and Faust (Lyceum Theatre, 1883) he merely supplied the text to a variety of dramatic situations. In 1887 his mother, whom he had supported for many years, died, and after her death he seemed to have less incentive for work. Wills was a painter by choice, and never put his whole heart into his dramatic work. He had some skill in hallad-writing, shown in the well-known “I’ll sing thee songs of Araby.” He died on the 13th of December 1891.

WILLOUGHBY, FRANCIS (1663–1672), English ornithologist, and ichthyologist, son of Sir Francis Willughby, was born at New Waltham, near Grimsby, in Lincolnshire, in 1663. He is memorable as the pupil, friend and patron as well as the active and original co-worker of John Ray (q.v.) and, hence to be reckoned as one of the most important predecessors of Linnaeus. His connexion with Ray dated from his studies at Trinity College, Cambridge (1653–1659); and, after concluding his academic life by a brief sojourn at Oxford, and acquiring considerable experience of travel in England, he made an extensive Continental tour in his company. The specimens, figures and notes thus accumulated were in great part elaborated on his return into his Ornithologia, which, however, he did not live to publish, having injured a naturally delicate constitution by alternate exposure and over-study. This work was published in 1676, and translated by Ray as the Ornithology of Sir Willughby (London, 1678, fol.); the same friend published his Historia Piscium (1686, fol.). Willughby died at Middleton Hall on the 3rd of July 1672.

In Ray’s preface to the former work he gives Willughby much of the credit usually assigned to himself, both as critic and systematist. Thus, while founding on Gesner and Aldrovandus, he omitted their irrelevances, being careful to exclude “hieroglyphics, emblems, morals, fables, presages or outh else pertaining to divinity, ethics, grammar, or any sort of humane learning, and present him [the reader] with what properly belongs only to natural history.” And he not only devised artificial keys to his species and genera, but, “that he might clear up all these obscurities [of former writers] and render the knowledge and distinction of species facile, he bent his endeavours muchly to find out certain characteristic notes of each kind,” while, finally, in apologizing for his engravings, he yet not unjustly claims that “they are best and truest of any hitherto graven in brass.” (See also Ornithology.)

WILMINGTON, a city, a port of entry and the county-seat of New Castle county, Delaware, U.S.A., in the N. part of the state, near the Delaware river, at the mouth of Brandywine and Christiana creeks. Pop. (1800) 61,431; (1900) 76,928, of whom 10,478 were foreign-born (1820 Irish, 1762 German, 908 English) and 9736 were negroes; (1910 census) 87,411. Area, 10-18 sq. m. It is served by the Baltimore & Ohio, the Philadelphia, Baltimore & Washington (Pennsylvania) and the Philadelphia & Reading railways, and by several steamship lines. Wilmington Harbor includes Christiana Creek for 4 m. above its mouth and the navigable part (2 m.) of the Brandywine, which enters the Christiana about 1-2 m. above its mouth. By 1881 the channel depth had been increased from 8 to 15 ft., in 1896–1906 it was increased to 21 ft. in the lower part of the harbour, and in 1908 the upper part was dredged to 18 or 19 ft. for widths of 100, 200 and 250 ft. Between 1836 and 1900 $994,404 was expended on the improvement of the harbour. Most of the streets which run from E. to W. are numbered; those which run from N. to S. are named, often in honour of prominent American statesmen. The public parks and squares have a total area of 381 acres; the most important parks are Brandywine and Rockford, which lie along and near Brandywine creek, in the northern part of the city. Among the buildings of interest are the City Hall (1798); Holy Trinity (Old Swedes) Church (1698), probably the oldest church in the United States which has been in continuous use; the building occupied by the Historical Society of Delaware (organized in 1864), which was the old First Presbyterian Meeting House, built in 1740; the County Court House; and the Federal building. In Wilmington, besides other educational institutions, is the Wilmington Friends’ School (1748), the oldest preparatory school in the state. The Wilmington Institute Free Library (69,000 volumes in 1901) was founded in 1878, but was not made free to the public until 1894. Wilmington is the see of a Roman Catholic bishop, and of a Protestant Episcopal bishop.

The favourable situation, railway facilities and proximity to the coal-fields of Pennsylvania, West Virginia and Virginia, to the sources of supply of raw materials, and the water-power furnished by the Brandywine, combined with the enterprise of its citizens, have made Wilmington the most important manufacturing centre of Delaware. In 1905 the value of the factory products of the city, $60,399,699, was 73.5% of the total product value of the state. The principal manufactures are tann'd, (except $432,180), paper and wood pulp ($8,904,556), &c. Shipbuilding ($7,870,904 in 1905) was established as early as 1739, and in 1836 the first iron shipyard and in 1854 the first iron sailing-boat built in the United States were built here. On the Brandywine, near the city, are the works of the Du Pont Powder Company, which extend over nearly 1000 acres, the largest powder plant in the world. The company was founded in 1802 by the French refugee, Eleuthère Irénée du Pont de Nemours (1711–1844), who had learned from his father, Henri du Pont (1698), the art of powder-making, and he introduced them into the United States. Wilmington is the port of entry of the customs district of Delaware, with branch offices at New Castle and Lewes. In 1909 the imports of the district were valued at $463,902.

The city is governed under a charter of 1886, amended in 1893, by a mayor, who is chosen biennially and who appoints the board of water commissioners and the board of directors of the street and sewer departments, and by a unicameral legislature, the twelve members of which are elected by wards (except the president of the council, who is elected at large, and is acting mayor in the absence of the mayor). The council appoints the auditor, the clerk of council who acts as city clerk and various inspectors, &c. The police commission is appointed by the resident associate judge of New Castle county court. A board of education (two members from each ward), the city attorney and the city treasurer are elected by popular vote.

The site of Wilmington was settled in 1638 on behalf of the South Company of Sweden by Swedish and Dutch colonists, under the leadership of Peter Minuit. The fort which they built was called Christiana, and the settlement that grew up around it, Christinham, in honor of Queen Christina, the daughter of Gustavus Adolphus. The fort was captured, without bloodshed, by Governor Peter Stuyvesant of New Netherland in 1655, but very few of the Swedes left Christinham. The Swedish language and Swedish customs persisted, and the religion of the Swedes was tolerated. After the English conquest in 1664, especially after the annexation of the Delaware counties to Pennsylvania in 1682, Swedish influence declined. In 1731 a large part of the territory now included in the city was owned by Thomas Willing, named it Willingtown. About eight years later a borough charter granted by William Penn, this name was changed to Wilmington, in honour of Spencer Compton, Earl of Wilmington (c. 1673–1743). During the War of Independence the battle of Brandywine was fought 13 m. N.W. of Wilmington. In the first half of the 19th century Wilmington was the centre of a strong anti-slavery sentiment and was a “station” of the “Underground Railroad.” In 1809 the borough was enlarged by a new charter; in 1832 Wilmington was chartered as a city. In 1900 the city contained 41.4% of the total population of the state and, under the state constitution of 1897, it elects five of the thirty-five representatives and two of the seventeen senators in the state legislature.

See Records of Holy Trinity—(Old Swedes) Church (Wilmington, 1891); Benjamin Ferris, History of the Original Settlements on the Delaware, part ii. (Wilmington, 1846); and Elizabeth Montgomery, Reminiscences of Wilmington (Philadelphia, 1851).

WILMINGTON, a city, a port of entry and the county-seat of New Hanover county, North Carolina, U.S.A., on the Cape Fear river, about 30 m. from its mouth, 10 m. in direct line from the ocean, and about 145 m. S.S.E. of Raleigh. Pop. (1890) 26,658; (1900) 26,976, of whom 10,407 were negroes and 467
were foreign-born; (1910 census) 25,748. It is the largest city and
the chief seaport of the state. Wilmington is served by the
Atlantic Coast Line and the Seaboard Air Line railways,
and by steamboat lines to New York, Philadelphia and Baltimore
and to ports on the Cape Fear and Black rivers, and is connected
by an electric line with Wrightsville Beach, a pleasure resort
12 m. distant on the Atlantic Ocean. Below Wilmington the
channel of the Cape Fear river is 20 ft. deep throughout and in
some parts 22 and 24 ft. deep; the width of the channel is to
be made 270 ft. under Federal projects on which, up to the 30th
of June 1909, there had been expended $4,344,029. Above Wil-
mington the Cape Fear river is navigable for 115 m. to Fayetteville.
The city lies on an elevated sand ridge and extends along the river front for about 23 m. Among
its prominent buildings are the United States Government Building, the United States marine hospital, the city and county
hospital, the county court house, the city hall (which houses the
public library) and the masonic temple. The city is the seat of
Cape Fear Academy (1872) for boys, of the Academy of the
Incarnation (Roman Catholic) and of the Gregory Normal School
(for negroes). The city is the site of a Protestant Episcopalian
bishops' residence. There are deposits of Oolite (white marble),
large quantities of cotton, lumber, naval stores, rice, market-
garden produce and turpentine; in 1909 the value of its exports
was $23,319,070 and the value of its imports $1,282,724. The
total value of the factory product in 1905 was $3,155,458, of which
$893,715 was the value of lumber and timber products.
A settlement was established here in 1730 and was named
New Liverpool; about 1732 the name was changed to New
town; in 1739 the town was incorporated, was made the
county-seat and was renamed, this time in honour of Spencer
Compton, Earl of Wilmington (c. 1673-1743). In 1760 it was
incorporated as borough and in 1806 was chartered as a city.
Some of Wilmington's citizens were among the first to offer
armed resistance to the carrying out of the Stamp Act, compelling
the stamp-master to take an oath that he would distribute no
stamps. During most of 1781 the borough was occupied by the
British, and Lord Cornwallis had his headquarters here.
Although blockaded by the Union fleet, Wilmington was during
the Civil War the centre of an important intercourse between the
Confederacy and foreign countries by means of blockade
runners, and was the last important port open to the Confederates.
It was defended by Fort Fisher, a heavy earthwork on the
peninsula between the ocean and Cape Fear river, manned by
1,300 men under Colonel William Lamb. A federal expedition of
150 vessels under Admiral D. D. Porter and land forces (about
3000) under General B. F. Butler approached the fort on the
20th of December 1864; on the 24th the "Louisiana," loaded
with 215 tons of powder, was exploded 400 yds. from the fort
without doing any damage; on the 24th and 25th there was
a terrific naval bombardment, which General Butler decided had
not sufficiently injured the fort to make an assault by land
possible; on the 13th and 14th of January there was another
bombardment, and on the 15th a combined naval and land
attack, in which General A. H. Terry, who had succeeded General
Butler in command, stormed the fort with the help of the
marines and sailors, and took 2000 prisoners and 100 guns.
The Union losses were 266 killed, 57 missing and 198 wounded.
A magazine explosion on the morning of the 16th killed about
100 men in each army. The city was evacuated immediately
afterwards.

WILMOT, DAVID (1814-1868), American political leader,
was born at Bethany, Pennsylvania, on the 29th of January 1814.
He was admitted to the bar in 1834 and practised law in town. He
entered politics as a Democrat, served in the National House of
Representatives from 1845 to 1851, and although he favoured
the Walker Tariff, the Mexican War and other party measures,
opposed the extension of slavery. On the 8th of August 1856,
when a bill was introduced appropriating $2,000,000 to be used
by the government in negotiating a treaty of peace with Mexico,
Wilmot immediately offered the following amendment: "Pro-
vided, That, as an express and fundamental condition to the
acquisition of any territory from the Republic of Mexico by
the United States, by virtue of any treaty which may be negotiated
between them, and to the use of the Executive of the
moneys herein appropriated, neither slavery nor involuntary
servitude shall ever exist in any part of said territory except
for crime, whereof the party shall first be duly convicted." The
amendment, famous in American history as the "Wilmot Proviso," was adopted by the House, but was defeated, with
the original bill, by the Senate's adjournment. A similar
measure was brought forward at the next session, the appropriation,
however, being increased to $3,000,000, and the amendment
was again rejected by the Senate, which might have been adopted
by the United States; in this form it passed the House by a
vote of 115 to 105; but the Senate refused to concur, passed
a bill of its own without the amendment; and the House,
owing largely to the influence of General Lewis Cass, in March
1847, receded from its position. The amendment was never
actually adopted by Congress, and was in fact expressly repudiated
in the Compromise of 1850, and its content declared unconstitutional by the Supreme Court in the Dred Scott case.
Although known as the Wilmot Proviso it really originated with
the New York Congressman Joseph D. Dix. The idea of the
extension of slavery was never presented to the public by the
party standing which was more regular. The extension of the principle to territory other than that to be acquired from Mexico was probably due to Preston King (1806-
1869) of New York. Wilmot supported Van Buren in 1848 and
entered the Republican party at the time of its formation, and
was a delegate to the national conventions of 1856 and 1860.
He was president judge of the 13th Judicial District of Penn-
sylvania in 1853-1851, United States senator in 1851-1863 and
Judge of the United States Court of Claims in 1863-1868.
He died at Towanda, Pennsylvania, on the 16th of March 1868.
See G. P. Garrison, Westward Extension (New York and London,
1906).

WILSON, ALEXANDER (1766-1813), American ornithologist,
was born in Paisley, Scotland, on the 6th of July 1766. His
father, a handloom weaver, soon removed to the country, and
there combined weaving with agriculture, distilling and smuggling
—conditions which no doubt helped to develop in the boy
love of rural pursuits and adventure which was to determine
his career. At first he was placed with a tutor and destined
for the church, but afterwards he was apprenticed as a weaver.
Then he became a peddler and spent a year or two in travelling
throughout Scotland, recording in his journal every matter of
natural history or antiquarian interest. Having incurred a
short imprisonment for lampooning the master-weavers in a
trade dispute, he emigrated to America in 1794. After a few
years of weaving, peddling and desultory observation, he
became a village schoolmaster, and in 1802 obtained an appoint-
ment near Philadelphia, where he formed the acquaintance of
William Bartram the naturalist. Under his influence Wilson
began to draw birds, having conceived the idea of illustrating
the ornithology of the United States; and thenceforward he
steadily accumulated materials and made many expeditions.
In 1806 he obtained the assistant-editorship of the American
edition of Ree's Encyclopaedia, and thus acquired more means
and leisure for his great work. American Ornithology, the first
volume of which appeared in the autumn of 1817, after which
he spent the winter in a journey "in search of birds and sub-
scribers." By the spring of 1815 seven volumes had appeared;
but the arduous expedition of this ten-year search of
maritime waterfowl to which the remaining volume was to be
devoted, gave a shock to his already impaired health, and he
suffered to dysentery at Philadelphia on the 23rd of August
1813.

Of his poems, not excepting the Forestier (Philadelphia, 1805),
nothing need now be said, save that they no doubt served to develop
his inventive powers. The eighth and ninth volumes of the
American Ornithology were edited after his decease by his friend
George Ord, and the work was continued by Lucien Bonaparte
a vol., Philadelphia, 1823). The tenth volume was published several times, and his Miscellaneous Prose Works and
Poems was edited with a memoir by the Rev. A. B. Grosart (Paisley,
1876). A statue was erected to him at Paisley in 1876.
WILSON, SIR DANIEL (1816–1892), archaeologist and Canadian educational reformer, was born in Edinburgh on the 5th of January 1816, the son of Archibald Wilson, a wine-merchant, and Janet Aitken. After studying at the High School and the University of Edinburgh, he spent the next ten years in journalism and in other forms of literary work (London 1837–1842, Edinburgh 1842–1847). In 1845 he became secretary to the Scottish Society of Antiquaries, and in 1848 published Memorials of Edinburgh in the Olden Time, of which the chief value lies in the numerous illustrations, done by himself. In 1851 appeared his most important work, Prehistoric Annals of Scotland, which placed him in the front rank of archaeologists.

In 1853 he became professor of History and English Literature in the University of Toronto, where his practical ability and energy soon made him the most important member of the staff. While writing extensively on the archaeology and anthropology of Canada, and giving an impetus to the study, he produced nothing of lasting importance. His main work lay in asserting the claims of the University of Toronto, and of University College, the teaching body in connexion with it, against the sectarian universities of the province which denounced the provincial university as godless, and against the private medical schools in Toronto. Largely owing to Wilson's energy in fighting for what he called "the maintenance of a national system of university education in opposition to sectarian or denominational colleges," the provincial university gained the chief position in the intellectual life of Ontario. Two of the sectarian universities, the Methodists and the Anglican, have now been united to the province university, but the Presbyterian (see KINGSTON) still retain a vigorous existence. He was equally successful in his struggle against the rival medical schools in Toronto, the chief of which is now incorporated with Toronto university. In his efforts to escape the control of local politicians he was less successful, and in some cases appointments to the provincial university were made for political rather than for academic reasons. Though seeing that in a young and democratic country the Scotch-American model must be followed rather than the English, and though resisting attempts to follow the practice of Oxford or Cambridge, Wilson was a believer in the merits of a modified form of the residential system.

He was one of the first in Canada to cast aside the classical tradition, and as early as 1836 had the courage to say: "It is just because . . . German and French are now the keys of so much modern philosophy and science that all wise University reformers are learning to give to modern languages the place they justly claim in a liberal education." In 1881 he was made president of Toronto university; and in 1885 president of the literature section of the Canadian Royal Society; in 1888 he was knighted, and in 1891 given the title of Baron of Toronto, of the city of Edinburgh. He died at Toronto on the 6th of August 1892.

WILSON, HENRY (1821–1879), vice-president of the United States from 1873 to 1875, was born at Farmington, New Hampshire, on the 16th of February 1821. His name originally was Jeremiah J. Colbath. His father was a day-labourer and very poor. At ten years of age the son went to work as a farm-labourer. He was fond of reading, and during his apprenticeship had read more than a thousand volumes. At the age of twenty-one, for some unstatable reason, he had his name changed by Act of the Legislature to that of Henry Wilson. At Natick, Massachusetts, whither he travelled on foot, he learned the trade of shoemaker, and during his leisure hours studied much and read with avidity. For short periods, also, he studied in the academies of Strafford, N.H., Wolfeborough, N.H., and Concord, N.H. After successfully establishing himself as a shoe manufacturer, he attracted attention as a public speaker in support of William Henry Harrison in the presidential campaign of 1840. He was in the state House of Representatives in 1841-42, 1846 and 1850, and in the Senate in 1844-45 and 1851-52. In 1848 he left the Whig party and became one of the chief leaders of the Free Soil party, serving as presiding officer of that party's national convention in 1852, acting as chairman of the Free Soil national committee and editing from 1858 to 1851 the Boston Republican, which he made the chief Free Soil organ. The Free Soil party nominated him for governor of the state in 1853, but he was defeated. For a short time (1858) he identified himself with the American or Know Nothing party, and afterwards acted with the Republican party.

In 1857 he was elected to the United States Senate and remained there by re-elections until 1873. His uncompromising opposition to the institution of slavery furnished the keynote of his earlier senatorial career, and he soon took rank as one of the ablest and most effective anti-slavery orators in the United States.

He had been deeply interested from 1840 until 1850 in the militia of his state, and had risen through its grades of service to that of brigadier-general. Upon the outbreak of the Civil War he was made chairman of the military committee of the Senate, and in this position performed most laborious and important work for the four years of the war. The Republicans nominated Wilson for the vice-presidency in 1872, and he was elected; but he died on the 22nd of November 1875 before completing his term of office.

He published, besides many orations, a History of the Anti-Slavery Measures of the Thirty-Seventh and Thirty-Eighth United States Congresses (1865); Military Measures of the United States Congresses of 1859 and 1860, containing History of the Thirty-Fifth and Forty-Third Congresses (1868) and a History of the Rise and Fall of the State Power in America (3 vols., 1872-1873), his most important works.

The best biography is that by Elias Nason and Thomas Russell, The Life and Public Services of Henry Wilson (Boston, 1876).

WILSON, HORACE HAYMAN (1786–1860), English orientalist, was born in London on the 26th of September 1786. He studied medicine at St. Thomas's Hospital, and went out to India in 1808 as assistant-surgeon on the Bengal establishment of the East India Company. His knowledge of metallurgy caused him to be attached to the mint at Calcutta, where he was for a time associated with John Leyden. He became deeply interested in the ancient language and literature of India, and by the recommendation of Henry T. Colebrooke, he was in 1811 appointed secretary to the Asiatic Society of Bengal. In 1813 he published the Sanskrit text— with a graceful, if somewhat free, translation in English rhymed verse—of Kâlidâsa's charming lyrical poem, the Megkodâta, or Cloud-Messenger. He prepared the first Sanskrit-English Dictionary (1819) from materials compiled by native scholars, supplemented by his own researches. This work was only superseded by the Sanskritwörterbuch (1853-1876) of R. von Roth and Otto Böhtlingk, who expressed their obligations to Wilson in the preface to their great work. Wilson published six Select Sketches of the Theatre of India (1816), which contained a very full survey of the Indian drama, translations of six complete plays and short accounts of twenty-three others. His Macensske Collection (1828) is a descriptive catalogue of the extensive collection of Oriental, especially South Indian, MSS. and antiquities made by Colonel Colin Mackenzie, now deposited partly in the India Office, London, and partly at Madras. He also wrote a Historical Sketch of the First Burmese War, with Documents, Political and Geographical (1827), a Review of the External Commerce of Bengal from 1813 to 1828 (1830) and a History of British India from 1805 to 1835, in which his name, under that of Mill's History (1844-1848). He acted for many years as secretary to the committee of public instruction, and superintended the studies of the Sanskrit College in Calcutta. He was one of the staunchest opponents of the proposal that English should be made the sole medium of instruction in native schools, and became for a time the object of bitter attacks. In 1832 the university of Oxford selected Dr Wilson to be the first occupant of the newly founded Boden chair of Sanskrit, and in 1836 he was appointed librarian to the East India Company. He was an original member of the Royal Asiatic Society, of which he was director from 1837 up to the time of his death, which took place in London on the 8th of May 1860.
A full list of Wilson's works may be found in an Annual Report of the Royal Asiatic Society for 1860. A considerable number of Sanskrit MSS. (540 vols.) collected by Wilson in India are now in the Bodleian Library.

WILSON, JAMES (1742-1798), American statesman and jurist, was born in or near St Andrews, Scotland, on the 14th of September 1742. He matriculated at the University of St Andrews in 1753 and was subsequently a student at the universities of Glasgow and Edinburgh. In 1765 he emigrated to America. Landing at New York in June, he went to Philadelphia in the following year and in 1766-1767 was instructor in Latin in the college of Philadelphia, later the university of Pennsylvania. Meanwhile he studied law in the office of John Dickinson and was admitted to the bar in 1767, removed first to Reading and soon afterward to Carlisle, and rapidly rose to prominence. In August 1774 he published a pamphlet Considerations on the Nature and Extent of the Legislative Authority of the British Parliament, in which he argued that parliament had no constitutional power to legislate for the colonies; this pamphlet strongly influenced members of the Continental Congress which met in September. Wilson was a delegate to the Pennsylvania provincial convention in January 1775, and he sustained there the right of Massachusetts to resist the change in its charter, declaring that as the force of goven tm ent was exercising to compel obedience was "force unwaranted by any act of parliament, unsupported by any principle of the common law, unauthorized by any commission from the crown," resistance was justified "both the letter and the spirit of the British constitution"; he also, by his speech, led the colonies in shifting the burden of responsibility from parliament to the king's ministers to the king himself. In May 1775 Wilson became a member of the Continental Congress. When a declaration of independence was first proposed in that body he expressed the belief that a majority of the people of Pennsylvania were in favor of it, but as the instructions of the delegates from Pennsylvania and some of the other colonies opposed such a declaration, he urged postponement of action for the purpose of giving the constituents in those colonies an opportunity of removing such instructions. When independence was finally declared the unanimity of all the colonies except New York had been obtained. Receiving a commission as colonel in May 1775, Wilson raised a battalion of troops in his county of Cumberland, and for a short time in 1776 he took part in the New Jersey campaign, but his principal labors in 1776 and 1777 were in Congress. In 1776 he was appointed a member of a committee to prepare an address to the colonies, and the address was written by him; he served on a similar committee in May 1777, and wrote the address To the Inhabitants of the United States, urging their firm support of the cause of Independence; he drafted the plan of treaty with France together with instructions for negotiating it; he was a member of the Board of War from its establishment in June 1776 until his retirement from Congress in September 1777; from January to September 1777 he was chairman of the Committee on Appeals, to hear and determine appeals for the cause of adversity in the several states, and he was a member of many other important committees. In September 1777 the political faction in his state which had opposed Independence again came into power, and Wilson was kept out of Congress until the close of the war; he was back again, however, in 1781, and 1785-1786, and, advocating a sound currency, laboured in co-operation with Robert Morris to direct the financial policy of the Confederation.

Soon after leaving Congress in 1777 Wilson removed to Annapolis, Maryland, to practice law; he returned to Philadelphia the following year. In 1779 he was commissioned Advocate-General for France, and in this capacity he represented Louis XVI. in all claims arising out of the French alliance until the close of the war. In 1781-1782 he was the principal counselor for Pennsylvania in the Wyoming Valley dispute with Connecticut, which was decided in favor of Pennsylvania in December 1782 by an arbitration court appointed by Congress. Wilson was closely associated with Robert Morris in organizing the Bank of North America, and in the Act of Congress incorporating it (December 31, 1781) he was made one of the directors. In 1790 the legislature of Pennsylvania granted him his son's, this bank, but three years later it passed an act to repeal it. Wilson responded with a famous constitutional argument in which he sustained the constitutionality of the bank on the basis of the implied powers of Congress.

As a constructive statesman Wilson had no superior in the Federal Convention of 1787. He favoured the independence of the executive, legislative and judicial departments, the supremacy of the Federal government over the state governments, and the election of senators as well as representatives by the people, and he opposed the election of the President or the judges by Congress. His political philosophy was based upon implicit confidence in the people, and he strove for such provisions as he thought would best guarantee a government by the people. When the constitution had been framed Wilson pronounced it "the best form of government which has ever been offered to the world," and he, at least, among the framers regarded it not as a compact but as an ordinance to be established by the people. During the struggle for ratification he made a speech before a mass meeting in Philadelphia which has been characterized as "one of the best speeches of the whole subject." In the Pennsylvania ratification convention (November 10 to December 15, 1787) he was the constitution's principal defender. Having been appointed professor of law in the university of Pennsylvania in 1790, he delivered at that institution in 1790-1791 a course of lectures on public and private law; some of these lectures, together with his speeches in the Federal convention, before the mass meeting in Philadelphia, and in the Pennsylvania ratification convention, are among the most valuable commentaries on the constitution.

Wilson was a delegate to the state constitutional convention of 1789-1790, and a member of the committee which drafted the new constitution. In 1798 Washington appointed him an associate justice of the United States Supreme Court, and in 1793 he wrote the important decision in the case of Chisolm v. Georgia, the purport of which was that the people of the United States constituted a sovereign nation and that the United States were not a mere confederacy of sovereign states. He continued to serve as associate justice until his death, near Edenton, North Carolina, on the 28th of August 1798.

WILSON, JAMES (1815-1908), American administrator, was born in Ayrshire, Scotland, on the 16th of August 1835. In 1851 he was taken by his parents to America, where they originally settled in Connecticut, but in 1855 removed to Tama county Iowa. He studied at Iowa College, and in 1861 became a farmer. He was a Republican member of the state House of Representatives in 1868-1873, and was its speaker in 1872-1873, and he was a member of the National House of Representatives from 1873 to 1877 and again in 1883-1885. From 1870 to 1874 he was a regent of the State University of Iowa; in 1877-1881 he was a member of the Iowa State Railway Commission, and from 1890 to 1897 was professor of agriculture at the Iowa Agricultural College, at Ames, and director of the State Agricultural Experimental Station. In March 1897 he became Secretary of Agriculture in President McKinley's Cabinet and served into President Taft's administration, holding office longer than any other cabinet officer since the organization of the government.
Wilson, John (1627-1696). English playwright, son of Aaron Wilson, a royalist divine, was born in London in 1627. He matriculated from Exeter College, Oxford, in 1644, and entered Lincoln's Inn two years later, being called to the bar in 1649. His unsparing support of the royal pretensions recommended him to James, duke of York, through whose influence he became Recorder of Londonerry about 1681.

*His Discourse of Monarchy* (1684), a tract in favour of the succession of the duke of York, was followed (1689) by a "Pindarique" on his coronation. In 1688 he wrote *Julius Caesar*, a learned defence of James's action in dispensing with the oath of succession. He died in obscurity; due perhaps to his political opinions, in 1696. Wilson was the author of four plays, showing a vigorous and learned wit, and a power of character-drawing that places him rather among the followers of Ben Jonson than with the Restoration dramatists.

*The Chess* (written in 1662, printed 1664, 1671, &c.) was played with great success in 1663. John Lacy found one of his best parts in Scruple, a caricature of a Presbyterian minister of accommodating morality. *Andronicus Comnenus* (1664), a blank verse tragedy, is based on the story of Andronicus Comnenus as told by Peter Heylin in his *Cosmography*. It contains a scene on the Scotch border where the Duke of Aleskia, which follows very closely Shakespeare's treatment of a parallel situation in *Richard III*. *The Projectors* (1665), a popular comedy of London life, is, like Molière's *Lesavelengths* and *Les Avarees*, an attack on society, but there is no evidence that Wilson was acquainted with the French play. *Belphegor*, or the *Marriage of the Devil; A Tragi-comedy* (1669), treats of a theme familiar to Elizabethan drama, but Wilson took the subject from the Bible. *Euphues* and *The Plaister of Paris* (1670) are also by him. He also translated into English Erasmus's *Encomium Moriae* (1668).

Wilson, John (1758-1854). Scottish writer, the Christopher North of Blackwood's Magazine, was born at Paisley on the 8th of May 1758, the son of a wealthy gauze manufacturer who died when John was eleven years old. He was the fourth child, but the eldest son, and he had nine brothers and sisters.1 He was only twelve when he was first entered at the university of Glasgow, and he continued to attend various classes in that university for six years, being for the most part under the tutorage of Professor George Jardine, with whose family he lived. In these six years Wilson "made himself" in all ways, acquiring not inconsiderable scholarship, perfecting himself in all sports and exercises, and falling in love with a certain "Margaret," who was the object of his affections for several years.

In 1803 Wilson was entered as a gentleman commoner at Magdalen College, Oxford. Few men have felt more than he the charm of Oxford, and in much of his later work, notably in the essay called "Old North and Young North," he has expressed his feeling. But it does not appear that his Magdalen days were altogether happy, though he perfected himself in "brushing," pedestrianism and other sports, and read so as to obtain a brilliant first class. His love affairs did not go happily, and he seems to have made no intimate friends at his own college and few in the university. He took his degree in 1807, and found himself at twenty-two his own master, with a good income, no father or guardian to control him, and apparently not under any of the influences which in similar circumstances generally make it necessary for a young man to adopt some profession, if only in name. His profession was an estate on Windermere career, which he did not take; with his colleagues, he built, boated, wrestled, shot, fished, walked and otherwise diverted himself for four years, besides composing or collecting from previous compositions a considerable volume of poems, published in 1812 as the *Isle of Palms*. Here he became intimate with Wordsworth, Coleridge, Southey and De Quincey.

1 His youngest brother was James Wilson "of Woodville" (1795-1896), the zoologist. He purchased, on behalf of Edinburgh University, in Paris, the Dufresne collection of birds, and arranged them in the University Museum. He contributed to *Blackwood's Magazine* and to the *North British Quarterly Review*, and wrote many of the articles on natural history in the seventh edition of the *Encyclopaedia Britannica*.

He married in 1811 Jane Penn, a Liverpool lady of good family, and four years of happy married life at Elleray succeeded; then came the event which made a working man of letters of Wilson, and without which he would probably have produced a few volumes of verse and nothing more. The major part of his fortune was lost by the dishonest speculation of an uncle, in whose hands Wilson had carelessly left it. But this hard fate was by no means unqualified. His mother had a house in Edinburgh, in which she was able and willing to receive her son and his family; nor had he even to give up Elleray, though the house was, as he was not able constantly to reside in it. He read law and was called to the Scottish bar, in 1815, still taking many a sporting and pedestrian excursion, and publishing in 1816 a second volume of poems, *The City of the Plague*. In 1817, soon after the founding of *Blackwood's Magazine*, Wilson began his connexion with that great Tory monthly by joining with J. G. Lockhart in the November number, in a satire called the *Chaldee Manuscript*, in the form of a biblical parody, on the rival *Edinburgh Review*, its publisher and his contributors. From this time he was the principal writer for *Blackwood's*, though without official editor, the publisher retaining a certain supervision even over Lockhart's and "Christopher North's" contributions, which were the making of the magazine. In 1822 began the series of *Nectes Ambrosianae*, after 1825 mostly Wilson's work. These are discussions in the form of convivial table-talk, giving occasion to wonderfully various digressions of criticism, description and miscellaneous writing. From their origin it necessarily followed that there was much ephemeral, a certain amount purely local, and something wholly trivial in them. But their dramatic force, their incessant flashes of happy thought and happy expression, their almost incomparable fulness of life, and their magnificent humour give them all but the highest place among genial and reproductive literature. "The Ettrick Shepherd," an idealized portrait of James Hogg, one of the talkers, is a most delightful creation. Before this, Wilson had contributed to *Blackwood's* prose tales and sketches, and novels, some of which were afterwards published separately in *Lights and Shadows of Scottish Life* (1822), *The Trials of Margaret Lyndsay* (1823) and *The Foresters* (1825); later appeared essays on Spenser, Homer and all sorts of modern subjects and authors.

The best result of his new occupation on Wilson's general mode of life was that he left his mother's house and established himself (1830) in Ann Street, Edinburgh, with his wife and family of four children. The second was much more looked for, his election to the chair of moral philosophy in the university of Edinburgh (1820). His qualifications for the post were by no means obvious, even if the fact that the best qualified man in Great Britain, Sir William Hamilton, was also a candidate, be left out of the question. But the matter was made a political one; the Tories still had a majority in the town council; Wilson was powerfully backed by friends, Sir Walter Scott at their head; and his adversaries played into his hands by attacking his moral character, which was not open to any fair reproach. Wilson made a very excellent professor, never perhaps attaining to any great scientific knowledge in his subject or power of expounding it, but acting on generation after generation of students with a stimulating force that is far more valuable than the most exhaustive knowledge of a particular topic. His duties left him plenty of time for magazine work, and for many years his contributions to *Blackwood's* were extraordinarily numerous, in one year (1834) amounting to over fifty separate articles. Most of the best and best known of them appeared between 1825 and 1835.

The domestic events of Wilson's life in the last thirty years of it may be briefly told. He oscillated between Edinburgh and Elleray, with excursions and summer residences elsewhere, a sea trip on board the Experimental Squadron in the Channel during the summer of 1832, and a few other unimportant diversions. The death of his wife in 1837 was an exceedingly severe blow to him, especially as it followed within three years that of his friend Blackwood. For many years after, his literary work...
Wilson, J. H.—Wilson, Sir R. T. 695

was intermittent, and, with some exceptions, not up to the level of his earlier years. Late in 1850 his health showed definite signs of breaking up; and in the next year he resigned his professorship, and a Civil List pension of £30 a year was conferred on him. He died at Edinburgh on the 3rd of April 1854.

Only a very small part of Wilson's extensive work was published in a collected and generally accessible form during his lifetime, the chief and almost sole exceptions being the two volumes of poems referred to above. The best collection is Life and Creations of Christopher North (1842), a selection from his magazine articles. These volumes, with a selected edition of the Notes and Anti-Notes, are now in various hands, but not so imaginatively, also in four volumes, were collected and issued uniformly after his death by his son-in-law, Professor J. F. Ferrier. The collection is very far from exhaustive; and, though it undoubtedly contains most of his best work and comparatively little that is not good, it has been complained with some justice, that the characteristic, if rather immature, productions of his first eight years on Blackwood are almost entirely omitted, that the Notes are given but in part, if in their best part, and that at least three long, important and interesting series of papers, less desultory than his wont, on "Spenser," on "British Critics" and the set called "Diderot's Letters," have been left out altogether. These omissions, however, uniform enough, and the standard edition exhibits them sufficiently, if not exhaustively. His poems may be dismissed at once as little more than interesting. They would probably have been written and not highly esteemed by any man in the time of the full flood of the Lake school influence. His prose tales have in some estimates stood higher, but will hardly survive the tests of universal criticism. It is as an essayist and critic of the most astounding genius, if not of great, of acute, of extraordinary eloquence and of a fervid and manifold sympathy, in which he has hardly an equal, that Christopher North will live. His defects lay in the directions of measure and of taste properly so called, that is to say, of the modification of capricious likes and dislikes by reason and principle. He is constantlyaggerated, boisterous, wanting in refinement. But these are the almost necessary defects of his natural genius, egotism, eloquence, genuine feeling. The well-known adaptation of phrase in which he did not recant but made up for numerous earlier attacks on Leigh Hunt, the Annalistics are mortal, but the Humanities live for ever; and however as a critic he may have been but not without a little characteristic touch of grandiosity and emphasis. As a literary critic, as a sportsman, as a lover of nature and as a convivial humorist, he is not to be shown at equal advantage in miniature; but almost any volume of his miscellaneous works will exhibit him at full length in one of these capacities, if not in all.

See Christopher North, by Mrs Mary Gordon, his daughter (1862); and Notes and Anti-Notes, ed. by A. D. William Blackwood and his Sons (1897).

Jackson, W. Wilson (1837–1905), American cavalry soldier, was born at Shawneetown, Illinois, in 1837 and entered West Point military academy in 1855, graduating in 1860. He was appointed to the engineer branch of the United States army, served in the Port Royal and Fort Pulaski operations, being brevetted major for his gallant conduct at Pulaski, was on McLellan's staff at Antietam as a lieutenant-colonel in 1862, and as a topographical engineer on the headquarters staff of the Army of the Tennessee during the Vicksburg and Chattanooga campaigns. His services in the naval operations before Vicksburg were rewarded by promotion to brigadier-general U.S.V. In 1864 he was appointed to command a division in Sheridan's cavalry corps, and played a distinguishing part in the cavalry operations of the 4th to 6th of May during the battle of the Wilderness (for which he was brevetted colonel U.S.A.), the so-called Richmond Raid, the operations on the Totopotomoy, &c. Later in 1864 he commanded the cavalry of Thomas's army in Tennessee. During the closing operations of the war he led a cavalry expedition on a grand scale through the South-West to New Orleans, styling Selma, Montgomery, and Macon, and capturing at different times more than 7000 prisoners, including President Davis. He was promoted major-general of volunteers and brevetted major-general U.S.A. shortly before the end of the war. Returning to duty in the regular army as a lieutenant-colonel of infantry for some years, he resigned in 1870 and engaged in engineering and railway construction. In 1895, during the Spanish-American War, he was appointed a major-general in the new volunteer army, and took part in the operations in Porto Rico. He served in the China expedition of 1900 as a brigadier-general and in 1901 was placed on the retired list as a brigadier-general U.S.A.

Wilson, Richard (1714–1782), English landscape painter, was born at Penegoes, Montgomeryshire, where his father was a clergyman, on the 1st of August 1714. His early taste for art was observed by a relative of his mother, Sir George Wyne, who in 1729 sent him to London to study under Thomas Wright, a little-known portrait painter of the time, by whom he was instructed for six years. He then started on his own account, and was soon in a good practice. Among his commissions was a full-length of the prince of Wales as a youth, painted for his father, the bishop of Norwich. Examples of his portrait may be studied in Greenwich Hospital, in the Garrick Club, and in various private collections. In 1740 Wilson visited Italy, where he spent six years. He had previously executed some landscapes, but it was now that the advice of Zucarrelli and Joseph Vernet decided him to adopt this department of art exclusively. He studied Claude and Poussin, but retained his own individuality, and produced some admirable views of Rome and the Campagna. In 1755 he returned to England, and became one of the first of English landscape painters. "Niebuhr" one of his powerful works, was exhibited at the exhibition of Artists in 1760. On the establishment of the Royal Academy in 1768 he was appointed one of the original members, and he was a regular contributor to its exhibitions till 1780. He frequently executed replicas of his more important subjects, repeating some of them several times; in the figures which he introduced in his landscapes he was occasionally assisted by Mortimer and Hayman. During his lifetime his landscapes were never widely popular; his temper was consequently embittered by neglect, and so impoverished was he that he was obliged to decline himself in an obscure, half-furnished room in Tottenham Court Road, London. In 1776, however, he obtained the post of librarian to the Academy; and by the death of a brother he acquired a small property near Llanfarris, Denbighshire, to which he retired to spend his last days, and where he died suddenly in May 1782. After his death his fame increased, and in 1814 about seventy of his works were exhibited in the British Institution. The National Gallery, London, contains nine of his landscapes.

The works of Wilson are skilful and learned compositions rather than direct transcripts from nature. His landscapes are beautiful, but great breaches in the composition were occasioned which occasionally led to a disregard of detail. They are full of classical feeling and poetic sentiment; they possess noble qualities of colour, and of delicate silver tone; and their handling is vigorous and easy, the work of a painter who was thoroughly master of his materials.

Wilson, Robert (d. 1660), English actor and playwright, was a comedian in the earl of Leicester's company, beginning with its establishment in 1574, and from 1583 to 1588 in the Queen's and afterwards in Lord Strange's company. He wrote several morality plays. In his Three Ladies of London (1584) he has the episode of the attempt of the Jew to recover his debt, afterwards adapted by Shakespeare in The Merchant of Venice. Another Robert Wilson (1570–1610), probably his son, was one of Henslowe's dramatic back-writers. Wilson, Sir Robert Thomas (1777–1849), British general, was the son of the painter Benjamin Wilson (1721–1878), and obtained a commission in the 13th light dragoons in 1794, taking part in the famous charge at Villers-en-Cauchies. He was one of eight officers who received the emperor's commemoration medal (of which only nine were struck), the order of Maria Theresa and the dignity of Freiherr of the Empire. In the campaigns of Tourcoing and Tourney and in the retreat through Holland, Wilson repeatedly distinguished himself. In 1796 he became captain by purchase, in 1798 he served as a
brigade-major during the suppression of the Irish Rebellion, and in 1799 was with the 11th in the Heldef expedition. Having in 1800 purchased a majority in a regiment serving in the Mediterranean he was sent on a military expedition to Vienna in that year, but returned to take part in the battle of Alexandria. In 1802 he published an account of the expedition to Egypt, which was shortly afterwards translated into French, and created a considerable impression by its strictures upon French officers' baton-patry. Wilson shortly afterwards produced a translation of General Regnier's work on the same campaign, with comments. Shortly afterwards Wilson published a work on the defects of the British army system which is remembered as the first protest against flogging. In 1804 he bought the colonelcy of the 19th light dragoons, in 1805 exchanged into the 20th, and in 1806 served with the 20th in the Cape of Good Hope expedition. In 1807 he was employed as military attaché to a mission to the king of Prussia, and so was present at Eylau, Heilsberg and Friedland, of which battles he published an account in 1810. Returning to England with despatches from St Petersburg he reached London before the Russian declaration of war and so gave the admiralty twenty-four hours' start in the operation at sea. In the early part of the Peninsular War Wilson raised and commanded the Lusitanian Legion, an irregular Portuguese corps which did good service in 1808 and 1809 and formed the starting-point of the new Portuguese army organized by Beresford in 1810. His services were rewarded by knighthood, a colonelcy in the British army and the Portuguese order of the Tower and Sword. In 1811, with the rank of brigadier-general, he went to Turkey, and in 1812 he travelled thence to Russia, where he was attached to Kutuzov's headquarters during the pursuit of the retreating French, being present at Malo-Jaroslavietz, Vyazma and Krasnoye. His account of the campaign, published in 1816, is one of the most valuable works on these events. He continued to serve with the Russian army during 1813 and distinguished himself at Lützen and Bautzen, the emperor Alexander decorating him with the knighthood of the St George order on the battlefield. He was promoted major-general in the British army about the same time. He was at Dresden, Kulm and Leipâig, and distinguished himself at the last great battle so much that Schwarzenberg writing to the British ambassador at Vienna attributed to Wilson's skill a large part in the successful issue of the battle. But his services in the councils of the Allies were still more important on account of the confidence reposed in him personally by the allied sovereigns. But Castlereagh, treating Wilson as a political opponent, removed him to the minor theatre of Italy, in spite of the protests of the British ambassador. With the Austrian Army of Italy he served through the campaign of 1814. In 1816 after Waterloo he contrived the escape of many of Bonaparte's supporters, including himself, from the Restoration government, and was imprisoned for three months with his comrade in this adventure, Captain Hely-Hutchinson (3rd earl of Donoughmore), and censured by the commander-in-chief in a general order. In 1817 he published The Military and Political Power of Russia, in 1818 he became member of parliament for Southwark and in 1821 he interposed between the mob and the troops on the occasion of Queen Caroline's funeral, for which his political opponents secured his dismissal from the army, without compensation for the price of his commissions. He took an active part in politics on the opposition side, and also spent some time in Spain during the wars of 1822–23. On the accession of William IV., his political services in the formation of the Canning ministry of 1827 were rewarded by reinstallation in the army with the rank of lieutenant-general. But, disapproving of the Reform bill, he resigned his place in the Commons. He was promoted general in 1841 and appointed governor of Gibraltar in 1842. He died in London on the 9th of May 1849.

Besides the works mentioned above, Wilson left a diary of his travels and experiences in 1812–1814, published in 1861, and an incomplete autobiography, published two years later.

WILSON, THOMAS (c. 1525-1581), English statesman and critic, the son of Thomas Wilson of Strubby, in Lincolnshire, was born about 1525. He was educated at Eton and King's College, Cambridge, where he joined the school of Hellenists to which Cheke, Thomas Smith, Walter Haddon and others belonged. He graduated B.A. in 1546 and M.A. in 1549. In 1551 he produced, in conjunction with Walter Haddon, a Latin life of Henry and Charles Brandon, dukes of Suffolk. His earliest work of importance was The Rule of Reason, containing the Arte of Logique set forth in Englishis (1552), which was frequently reprinted. It has been maintained that the book on which Wilson's fame mainly rests, The Arte of Rhetorique, was printed about the same time, but this is probably an error: the first edition extant is dated January 1553. It is the earliest systematic work of literary criticism existing in the English language. Wilson threw in his lot with the Dudley family, and when they fell, he fled to the Continent. He was with Sir John Cheke in Padua in 1555–1557, and afterwards at Rome, whither in 1558 Queen Mary wrote, ordering him to return to England to stand his trial as a heretic. He refused to come, but was arrested by the Roman Inquisition and tortured. He escaped, and fled to Ferrara, but in 1560 he was once more in London. Wilson became Master of St Katherine's Hospital in the Tower, and entered parliament in January 1563. In 1570 he published a translation, the first attempted in English, of the Olymphiacs and Philippics of Demosthenes, on which he had been engaged since 1556. His Discourse upon Usury appeared in 1572. From 1574 to 1577, Wilson, who had now become a prominent person in the diplomatic world, was principally engaged on embassies to the Low Countries, and on his return to England he was made a privy counselor and sworn secretary of state; Wakley was his colleague. In 1588, although he was not in holy orders, Queen Elizabeth made Wilson dean of Durham. He died at St Katherine's Hospital on the 16th of June 1581, and was buried next day, "without charge or pomp," at his express wish. The Arte of Rhetorique gives Wilson a high place among the earliest artificers of English style; and it is interesting to see that he was opposed to pedantry of phrase, and above all to a revival of uncouth medieval forms of speech, and encouraged a simpler manner of prose writing than was generally appreciated in the middle of the 16th century.

WILSON, THOMAS (1663-1755), English bishop, was born at Burton, Cheshire, and educated at Trinity College, Dublin. He was ordained in 1686, and became curate at Newchurch Kenyon, Lancashire. In 1692 he was appointed chaplain to the 9th earl of Derby, who in 1697 offered him the bishopric of Sodor and Man. He was consecrated bishop in 1698. His episcopate was marked by a number of reforms in the Isle of Man. New churches were built, libraries founded and books were printed in Manx, his Principles and Duties of Christianity (1717) being the first book published in the language. He also encouraged farming, and set the example of planting fruit and forest trees. In order to restore discipline in the island he drew up in 1704 his well-known Ecclesiastical Constitutions. The judgments of his courts often brought him into conflict with the governors of the island, and in 1722 he was even imprisoned for a time in Castle Rushen. In 1737, however, the jurisdiction of the civil and spiritual courts was better defined by new statutes, the lordship of the island having passed in 1736 to James Murray, 2nd duke of Atholl, with whom Wilson had no personal difficulties. In 1749 on Zinzendorf's invitation he accepted the title of Antistes—a synonym for bishop—in the Moravian Church.

A life of Wilson, by John Keble, was published with his Works (Oxford, 1847-1863). The Sodor and Man Theological School in the Isle of Man is called in his memory the Bishop Wilson School.

WILSON, SIR WILLIAM JAMES ERASMUS, generally known as Sir Erasmus Wilson (1809-1884), British surgeon and philanthropist, was born in London on the 25th of November 1809, studied at St Bartholomew's Hospital in London, and at Aberdeen, and early in life became known as a skilful operator and dissector. It was under a sympathy with the poor of London and a suggestion from Thomas Wakley of the Lancet, of which Wilson acted for a time as sub-editor, which first led him to take
up skin diseases as a special study. The horrible cases of scrofula, anaemia and blood-poisoning which he saw made him set to work to alleviate the sufferings of persons so afflicted, and he quickly established a reputation for treating this class of patient. It was said that he cured the rich by ordering them to give up luxuries; the poor, by prescribing for them proper nourishment, and often at his expense.

In the opinion of one of his biographers, we owe to Wilson in great measure the habit of the daily bath, and he helped very much to bring the Turkish bath into use in Great Britain. He wrote much upon the diseases which specially occupied his attention, and his books, *A Healthy Skin and Student's Book of Diseases of the Skin*, though they were not received without criticism at the time of their appearance, long remained textbooks of their subject. He visited the East in order to study leprosy, Switzerland that he might investigate the causes of goitre, and Italy with the purpose of adding to his knowledge of the skin diseases affecting an ill-nourished peasantry. He made a large fortune by his successful practice and by skilful investments, and, since he had no family, he devoted a great deal of his money to charitable and educational purposes. He founded in 1869 the chair and museum of dermatology in the Royal College of Surgeons, of which he was chosen president in 1881, and which just before his death awarded him its honorary gold medal, founded in 1880 and only six times previously awarded. He also founded a professorship of pathology at Aberdeen University. After the death of his wife he sold his property, and in 1884 became president of the Royal College of Surgeons. In 1878 he earned the thanks of the nation, upon different grounds, by defraying the expense of bringing the Egyptian obelisk called Cleopatra's Needle from Alexandria to London, where it was erected on the Thames Embankment. The British government had not thought it worth the expense of transportation. He was knighted by Queen Victoria in 1881, and died at Westgate-on-Sea on the 7th of August 1884.

**WILSON, WOODROW** (1856— ), American educationist, was born in Staunton, Virginia, on the 26th of December 1856. He graduated at Princeton University at 1872, and was given his law degree by the University of Virginia in 1879–1880, practised law in Atlanta in 1882–1883, and received the degree of Ph.D. at Johns Hopkins University in 1886, his thesis being on *Congressional Government* (1885; and often reprinted). He was associate professor of history and political economy at Bryn Mawr in 1885–1888 and at Wesleyan University in 1888–1890; professor of jurisprudence and political economy at Princeton in 1890–1895; of jurisprudence in 1895–1897, and subsequently of jurisprudence and politics; and in 1902 he became president of Princeton University, a post which he held until his death on the 1st of November 1910, and was elected Democratic governor of New Jersey. His administration of the University was marked by the introduction of the "preceptorial" system, by the provision of dormitories and college eating-halls for members of the lower classes, and by the development of the graduate school.

He wrote: *The State: Elements of Historical and Practical Politics, Sketch of Institutional History and Administration* (1880); *The State and Federal Government of the United States* (1891); *Division and Reunion, 1829–1889* (1893) in the "Epochs of American History" series; *An Old Master and Other Political Essays* (1893); *More Literature and Other Essays* (1893); *George Washington* (1896), an excellent biography; the popular *History of the American People* (1902); *Constitutional Government in the United States* (1908), being Columbia University Lectures; and in the seventh volume of the *Cambridge Modern History* the chapter on "State Rights, 1850–1860".

**WILTON**, a market town and municipal borough in the Wilton parliamentary division of Wiltshire, England, 86 m. W. by S. of London, on the London & South-Western and Great Western railways. Pop. (1901) 2293. It lies among the pastures beside the rivers Nadder and Wyley. The church of St Mary and St Nicholas was built in 1684 by Lord Herbert of Lea, in a Romanesque style, richly adorned with medieval windows. The central entrance is upheld by twisted columns based upon stone lions. The belfry is detached. Wilton House, a little to the south, was founded by William Herbert, first earl of Pembroke by the second creation, on the estates of the dissolved convent, which were granted him by Henry VIII.

Tradition says that Shakespeare and his company played here before James I. in 1603, and it was the residence of Philip Sidney, the poet and soldier, of the artists Holbein and Vandyck, of the dramatists Jonson and Massinger, whose father was steward here, and of Inigo Jones the architect. The first folio edition of Shakespeare was dedicated to it. Seven years after the poet's death, to the third earl and his brother. In style Wilton House is Italian of the 16th century, with a porch added by Holbein. The garden front was rebuilt and other changes made by the advice of Charles l., and a frequent visitor; and many subsequent alterations were made. The art collections include the marbles gathered together by the eighth earl.

Carpet-making forms the main industry of Wilton; the most famous fabrics being those known as Wilton carpets; Saxon carpets made of short-staple wool; and the rich and durable Axminsters, long woven by hand at Axminster in Devonshire. It is also an important Centre for the sale of sheep. The town is governed by a mayor, 4 aldermen and 12 councillors. Area, 1915 acres.

A chantry was founded here about A.D. 800, afterwards changed into a priory of Benedictine sisters, and refounded by Alfred. In 968 Wulftrude, a mistress of King Edgar, became abbess; and the same office was declined by her daughter Edith, who died at twenty-three. Miracles, it was said, were worked by Edith's remains, and she became patron saint of the convent, which afterwards gave shelter to many noble ladies and survived until the Dissolution; its abbess was a baronetess of England. Antiquarians have seen in Wilton the core of a British kingdom. It was certainly the chief town of the Wilsaetas, or men of Wils, whom Cynric the Saxon leader crushed in 536. It afterwards became a residence of the Wessex kings; and here, in 871, Alfred was severely defeated by the Danes. Wilton was burned in 1063 by Sweyn, the Danish king. After the Conquest it ranked among the richest of royal boroughs. In 1141 Queen Matilda celebrated Easter here with great pomp, and two years later Stephen, who came to found a castle, was driven off by her adherents. The prosperity of Wilton began to fall when Icknield Street, the great highway of commerce, was diverted to pass through Salisbury in 1224; and its decline was hastened by the plague, by which a third of the townsfolk were swept away in 1349.

Wilton (Wilton, Wilthun) was a seat of the West Saxons and a prosperous town until the removal thence in 1075 of the seat of the bishop of Sherborne to Sarum. The excessive number of markets held at the latter town in the 13th century caused its further decline into a poor and unimportant place. Sweyn burnt and sacked it in 1093, consequently under Edward the Confessor the town was restored, and it was granted to him as a valuable royal borough held in farm by the burgesses for 50. From 1264 onwards Wilton figures in various grants. Richard, earl of Cornwall, obtained it from Henry III., and William, earl of Pembroke, finally from Elizabeth. The first charter given by Henry I. (probably in 1101) granted franchises to the burgesses of the merchant gild and company of Wilton as enjoyed by London and Winchester, and was confirmed by succeeding monarchs from Henry II. to Henry VI. The corporation consisted in 1350 of a mayor, recorder, 5 aldermen, 3 capital burgesses, 17 common burgesses and other officers, one of whom being the returning officer. Two members were returned to parliament from 1293 to 1832 and one from 1832 to 1885, at which date Wilton lost its separate representation. In 1414 Henry V. granted a fair on July 21 and 22. This was cancelled in 1416 and another substituted on July 22 and the three preceding days. Two yearly fairs were obtained by the burgesses from Henry VII. for four days from April 23 and September 1. In 1792 the fair days were November 13, September 12 and May 4; the two latter are still held, that in September being one of the largest sheep fairs in the west of England. Henry III. granted three weekly fairs by on Monday, Wednesday and Friday, and Henry VI., in 1433, one on Wednesday. The latter was still held in 1825, but had ceased in 1888.
WILTSHIRE [Wilt], a south-western county of England, bounded N.W. and N. by Gloucestershire, N.E. and E. by Berkshire, S.E. by Hampshire, S.W. and S. by Devonshire, and W. by Somerset. The area is 1,374 sq. m. A great upland covers two-thirds of the county, comprising, in the north-east, Marlborough Downs, with Savernake Forest; in the centre, the broad undulating sweep of Salisbury Plain; and in the south, the more varied hills and dales of the Nadder watershed, the vale of Chalk and Cranborne Chase. Large tracts of the Chalk are over 600 ft. above the sea, rising in many parts into steep and picturesque escarpments. Several peaks attain an altitude of 900 ft., and Inkpen Beacon, on the borders of Berkshire, Wiltshire and Hampshire, reaches over 1,000 ft. Sutton Poyntz and Avedon Hill are the two highest points in the county. Tertiary clays, called sarsen stones or grey wothers, which were used by the primitive builders of Stonehenge and Avebury. The underlying Greensand is exposed in the deeper valleys of the Chalk, such as the vale of Pewsey, dividing Salisbury Plain from Marlborough Downs, and the vale of Chalk, dividing the Nadder westward from the heights of Cranborne Chase. One of the most charming features of the county is its fertile and well-wooded valleys. Three ancient forests remain: Cranborne Chase, which extends into Dorset; was a royal deer-park as early as the reign of Henry II.; Forest of Dean, which contains no less than 100,000 acres of oak and beeches. The main part of the New Forest belongs to Hampshire; but No Man's Land and Hampshire Common, its outlying heaths and coppices, encroach upon the south-eastern corner of Wilt. Bentley Wood, 5 m. E. of Salisbury, and the Great Ridge and Grovely Woods between the Nadder and Wyle, are fine uplands parks. There is no great sheet of water, but the reservoir near Swindon, and the lakes of Longleat, Stourton and Fonthill in the south-west of Earl Stoke near Westbury, and of Bowood, Corsham and Seagry near Chippenham, have reserve mention for the beauty of their surroundings. The upper reaches of the Thames skirt the north-eastern border, and three other considerable rivers drain the Wiltshire Downs. The Kennet, rising west of Marlborough, winds eastward into Berkshire and meets the Thames at Reading. The Lower or Bristol Avon flows from its source among the Cotteswolds in southern Gloucestershire, past Malmsbury, Chippenham, Melksham and Bradford, where it curves north-eastward into Somerset, finally falling into the Bristol Channel. Besides many lesser tributaries it receives from the south the Frome, which flows for about 15 m. the boundary between Wilt and Somerset. The East or Christchurch Avon, which rises near Bishops Cannings in the centre of the county, flows east and south into Hampshire, and enters the sea at Christchurch. Close to Salisbury it is joined by the united streams of the Nadder and the Wyley; by the Ebbe, which drains the vale of Chalk; and by the Bourne, which flows south by west from its head near Ludgershall.

Geology. — As has been said, about two-thirds of the surface of Wilt is occupied by a great Chalk upland. Cropping out from beneath the Chalk is a fringe of the Selbornian—Upper Greensand and Gault—the former is well exposed in the vale of Pewsey, west of Devizes, and along the margins of the vale of Wardour; it forms a broad, bumpy tract from the Kennet to the Avon. The Gault Clay runs regularly at the foot of the Upper Greensand: it is excavated in several places for brick-making. The Lower Greensand, which oversteps the underlying formations, appears from beneath the Gault at Poulshot and follows the same line of outcrop northwards: a small outlier at Seend is worked for the iron it contains. About one-third of the county lying on the north-west side of the Chalk downs, including a portion of the vale of the White Horse, is occupied by Jurassic rocks. The Upper Lias—the oldest formation in the county—forms the floor of the valley near Box; it is followed by the overlying Inferior Oolite and Fuller's Earth, and by the Greensands, the rocks which furnish the famous building-stones of Bath, quarried at Winsley Down, near Bradford, and at Box, Corsham Down and other places in the neigh- bourhood. Above these are the Greensands, and above the Greensands the London Clay, with the well-known fossil Apcriorius or par-eoncrinite, followed by the Forest Marble limestones and clays. The rubby Combragh crops at Westwood, Trowbridge, and Melksham. Further east lies the outcrop of Oxfordian strata, comprising the sandy Kellaways beds and overlying Oxford Clay, together forming a broad low-lying tract in which stand Trowbridge, Melksham, Chippenham and Cricklade. Rising up from the eastern margin of the Oxfordian vale is the irregular scarps formed by the Corinian oolitic limestones and marls. The iron ores of Westbury are obtained in this formation. Another clay-bottomed vale lies on the eastern side of the Bradford-on-Avon hills, between the Great and Little Malms; and is worked for bricks. It appears also between Seend, Coulston and West- bury; also between Mere and Semley. About the former place it is brought into apposition with Cretaceous rocks through the great east-west fault. At Tisbury and near Poulton the small outcrops of Portlandian rocks which yield the familiar building-stones of Tisbury and Chilkham. Limestone clays of Purbeck age lie in the vale of Wardour about Tettif Vennis. At Dinton in the north-east of the county the Great Beds crop out. In the south-eastern corner of the county there are tracts of Tertiary Reading Beds and London Clay east of Downton and on the Vale of Pewsey, south and east of Marlborough, and south-east of Salisbury. Looking northwards, the name of the Cretaceous rocks which formerly covered the district. Here and there drift gravels and brick earths, besides low-level river gravels, rest upon the older rocks.

Manufactures. — A majority of the hands employed in factories and workshops are occupied in the locomotive works of the Great Western railway at Swindon. There are also large engineering works at Devizes. Cloth is still woven, though in greatly diminished quantities, at Trowbridge, Melksham, Chippenham and other places where water-power is available. Carpets are woven at Warminster, and cloths and coarse flax at Melksham, silk at Malmes- bury, and Mere and Wilmarton. Portland and Bath stone are quarried for building purposes, while iron ore from mines near Westbury is smelted in that town.

Communications. — Three great railway lines traverse Wiltshire from E. to W., throwing out a number of branch lines to the larger towns. In the N. the Great Western main line passes through Swindon on its way from London to Bath. A second line of the same system runs also to Bath from Hungerford, by way of Devizes. South of Salisbury Plain the South-Western main line goes through Salisbury and the southern quarter of Wilt's way into Somerset. The chief branch line is that between Salisbury and Westbury on the Great Western. The Midland & South-Western Junction railway runs north from Andover by Swindon, Cricklade and Cirencester. Swindon, Salisbury and Westbury are the three centres of the county by the large railway system. The goods brought and goods are carried on the Thames & Severn Canal in the N.E., and on the Kennet & Avon Canal across Salisbury Plain. These waterways were formerly connected by a branch of the Berks & Wilts Union Canal, which passed through Berkshire, through Swindon and Melksham, but was closed in 1899.

The area of the ancient county is 879,943 acres, with a population in 1891 of 264,997 and in 1910 of 273,869. The area of the administrative county is 864,105 acres. The county contains 29 hundreds. The municipal boroughs are—Calne (pop. 3,457), Chippenham (5,074), Devizes (6,532), Malmsbury (2,854), Marlborough (3,887), Salisbury, a city and the county town (17,117), Trowbridge (2,872), Wilton (3,008), and Warminster (4,489). Other small towns are Cricklade (1,517), Downton (1,786), Highworth (2,047), Mere (1,077), Pewsey (1,722), Wootton Bassett (2,258). The county is in the western circuit, and assizes are held at Salisbury and Devizes. It has one county court of sessions, and is divided into 16 petty sessional divisions. The boroughs of Devizes and Salisbury have separate courts of quarter sessions and commissions of the peace, and the borough of Marlborough has a separate coronet of sessions. There are 23 civil parishes. Wiltshire is mainly in the diocese of Salisbury, but a considerable part is in that of Bristol, and small parts in those of Gloucester, Oxford and Winchester. It contains 322 ecclesiastical parishes or districts, wholly or in part. The county is divided into five parliamentary divisions, each returning one member—North or Cricklade, North-western or Chippenham, Western or West-
WILTSHIRE

bury, Eastern or Devises and Southern or Wilton. It also contains the parliamentary borough of Salisbury, returning one member.

History.—The English conquest of the district now known as Wiltshire began in 552 with the victory of Cynric at Old Sarum, by which the way was opened to Salisbury Plain. Four years later, pushing his way through the vale of Pewsey, Cynric extended the limits of the West Saxon kingdom to the Marlborough Downs by a victory at Barbury Hill. At this period the district south of the Avon and the Nadder was occupied by dense woodland, the relics of which survive in Cranborne Chase, and the first wave of West Saxon colonization was chiefly concentrated in the Avon and the Wylye, the little township of Wilton which arose in the latter giving the name of Wilsetan to the new settlers. By the 6th century the district had acquired a definite administrative and territorial organization, Walstan, eldestborn of the Wilsetan, being mentioned as early as 800 as repelling an attempted invasion of the Mercians. Moreover, "Wiltunscrei" is mentioned by Asser in 878, in which year the Danes established their headquarters at Chippenham and remained there a year, plundering the surrounding country. In the time of Ethelstan mints existed in Downton, Marlborough, and Wilt;战争是的

At a skirmish at Swanborough in 951, the Earl of Devon in battle, and in 1116 Sarum, at the time of the Domesday Survey, and the office remained hereditary in his family, descending to William Longespee by his marriage with Ela, great-granddaughter of Edward. In the 13th century the assizes were held at Wilton, Malmesbury and New Sarum.

On the division of the West Saxon see in 703 Wiltshire was included in the diocese of Sherborne, but in 905 a separate diocese of Wilton was founded, the see being fixed alternately at Ramsbury, Wilton and Sunning in Berkshire. Shortly after, at the Conquest, the See of Wilton was restored to the See of Sherborne, and the bishopric of Dorchester was made a separate diocese, and by the synod of 1075-1076 the see was transferred to Salisbury. The archdeaconry of Wilts and Salisbury is mentioned in 1180; in 1213 the former included the deaneries of Avebury, Malmesbury, Marlborough and Cricklade within this county, and the latter the deaneries of Amesbury, Poterne, Wilton, Chalke and Wylye. In 1355 the archdeaconry of Salisbury included the additional deanery of Salisbury, while Poterne deanery had been transferred to the archdeaconry of Wiltshire. The deaneries of the archdeaconry of Salisbury have been extensive, and of the archdeaconry now includes the deaneries of Avebury, Marlborough and Poterne, and the deaneries of Chippenham, Cricklade and Malmesbury form part of the archdeaconry and diocese of Bristol.

The inhabitants of Wiltshire have always been addicted to industrial rather than warlike pursuits, and the political history of the county is not remarkable. In 1586, after the completion of the Domesday Survey, Salisbury was the scene of a great council, in which all the landholders took oaths of allegiance to the king, and a council for the same purpose assembled at Salisbury in 1116. At Clarendon in 1166 was drawn up the great Code which remedied the provincial administration of justice. Parliaments were held at Marlborough in 1267, and at Salisbury in 1328 and 1384. During the wars of Stephen's reign Salisbury, Devizes and Malmesbury were garrisoned by Roger, bishop of Salisbury, for the empress, but in 1138 Stephen seized the bishop and captured Devizes Castle. In 1213 Marlborough Castle was surrendered to Louis by Hugh de Neville. Hubert de Burgh escaped in 1263 from Devizes Castle, where he had been imprisoned in the previous year. In the Civil War of the 17th century Wiltshire actively supported the parlia-

mentary cause, displaying a characteristic worth to which and the efforts of the marchers of Hertford and of Lord Seymour to raise a party for the king met with vigorous resistance from the inhabitants. The Royalists, however, made some progress in the early stage of the struggle, Marlborough being captured for the king in 1642, while in 1643 the forces of the earl of Essex were routed by Charles I. and Prince Rupert at Aldbourne, and in the same year Waller, after failing to capture Devizes, was defeated in a skirmish at Roundway Down. The year 1645 saw the rise of the "Clubmen" of Dorset and Wiltshire, whose sole object was peace; they systematically punished any member of either party discovered in acts of plunder. Devizes, the last stronghold of the Royalists, was captured by Cromwell in 1645. In 1653 a rising organized on behalf of the king at Salisbury was dispersed in the same year.

At the time of the Domesday Survey the industrial pursuits of Wiltshire were almost exclusively agricultural; 300 mills are mentioned, and vineyards at Tollard and Lacock. In the succeeding centuries sheep-farming was vigorously pursued, and the Cistercian monasteries of Kingswood and Stanlegh exported wool, while the Extensive and Fisherton markets in the 13th and 14th centuries. Wiltshire at this time was already renowned among the chief of the clothing counties, the principal towns being Bradford, Malmesbury, Trowbridge, Devizes and Chippenham. In the 16th century Devizes was noted for its blankets, Warminster had a famous corn-market, and cheese was extensively made in north Wiltshire. Amesbury was famous for its tobacco pipes in the 16th century. The clothing trade went through a period of great depression in the

Warminster, near South Leigh Wood. The shire court for Wiltshire was held at Wilton, and until 1446 the shrievalty was enjoyed by of the castellans of Old Sarum. Edward, the sheriff of Wiltshire was sheriff at the time of the Domesday Survey, and the office remained hereditary in his family, descending to William Longespee by his marriage with Ela, great-granddaughter of Edward. In the 13th century the assizes were held at Wilton, Malmesbury and New Sarum.

On the division of the West Saxon see in 703 Wiltshire was included in the diocese of Sherborne, but in 905 a separate diocese of Wilton was founded, the see being fixed alternately at Ramsbury, Wilton and Sunning in Berkshire. Shortly after, at the Conquest, the See of Wilton was restored to the See of Sherborne, and the bishopric of Dorchester was made a separate diocese, and by the synod of 1075-1076 the see was transferred to Salisbury. The archdeaconry of Wilts and Salisbury is mentioned in 1180; in 1213 the former included the deaneries of Avebury, Malmesbury, Marlborough and Cricklade within this county, and the latter the deaneries of Amesbury, Poterne, Wilton, Chalke and Wylye. In 1355 the archdeaconry of Salisbury included the additional deanery of Salisbury, while Poterne deanery had been transferred to the archdeaconry of Wiltshire. The deaneries of the archdeaconry of Salisbury have been extensive, and of the archdeaconry now includes the deaneries of Avebury, Marlborough and Poterne, and the deaneries of Chippenham, Cricklade and Malmesbury form part of the archdeaconry and diocese of Bristol.

The inhabitants of Wiltshire have always been addicted to industrial rather than warlike pursuits, and the political history of the county is not remarkable. In 1586, after the completion of the Domesday Survey, Salisbury was the scene of a great council, in which all the landholders took oaths of allegiance to the king, and a council for the same purpose assembled at Salisbury in 1116. At Clarendon in 1166 was drawn up the great Code which remedied the provincial administration of justice. Parliaments were held at Marlborough in 1267, and at Salisbury in 1328 and 1384. During the wars of Stephen's reign Salisbury, Devizes and Malmesbury were garrisoned by Roger, bishop of Salisbury, for the empress, but in 1138 Stephen seized the bishop and captured Devizes Castle. In 1213 Marlborough Castle was surrendered to Louis by Hugh de Neville. Hubert de Burgh escaped in 1263 from Devizes Castle, where he had been imprisoned in the previous year. In the Civil War of the 17th century Wiltshire actively supported the parlia-

mentary cause, displaying a characteristic worth to which and the efforts of the marchers of Hertford and of Lord Seymour to raise a party for the king met with vigorous resistance from the inhabitants. The Royalists, however, made some progress in the early stage of the struggle, Marlborough being captured for the king in 1642, while in 1643 the forces of the earl of Essex were routed by Charles I. and Prince Rupert at Aldbourne, and in the same year Waller, after failing to capture Devizes, was defeated in a skirmish at Roundway Down. The year 1645 saw the rise of the "Clubmen" of Dorset and Wiltshire, whose sole object was peace; they systematically punished any member of either party discovered in acts of plunder. Devizes, the last stronghold of the Royalists, was captured by Cromwell in 1645. In 1653 a rising organized on behalf of the king at Salisbury was dispersed in the same year.

At the time of the Domesday Survey the industrial pursuits of Wiltshire were almost exclusively agricultural; 300 mills are mentioned, and vineyards at Tollard and Lacock. In the succeeding centuries sheep-farming was vigorously pursued, and the Cistercian monasteries of Kingswood and Stanlegh exported wool, while the Extensive and Fisherton markets in the 13th and 14th centuries. Wiltshire at this time was already renowned among the chief of the clothing counties, the principal towns being Bradford, Malmesbury, Trowbridge, Devizes and Chippenham. In the 16th century Devizes was noted for its blankets, Warminster had a famous corn-market, and cheese was extensively made in north Wiltshire. Amesbury was famous for its tobacco pipes in the 16th century. The clothing trade went through a period of great depression in the
17th century, partly owing to the constant outbreaks of plague. Linen, cotton, gloves and cutlery were also manufactured in the county, silk at Malmsbury and carpets at Wilton.

In 1295 Wiltshire was represented by no less than twenty-eight members in parliament, the shire returning two knights, and the boroughs of Bedwyn, Bradford, Calne, Chippenham, Cricklade, Devizes, Down, Lurgashall, Malmesbury, Marlborough, Old Sarum, Salisbury and Wilton, two burgesses each, but the boroughs for the most part made very irregular returns. Hindon, Heytesbury and Wootton Bassett were disfranchised in the sixteenth century. Act 1 and 2 Henry I of 1533, the county with sixteen boroughs returned a total of thirty members. Under the latter Act Great Bedwin, Downon, Heytesbury, Hindon, Lurgashall, Old Sarum and Wootton Bassett were disfranchised, and Calne, Malmesbury, Westbury and Wilton lost one member each. Under the act of 1868 the county returned two members in two divisions, and Chippenham, Devizes and Marlborough lost one member each. Under the act of 1858 the county returned five members in five divisions; Cricklade, Calne, Chippenham, Devizes, Malmesbury, Marlborough, Westbury, and Wilton were disfranchised; and Salisbury lost one member.

**Antiquities.**—Wiltshire is extraordinarily rich in prehistoric antiquities. The stone age is represented by a number of flint stone implements, preserved in the unsurpassed collection at Salisbury Museum, and by the remains of large stone circles, with avenues of monoliths leading to a central stone circle; and the stone circle, surrounded by an earthwork, and enclosing two lesser circles, are the largest and most famous megalithic works in England. A valley near Avebury is filled with immense sarsen blocks, resembling a river of stone, and perhaps laid there by prehistoric architects. There are also menhirs, dolmens and cromlechs. Surrounding the woods of forests and marshy hollows, it is clear that the downs were densely peopled at a very early period. Circular enclosures, formed by a ditch within a bank, are common, as are grave-mounds or barrows. These have been classified according to their shape as cremation barrows; round barrows, or barrows enclosing cemeteries of stone circles; and barrows; tools, weapons and ornaments have been dug up from such mounds, many of which contain kistvans or chambers of men. The 'lynches' or terraces which score some of the hillsides are said to be the work of primitive agriculturists. Ancient strongholds and manor-houses are also numerous; and there are vestiges of others on Salisbury Plain and Marlborough Downs.

There are many signs of the Roman rule. Wans Dyke or Woden's Dyke, a most remarkable earthwork, runs westward from near Devizes, 60 m. from a point east of Savernake, nearly as far as the Bristol Channel, and is almost unaltered for several miles along the Marlborough Downs. Its date is uncertain; but the work has been proved, wherever excavated, to be Roman or Roman-British. It consists of a bank, with a trench on the north side, and was clearly meant for defence, not as a boundary. Forts strengthened it at intervals. Bokerly Dyke, which forms a part of the boundary between Wilts and Dorset, is the largest among several similar entrenchments, and has also a ditch north of the rampart.

Chief among the few monastic buildings of which any vestiges remain are the abbeys of Malmesbury, Downon and of the Priory of Melksham. There are some traces of the hospital for leprous women afterwards converted into an Austin priory at Maiden Bradley. Monkton Farleigh, farther north along the Somerset border, had its Cistercian priory with a chapter house and cloisters, represented by some outbuildings of the manor-house. A college for a dean and 12 prebendaries, afterwards a monastery of Bon-hausen, was transferred from Bad Langensalza, in 1465, and, and Perpendicular, resembles a cathedral in size and stately beauty. The 14th century buildings of Bradenstoke Priory or Clock Abbey, founded near Chippenham for Austin canons, are incorporated in a farmhouse. The finest churches of the 15th century, Perpendicular, were built in the districts where good stone could be obtained, while the architecture is more simple in the Chalk region, where flint was used. Steeples and pyramidal bell-turrets are not uncommon; and the churches have a nave, 31 m. N.W. of Swindon, and Wansboro, 3 m. S.E., have each two steeples, one in the centre, one at the west end. St Lawrence's church at Bradford-on-Avon is one of the most perfect Saxon ecclesiastical buildings in England; and elsewhere there are fragments of Saxon work imbedded in later buildings. There are three arches in the nave of Britford church, within a mile of Salisbury; the east end of the chancel at Burcombe, near Wilton; and parts of several churches at Byford, Bradford, and Bruce or Brooke in the vale of Pewsey. St John's at Devizes is on the site of a Norman tower and has Norman masonry in its chancel; while the chancel of St Mary's, in the same town, is also Norman, and the populous character of the early churches at Chiswell, near Marlborough, Dittoner and Ditchidge, near Southrop, and Nether Avon, near Amesbury, preserve sundry Norman features.

Wimbledon (Wibbandune) is suggested to have been the scene of a battle in 566 between Cæwin, king of Wessex, and Æthelberht, king of Kent, in which Æthelberht was defeated, and an earthwork which existed on the Common may have marked the site. At
Coombes's Hill and elsewhere British relics have been found. At Domesday Wimbledon formed part of the manor of Mortlake, held by the archbishops of Canterbury. Afterwards the name was sometimes used interchangeably with Mortlake, and in 1341 it is described as a grange or farm belonging to Mortlake. On the impeachment of Arundel, archbishop of Canterbury, in 1348, it was confiscated. In the reign of Henry VIII. Cromwell, earl of Essex, held the manor of Wimbledon, with Bristow Park as an appanage. On the confiscation of Cromwell's estates in 1540 it again fell to the crown, and by Henry VIII. it was settled on Catherine Parr for life. By Queen Mary it was granted to Cardinal Pole. In 1574 Elizabeth bestowed the manor-house, while retaining the manor, on Sir Christopher Hatton, who sold it the same year to Sir Thomas Cecil. In 1588 Elizabeth transferred the manor to her son Sir Edward Cecil, in exchange for an estate in Lincolnshire. At the time of the Civil War the manor was sold to Adam Baynes, a Yorkshireman, who shortly afterwards sold it to General Lambert; and at the Restoration it was granted to the queen dowager, Henrietta Maria, who sold it in 1661 to George Digby, earl of Bristol. On his death in 1676 it was sold by his widow to the lord-treasurer Danby. Some years after Danby's death it was purchased by Sarah, duchess of Marlborough, who bequeathed it to her grandson, John Spencer. It was sold by the fifth Earl Spencer in 1877. Wimborne was bought by Sir Henry John Spencer, 1st baronet, and replaced by another building in 1735 by the duchess of Marlborough; this was destroyed by fire in 1785, and a new house, called Wimledon Park House, was erected about 1801. Wimbledon was incorporated in 1905.

WIMBORNE (Wimborne Minster), a market town, in the eastern parliamentary division of Dorsetshire, England, 1113 m. S.W. by W. of London from the London & Southern railway; served also by the Somerset and Dorset railway. Pop. of urban district (1901) 3636. It is situated on a gentle slope about 400 ft. S.W. of the Minster. The church or minster of St Cuthberga is a fine cruciform structure of various styles from Early Norman to Perpendicular, and consists of a central lantern tower, nave and choir with aisles, transepts without aisles, western or bell tower, north and south porches, crypt and vestry or sacristy, with the library over it. It contains a large number of interesting monuments, including a brass with the date 873 (supposed to mark the resting-place of King Æthelred I.), a lunar ory of the 14th century and an octagonal Norman font of Purbeck marble. There is a church dedicated to St John the Evangelist. The manor house, occupied in occasion of the visits of the Elizabethan sovereigns. Near Wimborne is Canford Manor, the seat of Lord Wimborne, a mansion in the Tudor style, built by Blore in 1586, and improved from designs of Sir Charles Barry. The town depends chiefly on agriculture; but the manufacture of hose is carried on to a small extent, and there are also coachbuilding works.

Although Wimborne (Wim'burn) has been identified with the Vindoladis of the Antonine Itinerary, the first undisputed evidence of settlement is the entry of the Anglo-Saxon Chronicle, under the date 718, that Cuthhur, sister of King Ine, founded the abbey here and became the first abbess; the house is also mentioned in a somewhat doubtful epistle of St Aldhelm in 705. The importance of the foundation made it the burial-place of King Æthelred in 871, and of King Siffterth in 862. Æthelwulf seized and fortified Wimborne in his revolt in 891 against Edward the Elder. The early abbey was probably destroyed by the Danes in the reign of Æthelred the Unready (978-1013), for in 1043 Edward the Confessor founded here a college of secular canons. The college remained unaltered until 1496, when Margaret, countess of Richmond, obtained letters patent from her son, Henry VII., to found a chantry in connexion with which she established a school. The continuance of this was recommended by the commissioners of 1547, and in 1562 Elizabeth vested a great part of the property of the former college in a school corporation of twelve governors, who had charge of the church. New charters for the school were obtained from James I. in 1582 and from Charles I. At the conquest Wimborne was a royal borough, ancient demesne of the crown, and part of the manor of Kingston Lacy, which Henry I. gave to Robert Mellent, earl of Leicester. From him it descended by marriage to the earls of Lincoln, and, then passing by marriage to Earl Thomas of Lancaster, became the seat of the duchy of Lancaster; an inquisition of 1352 found that Henry, duke of Lancaster, had 735. 3d. rent of assize in the borough of Wimborne. The borough is again mentioned in 1487-1488, when John Plecy held six messuages in free burgage of the king as of his borough of Wimborne, but it seems to have been entirely prescriptive, and was never a parliamentary borough. The town was governed until the 16th century by two bailiffs, chosen annually at a court leet of the royal manor of Wimborne borough, part of the manor of Kingston Lacy. The market held here on Friday of each week is not mentioned in Domesday Book, but seems to be of early origin. Wimborne carried on considerable manufactures of linen and woollen goods until the time of Charles II., when they declined, their place being taken by the stocking-knitting industry of the 18th century. See John Hutchins, The History and Antiquities of the County of Dorset (3rd edition, Westminster, 1861); Anon., History of Wimborne (London, S.0.).

WIMPPffen, EMMANUEL FELIX DE (1811-1884), French soldier. Entering the army from the military school of St Cyr, he saw considerable service in Algeria, and in 1840 became captain, in 1847 chef de bataillon. He first earned marked distinction in the Crimean War as colonel of a Turco regiment, and his conduct at the storm of the Mamelon won him the grade of general of brigade. In the campaign of 1859 he was with General MacMahon at Magenta at the head of a brigade of Guard Infantry, and again won promotion on the field of battle. Between this campaign and that of 1870 he was mainly employed in Algeria, and was not at first given a command in the ill-fated "Army of the Rhine." But when the earlier battles revealed incapacity in the commander of the 5th corps, De Wimpffen was ordered to take it over, and was given a dormant command appointing him to command the Army of Châlons in case of Marshal MacMahon's disablement. He only arrived at the front in time to rally the fugitives of the 5th corps, beaten at Beaumont, and to march them to Sedan. In the disastrous battle of the 1st of September, MacMahon was soon wounded, and the senior officer, General Ducrot, assumed the command. Ducrot was beginning to withdraw the troops when Wimpffen produced his commission and countermanded the order. In consequence it fell to him to negotiate the surrender of the whole French army. After his release from captivity, he lived in retirement at Algiers, and died at Paris in 1884. His later years were occupied with polemical discussions on the surrender of Sedan, the responsibility for which was laid upon him.

WINDBORN, amongst other works, Sedan (1876) La Situation de la France, et les réformes nécessaires (1873) and La Nation armée (1875).

WINBURG, a town in the Orange Free State, 90 m. N.E. by rail of Bloemfontein. Pop. (1904) 2762, of whom 1003 were whites. It is built by the banks of a tributary of the Vet affluent of the Vaal, and is a trading centre for a large grain and pastoral district. It is joined to the trunk line from Pretoria to the Transvaal by a branch line from Smalldeel, 28 m. N.W. The town was founded in 1837 by Commandant H. Potgieter, one of the voortrekkers, and was named by him in commemoration of a victory gained over the Matabele chief Mosilikatze. It became the capital of a quasi-independent Boer state, which included considerable areas north of the Vaal. In 1848 the town and district were annexed to Great Britain and thereafter followed the fortunes of the Orange river sovereignty (see ORANGE FREE STATE). In the Boer War of 1899-1902 Winburg was one of the Boer centres in the guerrilla fighting which followed the fall of Pretoria.

WINCHCOMB, a market town in the northern parliamentary division of Gloucestershire, England, 7 m. N.E. of Cheltenham. Pop. (1901) 2864. It is picturesquely situated among the Coteswold Hills, in the narrow valley of the Isbourne stream. The Perpendicular church of St Peter, cruciform, with a central
tor, is a good example of its period. In the vicinity is Sudeley Castle, originally built by Thomas Boteler, Lord Sudeley (d. 1398). By gift of Edward VI. it came into the hands of Sir Thomas Seymour, fourth husband of Catherine Parr; this queen died here and was buried in the chapel. The castle suffered severely at the hands of the parliamentarians in 1644, and remained ruinous until 1837, when a careful restoration was begun. There are a tower of the 14th century, and considerable remains of the 15th, the inhabited portion being mainly of Tudor date. There are four mills, paper-works and tanneries at Winchcombe.

Excavations prove that there were both British and Roman settlements at Winchcombe (Winchelcumbe, Winchelcume). It owed its growth to the foundation of religious houses by Offa and Coenwulf of Mercia in the 8th century. It became a borough in Saxon times, was the chief town of a shire to which it gave its name, and was the seat of government of the Mercian kings. Witenagemots were held here in 771 and 942. Harold, earl of Wessex, was the first overlord. It had become a royal borough by 1087, and was granted by charter of 1224 to the abbots of St Mary's to be held of the king by a rent of 250. Winchcombe never received a charter, and was not incorporated, but as a borough by prescription it was governed by 2 bailiffs and 10 chief burgesses until the corporate body was dissolved by act of parliament in 1883. It was never represented in parliament except by its mitred abbots before the dissolution of the monasteries. There is no trace of the original grant of a fair on July 17 (now held on July 28), but it is mentioned as already existing in a charter of 1223, which changed the market day from Sunday to Saturday. Elizabeth granted another fair on April 25 by charter in 1575. A Tuesday market was also granted under this charter, but the Saturday market only is now held. Both the modern fairs are horse and cattle fairs, but in the middle ages they were centres of the cloth manufacture. Tanning has been a local industry since the beginning of the 19th century, and paper and silk factories were introduced about 1830. Winchcombe took the site of the king in the Civil War and was twice plundered.

See Victoria County History, Gloucestershire: Emma Dent, Annals of Winchcombe (1877); David Royce, Winchcombe Cartulary (1892).

WINCHELSEA, ANNE FINCH, COUNTESS OF (1661–1720), English author, daughter of Sir William Kingsmill of Sidnonton, near Southampton, was born in April 1661. Five months later her father died, and her mother married in 1662 Sir Thomas Ogle. Lady Ogle died in 1664, and nothing is heard of her daughter Anne until 1683, when she is mentioned as one of the maids of honour of Mary of Modena, duchess of York. She married in May 1684 Colonel Henecage Finch, who was attached to the duke of York's household. To him she addressed poems and versified epistles, in which he figures as Daphnis and she as Ardea. At the Revolution Heneage Finch refused the oath of allegiance to William and Mary, and he and his wife had no fixed home until they were invited in 1666 to Eastwell Park, Kent, by Finch's nephew Charles, 4th earl of Winchelsea, on whose death in 1712 Heneage Finch succeeded to the carldom. The countess of Winchelsea died in London on the 5th of August 1720, leaving no issue, her husband surviving until 1726.

Lady Winchelsea's poems contain many copies of verse addressed to her friends and contemporaries. She was to some extent a follower of the "matchless Orinda" in the fervour of her friendships. During her lifetime she published her poem "The Spleen" in Gildon's Miscellany (1701) and a volume of Poems in 1713 which included a tragedy called Aristomenes. With Alexander Pope she was on friendly terms, and one of the seven commendatory poems printed with the 1717 edition of his works was by her. But in the farce Three Hours after Marriage (1717) attributed to Gay, but really the work of Pope, Arbuthnot and Gay, she is ridiculed as the learned lady, Phoebe Clinket, a character assigned to Pope's hand. Lady Winchelsea's poems were almost forgotten when Wordsworth in the "Essay, supplementary to the Preface" of his Poems (1821), drew attention to her nature-poetry, asserting that with the exception of Pope's "Windsor Forest" and her "Nocturnal Reverie," English poetry between Paradise Lost and Thomson's Seasons did not present "a single new image of external nature." Wordsworth sent at Christmas 1819 a MS. of extracts from Lady Winchelsea and other writers to Lady Mary Bowther, and her correspondence with Alexander Dyce contains some minute criticism and appreciation of her poetry.

Mr Edmund Goss wrote a notice of her poems for T. H. Ward's English Poets (vol. iii., 1880), and in 1884 came into possession of a volume of her early poems, some of which he printed in The Poems of Anne, Countess of Winchelsea, was edited by Myra Reynolds (Chicago, 1903) with an exhaustive essay. See also E. Goss, "Edmund Goss and the Winchescians," in E. and E. D. Hoey, Modern and Elizabethan. Wordsworth's anthology for Lady Mary Lister was first printed in 1905 (Oxford). Some of her work remains in MS. in the possession of Professor Dowden.

WINCHELSEA, ROBERT (d. 1313), archbishop of Canterbury, was probably born at Old Winchelsea. He studied and then taught at the universities of Paris and Oxford, where he attained celebrity as a scholar, and became rector of the former, and subsequently chancellor of the latter university. He held several positions in the cathedrals of Lincoln and Canterbury, and was made archdeacon of Essex about 1283. In December 1292 John Peckham, archbishop of Canterbury, died, and early in the following year Winchelsea was elected as his successor. His consecration, which took place at Aquila in September 1294, was delayed owing to the vacancy in the papacy, but he found no difficulty in obtaining the temporalities of the see from King Edward I. Winchelsea is chiefly renowned as a strenuous upholder of the privileges of the clergy and the authority of the pope, and as a fearless opponent of Edward I. Strengthened by the issue of the papal bull Claritas laevis in 1296, he stimulated the clergy to refuse pecuniary assistance to Edward in 1297; but after the king had pronounced sentence of outlawry against the delinquents he instructed each clerk to decide this question for himself. Personally the archbishop still declined to make any contribution towards the expenses of the French war, and his lands were seized and held by Edward until July 1297, when a somewhat ostentatious reconciliation between king and prelate took place at Westminster. He took some part in the movement which led to the confirmation of the charters by royal assent in 1298, but in the struggle with the king he did not exhaust his energies. He asserted his authority over his suffragans to the full; quarrelled with Pope Boniface VIII. over the presentation to a Sussex living, and was excommunicated by one of the pope's minions; and vigorously contested the claim of the archbishop of York to carry his cross erect in the province of Canterbury. Before these events, however, the quarrel with Edward had been renewed, although Winchelsea officiated in 1299 at the king's marriage with Margaret, daughter of Philip III., king of France. Joining the barons in demanding certain reforms from Edward at the parliament of Lincoln in 1301, he compelled the king to give way on the main issues; but the indignation which followed the claim of Pope Boniface to be the protector of Scotland, a claim which was supported by Winchelsea, led to the rupture of this alliance. It is probable that one of the reasons which led the archbishop to join in these proceedings was his hostility to Edward's adviser, Walter Langton, bishop of Lichfield, whom he sought to disgrace both in England and at Rome. The king cherished his indignation until his friend Clement V. became pope in 1305, when he made his fierce move against Winchelsea, listening to Edward's agents, Langton and Henry Lacy, earl of Lincoln, Clement suspended the archbishop, who, after vainly imploring the intercession of the king, left England and journeyed to the papal court at Bordeaux, remaining in exile until Edward's death in July 1307. The new king, Edward II., requested Clement to allow Winchelsea to return to his see. The pope assented, but soon after his return to England early in 1306 the archbishop joined the king's enemies; even demanded the release from prison of his old enemy, Langton, and was one of the "ordinaries" appointed in 1310. He assisted the barons in their struggle
WINCHELSEA—WINCHESTER, EARLS AND MARQUESSES OF

with Edward II. by a frequent use of spiritual weapons, and took part in the proceedings against the Templars. He died at Otford on the 11th of May 1313. Miracles were said to have been worked at his tomb in Canterbury cathedral, but efforts to procure his canonization were unavailing. Although a secular priest Winchel- sen was somewhat ascetic, and his private life was distinguished for sanctity and generosity. As an ecclesiastic, however, he was haughty and fond of power; and he has been not inappropriately described as "the greatest churchman of the time."

WINCHELSEA, a village in the Rye parliamentary division of Sussex, England, 9 m. N.E. by E. from Hastings by the South Eastern and Chatham railways. Pop. (1901) 670. It stands on an abrupt hill-spur rising above flat lowlands which form a southward continuation of Romney marsh. This was within historic times a great inlet of the English Channel, and Winchelsea was a famous seaport until the 15th century. Two gates, one of the time of Edward I., the other erected early in the 15th century, overlooked the marshes; a third stands at a considerable distance west of the town, its position pointing the contrast between the extent of the ancient town and that of the shrunken village of to-day. The town walls were laid out during the reign of Edward I., and streets were intersecting at right angles; the form is preserved, and in a picturesque open space in the centre stands the church of St Thomas à Becket. This comprises only the chancel and aisles of a building which, if entire, would rank as one of the finest parish churches in England. As it stands it is of the highest interest, showing remarkable Decorated work, with windows of beautiful and unusual design, and a magnificent series of canopied tombs. In the grounds of the residence called the Friars stands the shell of the apsidal choir of a Decorated chapel which belonged to a Franciscan house. Of a Dominican convent and other religious foundations and churchyards remains.

The town of which the relics have been described was not the first of its name. On a site supposed to be about 3 m. S.E., and now therefore about 1½ m. out in the English Channel, a seaport had grown up on a low peninsula. In 1236 and at various subsequent dates in the same century this town suffered severely from encroachments of the sea, and in 1266 it paid the penalty for its adherence to the cause of Simon de Montfort. The waves finally obliterated the site in 1288, and Edward I. thereafter planted the new town in a safe position. In the 14th and 15th centuries Winchelsea was frequented by the French, and in Edward III. defeated the Spanish in a naval action close by.

In the time of the Confessor Winchelsea (Winchesel, Winchelze, Wynclese) was included in Rameslie which was granted by him to the abbey of Fécamp. The town remained under the lordship of the abbey until it was resumed by Henry III. Its early importance was due to its harbour, and by 1266 it was probably already a port of some consequence. By the reign of Henry II., if not before, Winchelsea was practically added to the Cinque Ports and the jurisdiction of their liberties extended over the town; New Winchelsea, a walled town, flourished for about a hundred years and provided a large proportion of the ships furnished by the Cinque Ports to the crown; but the ravages of the French destroyed it, its walls were broken down, and the decay of the harbour, owing to the recession of the sea, prevented any later return of its prosperity. The corporation, which in 1298 included a mayor, barons and bailiffs, was dissolved by an act of 1883.

Winchelsea as a Cinque Port was summoned to parliament in 1264-1266 and returned two members from 1356 till 1382, when it was disfranchised. The abbé of Fécamp seems to have originally held a market. In 1792 a market was held on Saturdays and a fair on the 14th of May, but this market or fair now exists. In 1660 building and fishing were carried on in the 14th and 15th centuries. In later years Winchelsea became a great resort for smugglers, and the vaults originally constructed for the Gascon wine trade were used for storing contraband goods.

WINCHESTER, EARLS AND MARQUESSES OF. The title of earl of Winchester was first borne by Saier, or Seer, de Quincy, who was endowed by King John on the 13th of March 1207, with the earldom of Winchester, or the county of Southampton. Saier de Quincy was one of the twenty-five barons named to enforce the observance of the Great Chancery, master of the swords at the siege of Damietta in 1219, and died soon afterwards, probably on the 3rd of November of that year. His second son Roger de Quincy (c. 1195-1264), who is said to have usurped the earldom during the absence of his elder brother Robert in the Holy Land, took part in the struggle between Henry III. and the barons. He died without male issue in April 1264, and the earldom reverted to the crown. It was revived in 1322 in favour of Hugh le Despenser, favourite of King Edward II., and was forfeited when he was put to death by the barons as a traitor in 1326. In 1472 the title, together with a pension of £500 a year from the customs of Southampton, but not the right of sitting in parliament, was given by King Edward IV. to a Burgundian, Louis de Bruges, lord of Gruthuse and prince of Stenhuysen, as a reward for services rendered to himself while an exile on the continent. Louis de Bruges surrendered his patent to Henry VII. in 1499.

The marquessate of Winchester was created in 1551 in favour of William Pawlet, or Pawlel, K.G., a successful courtier during four reigns, who died on the 10th of March 1572. It has descended in the male line of his family to the sixteenth possessor. John Pawlet, 2nd marquess (1557-1576), was created earl of Winchester and viscount Hinton at the death of his father, with the life of his father, a distinction which was shared by his three immediate successors—William Pawlet (c. 1555-1599), William Pawlel (c. 1600-1628) and John Pawlel (c. 1598-1674). Charles Pawlet, son and heir of John Pawlel, the eighth marquess, was created duke of Bolton, on the 9th of April 1689, and the marquessate of Bolton remained in connexion with the duchy of Bolton (q.v.) till the death of Harry Pawlel, sixth duke and eleventh marquess, without male issue in December 1794. There being no male representative of the dukes of Bolton this title passed, on the death of Lord Hinton Pawlel, created Marquess of Winchester and always confined to the younger branches of the family, to Sir Henry Paulet, of Long House, Shillingford, near Chesham, Buckinghamshire, 6th or 7th son of the fourth marquess. He married in 1740 Caroline, daughter of Sir John Hinton, of Long House, in the county of Buckingham, and with his wife resided at Long House, Buckinghamshire, where he died in 1808. Lord Hinton Pawlel, 7th marquess, was the eldest son of the fourth marquess, by his first marriage with Alice Viscountess Latimer, daughter of Edward Viscount Latimer, and younger daughter of Lord Latimer, of Long, Sussex, who died in 1777.

Three of the marquesses of Winchester were men of note. It is recorded of the founder of the family, William Pawlel, that when asked how he had contrived to live through a long period of troubled times during four reigns, he replied that he came of the willow and not of the oak, ortus sum e salice non ex quercu. This saying, repeated by Sir Robert Naunton in his Fragmenta regalia, may possibly not have been due to the marquess himself, but if not it was well invented and lived through many dangers and always contrived to keep, or to place himself in the good graces of his king, who always followed in the passage by his brother, Henry William Montague Pawlel (b. 1862).

Of the three marquesses of Winchester were men of note. It is recorded of the founder of the family, William Pawlel, that when asked how he had contrived to live through a long period of troubled times during four reigns, he replied that he came of the willow and not of the oak, ortus sum e salice non ex quercu. This saying, repeated by Sir Robert Naunton in his Fragmenta regalia, may possibly not have been due to the marquess himself, but if not it was well invented and lived through many dangers and always contrived to keep, or to place himself in the good graces of his king, who always followed in the passage by his brother, Henry William Montague Pawlel (b. 1862).
co-operated with the king in carrying out the separation of the Church from Rome between 1520 and 1536. He served on the courts which tried Sir Thomas More and Anne Boleyn, and he was employed to tell Catherine of Aragon that she and her daughter were degraded from their rank. It is characteristic of the type of man that he did his work gently, and with a constant recollection of the changes of fortune. His personal kindness to Anne Boleyn, which she acknowledged, no doubt stood him in good stead on the accession of her daughter Queen Elizabeth. In 1538 he was created Lord St John, and he was enriched by a grant of the lands of Netley Abbey, near Southampton. He was appointed lord steward of the household, and lord chamberlain, and became a knight of the garter in 1543. Henry VIII, named him one of the council, and gave his approval, for it was his wise rule to show just as much independence as enhanced the merit of his obedience. He was lord treasurer under Mary, and kept his place under Elizabeth, to whose ecclesiastical policy he gave his usual discreet opposition and final obedience. Winchester died at his house of Basing on the 10th of March 1572. He had built it on so grand a scale that his descendants are said to have found it necessary to pull down a part. He married, first Elizabeth, daughter of Sir William Capel, Lord Mayor of London, by whom he had four sons and four daughters, and then Winifred, daughter of Sir John Bruges, alderman of London, and widow of Sir Richard Scaxville, by whom he had no children. It is said that one hundred and three of his descendants were alive at the date of his death.

His grandson, William Paulet, third marquess (c. 1535–1598) was one of the judges of Mary, queen of Scots, and author of a book called The Lord Marquesses Idleness which contains a Latin acrostic of extreme ingenuity on the words Regina nostra Angliae.

The fifth marquess, John Paulet (1628–1674), was a Roman Catholic. He lived much in retirement in order to be able to pay off debts left by his father. He is remembered by the arbour and sincerity of his loyalty to King Charles I. It is said that he caused the words "Aimez Loyauté" to be engraved on every pane of glass in his house of Basing. During the first Civil War it was fortified for the king, and stood a succession of sieges by the parliamentary forces between 1643 and 1645. On the 14th of October 1645, it was stormed by Oliver Cromwell. The marquess, who fought valiantly, told Hugh Peters, chaplain of the New Model Army of the parliament, who had the vulgarity to crow over him, "That if the king had no more ground in England but Basing House, he would adventure as he did, and so maintain it to the utmost," for "that Basing House was called Loyalty." The house caught fire during the storm and was burnt down, the very ruins being carried away by order of the parliament. The marquess was imprisoned in the Tower of London, but was finally allowed to compound for his estate; after the restoration of King Charles II. he was promised compensation for his losses, but nothing was given to him. He died in Englefield Park on the 4th of March 1674, unmarried, first to Jane, daughter of Viscount Savage, by whom he had one son; then to Honora de Burgh, daughter of Richard, earl of St Albans and Clancaride, by whom he had four sons; and then to Isabel Howard, daughter of Viscount Stafford.

the most notable are the monuments of Bishops Edington, Wykeham, Waynflete, Cardinal Beaufort, Langton and Fox. The door of iron grills, of beautiful design, now in the north nave aisle, is considered to be the oldest work of its character in England; its date is placed in the 12th Early English style. The mortuary chests in the presbytery contain the bones of Saxon kings who were buried here. The remains were collected in this manner by Bishop Henry de Blois (1120–1171), and again after they had been scattered by the soldiers of Cromwell. The choir stalls furnish a magnificent example of Decorated woodwork, and much stained glass of the Decorated and Perpendicular periods remains in fragmentary form. The library contains a Vulgate of the 12th century, a finely ornamented MS. on vellum.

In 1905 serious signs of weakness were manifested in the fabric of the cathedral, and it was found that a large part of the foundation was insecure, being laid on piles, or tree-trunks set flat, in soft and watery soil. Extensive works of restoration, including the underpinning of the foundations with cement concrete (which necessitated the employment of divers), were undertaken under the direction of Mr T. G. Jackson.

Relics of the monastic buildings are slight, and there are Early English arches and Perpendicular work in the deanery. Other old houses in the Close are very picturesque. Here formerly stood the house which Charles II. desired of Ken for Nell Gwyn. Ken refused it, but the king bore no malice, setting Nell Gwyn in another house near by, and afterwards raising Ken to the bishopric of Bath and Wells.

King Alfred founded a minster immediately north of the present site of the cathedral, and here he and other Saxon kings were buried. The house, known as Hyde Abbey, was removed (as was Alfred’s body) to a point outside the walls considerably north of the cathedral, during the reign of Henry I. Here foundations may be traced, and a gateway remains. To the east of the cathedral are ruins of Wolvesey Castle, a foundation of Henry de Blois, where the bishops resided. On the southern outskirts of the city, in a pleasant meadow by the Itchen, is the Hospital of St Cross. This also was founded by Henry de Blois, in 1156, whose wish was to provide board and lodging for 13 poor men and a daily dinner for 100 others. It was reformed by William of Wykeham, and enlarged and mostly rebuilt by Cardinal Beaufort (1403-1447). The buildings form three sides of a quadrangle, with a lawn and sun-dial in its midst; while the fourth side is partly open, and partly formed by the magnificent cruciform church. The earliest parts of this building are late or transitional Norman, but other parts are Early English or Decorated. The work throughout is very rich and massive. St Cross is a unique example of a medieval almshouse, and its picturesque is enhanced by the curious costume of its inmates. It is still customary to provide a dole of bread and beer to all who desire it. The parish churches of Winchester are not of special interest, but the church of St Swithin is curious as occupying the upper part of the King’s Gate. This gate and the West Gate alone remain of the gates in the walls which formerly surrounded the city. The West Gate is a fine structure of the 13th century. In the High Street stands the graceful Perpendicular city cross. The county hall embodies remains of the Norman castle, and in it is preserved the so-called King Arthur’s round table. This is supposed to date actually from the time of King Stephen, but the painted designs upon it are of the Tudor period.

Winchester is famous as an educational centre, and in addition to Winchester College there are several modern preparatory schools here. The College of St Mary, lying to the south of the cathedral close, is one of the greatest of English public schools. While a monastic school was in existence here from very early times, the college was originated in 1387 by William of Wykeham, whose famous scheme of education embraced this foundation and that of New College, Oxford. The members on the foundation consisted of a warden, 10 fellows, 3 chaplains, 70 scholars and 16 choristers. The buildings were completed about 1395. The quadrangles, with the fine chapel, tower, hall and cloister are noteworthy, and there are extensive modern buildings.

The principal public buildings of the city are the gild-hall, public library and art school, museum, market house, mechanics’ institute, and barracks. The parliamentary borough returns one member and falls within the Andover division of the county. The corporation consists of a mayor, 6 aldermen and 18 councillors. Area, 1931 acres.

History.—The history of the earliest Winchester (Winton, Wyntun) is lost in legend; tradition ascribes its foundation to Ludor Rous Hudibras and dates it ninety-nine years before the first building of Rome; earthworks and relics show that the Itchen valley was occupied by Celts, and it is certain from its position at the centre of six Roman roads and from the Roman name that Winchester must have been a Roman town. The name is under the name of Venta Belgarum, an important Roman-British country town. Hardly any traces of this survive, but mosaic pavements, coins, &c., have been discovered on the south side of High Street. The name of Winchester is indissolubly linked with that of King Arthur and his knights, but its historical greatness begins when, after the conquest of the present Hampshire by the Gewissas, it became the capital of Wessex. Its importance was increased by the introduction of Christianity, although it was not at first the seat of a bishop, because, according to the later Winchester Bishop, Cynegils wished to build a wealthy church in the city, and the Archbishop of Canterbury is said to have built the old minster. When the kings of Wessex became kings of all England, Winchester became, in a sense, the capital of England, though it always had a formidable rival in London, which was more central in position and possessed greater commercial advantages. The parallel position of the two cities in Anglo-Saxon times is illustrated by the law of Edgar, ordaining that the standard of weights and measures for the whole kingdom should be "such as is observed at London and at Winchester." Under Alfred it became a centre of learning and education, to which distinguished strangers, such as St. Grimbald and Asser the Welshman, resorted. It was the seat of Caunter’s government; many of the kings, including Egbert, Alfred, Edward the Elder and Canute, were buried there, and, in 1043, Edward the Confessor was crowned in the old minster. The city was sometimes granted as part of the dowry of a queen consort, and it was the home of Emma, the wife of Ethelred the Unready and of Canute, and later of Edith, the wife of the Confessor.

Winchester was very prosperous in the years succeeding the Conquest, and its eminence, together with London, from Domesday Book is probably an indication of its peculiar position and importance; its proximity to the New Forest commended it to the Norman kings, and Southampton, only 12 m. distant, was one of the chief ports for the continent. The Conqueror wore his crown in state at Winchester every Easter, as he wore it at Westminster at Whitsuntide and at Gloucester at Christmas. The royal treasure continued to be stored there as it had been in Anglo-Saxon times, and was there seized by William Rufus, who, after his father’s death, "rode to Winchester and opened the Treasure House." In the reign of Stephen and again in the reign of Henry II. the Court of Exchequer was held at Winchester, and the charter of John promises that the exchequer and the mint shall ever remain in the city; the mint was an important one, and when in 1125 all the coiners of England were tried for false coining those of Winchester alone were acquitted with honour.

Under the Norman kings Winchester was of great commercial importance; it was one of the earliest seats of the woolen trade, which in its different branches was the chief industry of the town, although the evidence furnished by the Liber Winton (temp. Henry I. and Stephen) indicates also a varied industrial life. As early as the reign of Henry I. the gild of weavers is mentioned, and the millers at the same date render their account to the exchequer.

The gild merchant of Winchester claims an Anglo-Saxon origin, but the first authentic reference to it is in one of the
WINCHESTER

charters granted to the city by Henry II. The Liber Vinson speaks of a "eniths' gild," which certainly existed in the time of the Confessor. The prosperity of Winchester was increased by the St. Giles's Fair, originally granted by Rufus to Bishop Walkelin. It was held on St. Giles's Hill up to the 19th century, and in the middle ages was one of the chief commercial events of the year. While it lasted St. Giles's Hill was covered by a busy town, and no trade was permitted to be done outside the fair within seven leagues, or at Southampton; the jurisdiction of the mayor and bailiffs of the city was in abeyance, that of the bishop's officials taking its place.

From the time of the Conqueror until their expulsion by Edward I., Winchester was the site of a large colony of Jews, whose quarter in the city is marked to the present day by Jewry Street; Winchester is called by Richard of Devizes "the Jerusalem of England" on account of its kind treatment of its Jews, and there alone no anti-Jewish riots broke out after the coronation of Richard I. The corporation of Winchester claims to be one of the oldest in England, but the earliest existing charters are two given by Henry II., one merely granting to "my citizens of Winchester, who are of the gild merchant with their goods, freedom from toll, passage and custom," the other conferring upon them all liberties and customs which they enjoyed in the time of Henry I.; further charters, amplifying and confirming, were issued by succeeding sovereigns, were granted by Richard I. and John. The governing charter till 1835 was that of 1587, incorporating the city under the title of the "Mayor, Bailiffs and Commonalty of the City of Winchester"; this is the first charter which mentions a mayor, but it says that such an officer had "existed out of mind," and as early as 807 the town was governed by a wicerga, by name Beornwull, whose death is recorded in the Anglo-Saxon Chronicle. There is a doubtful reference to a mayor in 1194, and the office certainly existed early in the 12th century; but until 1292 the liberty of the sole encircling the city on almost every side was outside the jurisdiction of the city magistrates, being under the seigniory of the bishop of Winchester.

Winchester seems to have reached its zenith of prosperity at the beginning of the 12th century; the first check was given during the civil wars of Stephen's reign, when the city was burned. However, the last entry concerning it in the Anglo-Saxon Chronicle says that Henry Plantagenet, after the treaty of Wallingford, was received with "great worship" in Winchester and London, and recognizing the equality of the two cities, but the latter was rising at Winchester's expense, and at the second coronation of Richard I. (1904) the citizens of Winchester had the significant mortification of seeing in their own city the citizens of London take their place as cupbearers to the king. The loss of Normandy further favoured the rise of London by depriving Winchester of the advantages it had enjoyed from its convenient position with regard to the continent. Moreover, it suffered severely at the hands of Simon de Montfort the Younger (1263), although it still continued to be an occasional royal residence, and the Statute of Winchester (1285) was passed in a council held there. Meanwhile the wool trade had drifted in great measure to the east of England; and an attempt made to revive the prosperity of Winchester in the 14th century by making it one of the staple towns proved unsuccessful. The wine trade, which had been considerable, was ruined by the sack of Southampton (1338); a few years later the city was devastated by the black death, and the charter of Elizabeth speaks of "our city of Winchester now fallen into great ruin, decay and poverty." During the Civil War the city suffered much from loyalty to Charles I., and lost its ancient castle founded by William I. After the Restoration a scheme was started to restore trade by making the Itchen navigable to Southampton, but neither then nor when revived in the 19th century was it successful. Charles II., intending to make Winchester again a royal residence, began a palace there, which by being unfinished at his death was used eventually as barracks. It was burnt down in 1804 and rebuilt in 1901. Northgate and Southgate were pulled down in 1781, Eastgate ten years later.

Westgate still stands at the top of the High Street. The guard-room was formerly used as a debtors' prison, now as a museum. The two weekly markets, still held in the Corn Exchange of Wednesday and Saturday, were confirmed by Elizabeth's charter; the latter dates from a grant of Henry VI. abolishing the Sunday market, which had existed from early times. The same grant established three fairs—one on October 13 (the day of the translation of St. Edward, king and confessor), one on the Monday and Tuesday of the first week in Lent, and another on St. Swithin's day; the former two are still held. Winchester sent two members to parliament from 1295 to 1885, when the representation was reduced to one.

Winchester, a town and the county-seat of Clark county, Kentucky, U.S.A., in the e. part of the Blue Grass region of the state, about 18 m. E. by S. of Lexington. Pop. (1890) 45105 (1900) 5064, including 3128 negroes; (1910) 7156. It is served by the Louisville & Nashville, the Chesapeake & Ohio and the Lexington & Eastern railways, the last being a short road (from Lexington to Jackson) extending into the mineral and timber region of Eastern Kentucky. The town is the seat of the Kentucky Wesleyan College (co-educational; Methodist Episcopal, South), opened in 1866, and of the Winchester Trades and Industrial School (1900). Winchester is in an agricultural, tobacco-growing, sleeping-town and resort region, and has various manufactures. It was first incorporated in 1792.

Winchester, a township of Middlesex county, Massachusetts, U.S.A., about 8 m. W. of Boston at the head of Mystic Pond, one of the sources of the Mystic river. Pop. (1900) 7248, of whom 1906 were foreign-born and 140 were negroes; (1910) 9350. Area, 6 sq. m. Winchester is served by the southern division of the Boston & Maine railway, and is connected with Boston, Arlington, Medford, Stoneham and Woburn by electric lines. It is chiefly a residential suburb of Boston. During the period of the substitution of freight for passenger traffic, which emptied into Mystic Pond, in Winchester township, both favourite resorts for canoeing, &c. Wedge Pond and Winter Pond, in the centre of the township, are clear and beautiful sheets of water. The streets of Winchester are heavily shaded, the view as presented from the neighbouring hills being that of a continuous forest stretching from the beautiful Mystic Valley parkway (of the Metropolitan park system), of which more than one-half (50-2 acres) is in the southern part of the township, to the Middlesex Fells Reservation (another Metropolitan park), of which 261.9 acres are in the eastern part; and there are a large number of centres of recreation, of which the Hain Pond Mountain and Indian Hill are about 320 ft. above sea-level. One of the pleasantest residential districts is Rangeley, a restricted private park. The town-hall and library building is a fine structure; the library contains about 20,000 volumes, and the museum and collections of the Winchester Historical and Genealogical Society. The principal manufactures are leather and felt goods. Winchester was originally within the limits of Charlestown.

In 1638 allotments of land between the Mystic Pond and the present Woburn were made to various Charlestown settlers, including John Harvard and Increase Nowell (1590-1653), secretary of the Massachusetts Bay Colony in 1644-1649, and the new settlement was called Waterfield. Most of this territory in 1642 was incorporated in Woburn and was called South Woburn. In 1830 Winchester was separately incorporated, parts of Arlington (then West Cambridge) and Medford going to make it up its area, and was named in honour of Colonel W. P. Winchester of Watertown, who left to the township a legacy for municipal works.

Winchester, an independent city and the county-seat of Frederick county, Virginia, U.S.A., 87 m. by rail. W.N.W. of Washington. Pop. (1890) 5165; (1900) 5161, including 1105 negroes; (1910) 5864. Winchester is served by the Baltimore & Ohio and the Cumberland Valley railways. It is pleasantly situated in the fertile Shenandoah Valley about 720 ft. above sea-level. Fort Loudoun Seminary for girls occupies the site of old Fort Loudoun, and in the city is the Shenandoah Valley Academy, a military school for boys. The Handley library
(1910), a memorial to John Handley, a part of whose estate was bequeathed to establish industrial schools for the poor of Winchester, and an auditorium are owned by the municipality. The United States National Military Cemetery at Winchester contains the graves of 4,480 Union soldiers, 2,382 of them unknown, and adjoining it is the Confederate Stonewall Cemetery, with about 8,000 graves. The manufacture of gloves is the leading industry; among the other manufactures are woollen and knit goods, flour, leather, lumber, paper and bricks. Electricity, generated at the Shenandoah river, is used for power in many of the factories.

A settlement was established in this vicinity as early as 1732. In 1752 the present name was adopted and the town was established by act of the colonial legislature. In 1756, during the Seven Years' War, George Washington, in command of the provincial troops of Virginia, established his headquarters here and built Fort Loudoun. The town was incorporated in 1779. The Virginia Gazette and Winchester Advertiser, the first newspaper published in the Shenandoah Valley, was established here in 1787. In the Civil War, Winchester, because of its position in the lower Shenandoah Valley, played a great part, and was several times the scene of engagements between the Union and Confederate forces—in 1862, Jackson's actions of Kernstown, and in 1863, when General Sigel captured the position of a Union garrison by Ewell (14-15 June 1863); and in Sheridan's campaign of 1864 the battle of Winchester or Opequon (Sept. 19, 1864), for all of which see SHENANDOAH VALLEY CAMPAIGNS. Winchester was chartered as a city in 1852 and in 1906 the corporate limits were enlarged.

See J. E. Norris (ed.), History of the Lower Shenandoah Valley (Chicago, 1890), and T. K. Cartmell, Shenandoah Valley Pioneers (Winchester, 1909).

WINCKELMANN, JOHANN JOACHIM (1717-1768), German archaeologist, was born at Stendal in Brandenburg on the 9th of December 1717, the son of a poor shoemaker. He attended a gymnasium at Berlin and the school at Salzwedel, and in 1738 was induced to go as a student of theology to Halle. But he was no theologian, and he soon devoted himself with enthusiasm to Greek art and literature. With the intention of becoming a physician he attended medical classes at Jena; but means were insufficient and he was obliged to accept a tutorship near Magdeburg. From 1743 to 1748 he was associate-rector of a school at Seethausen in the Altmark. He then went to Nöthnitz near Dresden, to Cardinal Antoneto, the Bishop of Meissen, and while in the study of the Holy Roman empire he collected materials. The treasures in the Dresden gallery awakened an intense interest in art, which was deepened by association with various artists, and especially with A. F. Oester, who afterwards exercised so powerful an influence over Goethe. Winckelmann's study of ancient literature had inspired him with a desire to visit Rome, and he became librarian to Cardinal Passieno in 1754. This compelled him reluctantly to join the Roman Catholic Church.

In 1755, before leaving for Rome, Winckelmann published his Gedanken über die Nachahmung der griechischen Werke in Malerei und Bildhauerkunst ("Thoughts on the Imitation of Greek Works in Painting and Sculpture"), followed by a pretended attack on the work, and a defence of its principles, nominally by an impartial critic. The Gedanken contains the first statement of the doctrines he afterwards developed, and was warmly admired not only for the ideas it contained but for its style. Augustus III., elector of Saxony and king of Poland, granted him a pension of 200 thalers, that he might prosecute his studies in Rome. He arrived in Rome in November 1755, became a member of Cardinal Albani's household, and received much kindness from Cardinal Passieno. After their death in 1761 he was received as librarian and as a friend into the house of Cardinal Albani, who was forming his magnificent collection at Porta Salara. In 1763, while retaining this position, Winckelmann was made prefect of antiquities.

He devoted himself earnestly, at first with the aid of his friend A. R. Mengs, to the study of Roman antiquities, and gradually acquired an unrivalled knowledge of ancient art. In 1760 appeared his Description des pierres gravées du feu Baron de Stossich; in 1762 his Anmerkungen über die Baukunst der Allen ("Observations on the Architecture of the Ancients"), including an account of the temples at Paestum. In 1758 and 1762 he visited Naples, and from his Schilderungen der herculanischen Entdeckungen (1762) and his Nachricht von den neuesten herculanischen Entdeckungen (1764) scholars obtained their first real information about the treasures excavated at Pompeii and Herculanum. Winckelmann again visited Naples in 1765 and 1767, and wrote for the use of the electoral prince and princess of Saxony his Briefe an Bianconi, which were published, eleven years after his death, in the Anistologia romana. His masterpiece is the Geschichte der Alten Künstler ("History of Ancient Art"), issued in 1764, which, without recognizing the importance of a permanent contribution to European literature. In this work Winckelmann sets forth both the history of Greek art and the principles on which it seemed to him to be based. He also presents a glowing picture of the conditions, political, social and intellectual, which tended to foster creative activity in ancient Greece. The fundamental idea of his theory is that the end of art is beauty, and that this end can be attained only when individual and characteristic features are strictly subordinated to the general end of art. The true artist, selecting from nature the phenomena fitted for his purpose, and combining them through the imagination, creates an ideal type marked in action by "noble simplicity and calm greatness"—an ideal type in which normal proportions are maintained, particular parts, such as muscles and veins, not being permitted to break the harmony of the general outlines. In the historical portion he used not only the works of art he himself had studied but the scattered notices on the subject to be found in ancient writers; and his wide knowledge and active imagination enabled him to give fruitful suggestions as to periods about which he had little direct information. Many of his conclusions were based on the inadequate evidence of Roman copies have been modified or reversed by subsequent research, but the fine enthusiasm of the work, its strong and yet graceful style, and its vivid descriptions of works of art give it enduring value and interest. It marked an epoch by indicating the spirit in which the study of Greek art should be approached, and the methods by which investigators might hope to attain to solid results. To Winckelmann's contemporaries it came as a revelation, and exercised a profound influence on the best minds of the age. It was read widely by Goethe, and Winckelmann is known as the earliest of Winckelmann's works the starting-point for his later works.

Winckelmann contributed various admirable essays to the Bibliothek der schönen Wissenschaften; and in 1766 he published his Versuch einer Allegorie, which, although containing the results of much thought and reading, is not conceived in a thoroughly critical spirit. Of far greater importance was the splendid work entitled Monumenti antichi inediti (1767-1768), prefaced by a Trattato preliminare, presenting a general sketch of the history of art. The plates in this work are representations of objects which had either been falsely explained or not explained at all. Winckelmann's explanations were of the highest service to archaeology, by showing that in the case of many works of art supposed to be connected with Roman history the ultimate sources of inspiration were to be found in Homer.

In 1768 Winckelmann went to Vienna, where he was received with honour by Maria Theresa. At Trieste on his way back he was murdered in an hotel by a man named Arcangelli to whom he had shown some coins presented by Maria Theresa (June 8th. 1768). He was buried in the churchyard of the cathedral of St Giusto at Trieste.

An edition of his works was begun by Fernow in 1808 and completed by Meyer and Schulze (1868-1820). There are admirable studies of his character and work in Goethe's Winckelmann und sein Jahrhundert (1805), to which contributions were made by Meyer and Wolf, and in Walter Pater's Renaissance (1902). The best biography of Winckelmann is by Just, Winckelmann und seine Zeitgenossen (2nd ed., 3 vols., Leipzig, 1898). A collection of letters, Briefe an seine Züricher Freunde, was published by Blümner (Freiburg, 1882). (J. St.; J. M. M.)
WIND—WINDHAM

WIND (a common Teut. word, cognate with Skt. vasus, Lat. ventus, cf. “weather,” to be of course distinguished from to “wind,” to coil or twist, O.Eng. winidan, cf. “wander,” “wend,” &c.), a natural motion of the air, a current of air coming from any particular direction or with any degree of velocity. For the general account of winds, their causes, &c., see METEOROLOGY. Winds may be classified according to the strength or velocity with which they blow, varying from a calm, a breeze to a gale, storm or hurricane; for the varying scale of velocity per hour of these see BEAUFORT SCALE, and for the measurement ANEMOMETER.

Another classification divides them into “regular” or “constant” winds, such as the “trade winds” (q.v.) and “periodic” winds, such as the “monsoon” (q.v.). There are many special winds, such as the “Föhn,” “chinook,” “mistral,” “harmattan,” “sirocco,” which are treated under their individual names. For the group of musical instruments known by the generic name of WIND INSTRUMENTS see that heading.

WINDAU (Russian Windara, Lettish Wendelis), a seaport and sea-bathing resort of western Russia, in the government of Courland, at the mouth of the Windau, on the Baltic Sea, 114 mi. N.E. of Riga. Pop. (1907), 7432. It was first built in 1290. The harbour, 24 and 25 ft. deep, is free from ice all the year round. Timber, grain and other commodities are exported to the annual value of two to three millions sterling; the imports range between three-quarters and one million sterling.

WIND BRACES, in architecture, diagonal braces to tie the rafters of a roof together and prevent “racking.” In the better sort of medieval roofs they are arched, and run from the principal rafters to catch the purline.

WINDBANK, SIR FRANCIS (1563-1646), English secretary of state, was the only son of Sir Thomas Windbank of Hougham, Lincs., who owed his advancement to the Cecil family. Francis entered St John’s College, Oxford, in 1589, coming there under the influence of Laud. After a few years’ continental travel (1605-1608), he was employed for many years in minor public offices, and became clerk of the council. In June 1632 he was appointed by Charles I. secretary of state in succession to Lord Dorchester, his senior colleague being Sir John Coke, and he was knighted. His appointment was mainly due to his Spanish and Roman Catholic sympathies. The first earl of Portland, Francis de Grey, Lord Woresingham, and Windbank formed an inner group in the council, and with their aid the king carried on various secret negotiations, especially with Spain. In December 1634 Windbank was appointed to discuss with the papal agent Gregorio Panzani the possibility of a union between the Anglican and Roman Catholic Churches, and expressed the opinion that the Puritan and Roman Churches might be crippled by sending their leaders to the war in the Netherlands. Windbank’s efforts as treasury commissioner in 1633 to shield some of those guilty of corruption led to a breach with Archbishop Laud, and the next year he was for a time disgraced for issuing an order for the conveyance of Spanish money to pay the Spanish troops in the Netherlands. In July 1638 he urged upon the king instant war with the Scots, and in 1640, when tumults were breaking out in England, he sent an appeal from the queen to the pope for money and men. He was elected in March 1640 member of the Short Parliament for Oxford University, and he entered the Long Parliament in October as member for Corfe. In December the House learnt that he had signed letters of grace to recusant priests and Jesuits, and summoned him to answer the charge, but with the king’s consent he fled to France. From Calais he wrote to the first Lord Hatton, defending his integrity, and affirming his belief that the church of England was the purest and nearest the primitive Church. He remained in Paris until his death on the 1st of September 1646, shortly after he had been received into the Roman communion.

WINDERMERE, the largest lake in England, in the south-eastern part of the Lake District (q.v.). It is in the county of Westmorland, the boundary with Lancashire running from the head southwards along the western shore, round the foot and northward along about one-third of the eastern shore. It forms a narrow trough with a slightly curved axis of 103 m. The width at right angles to the axis never reaches 1 m. The area is 5.69 sq. m. The shores are generally steep, beautifully wooded and fretted with numerous little sheltered bays. The hills immediately surrounding the lake rarely reach 1000 ft., but the distant views of the mountains to the north and west contrast finely with the sylvan beauty of the lake itself. The middle of the lake, immediately opposite Bowness, is especially beautiful, for here a group of islands (Belle Isle, Thompson’s Holme, the Lilies and others) divide the lake into two bays, each with a width of about 1000 ft. The lake is about 300 ft. in depth. On the other hand, the greatest depth south of Bowness is 219 ft., and in the southern 134. The lake receives the Rothay and Brathay streams at the head; Trout Beck also flows into the north basin, and Conusy Beck from Esthwaite into the south. The lake is drained by the Leven. Steamers belonging to the Furness Railway Company ply regularly on Windermere, the chief stations being Lakeside, the terminus of a branch railway, beautifully situated at the foot, Ferry on the west shore below the islands, Bowness on the east and Waterhead, at the head, on Conusy Beck. The lake contains perch, pike, trout and char; there are several large hotels at Bowness and elsewhere on its shores.

The town of Windermere, above the eastern shore adjacent to Bowness (q.v.), is in the Appleby parliamentary division of Westmorland, and is the terminus of a branch line railway, beautifully situated at the foot, Ferry on the west shore below the islands, Bowness on the east and Waterhead, at the head, on Conusy Beck. The lake contains perch, pike, trout and char; there are several large hotels at Bowness and elsewhere on its shores.

WINDHAM, WILLIAM (1750-1816), English politician, came from an ancient family long resident at Felbrigg, near Cromer in Norfolk. His father, Colonel William Windham (1717-1761), was an adventurous soldier with a taste for languages, both ancient and modern; his son was born in Golden Square, London, on the 3rd of May 1750. He went to Eton, which he quitted in 1766 for the university of Glasgow, where he acquired the taste for mathematics which always distinguished him. In 1767 he matriculated as gentleman commoner at University College, Oxford, and Windham here remained until 1771. He never took the degree of B.A., but qualified as M.A. on the 7th of October 1782, and received the degree of D.C.L. on the 3rd of July 1793. He made a tour in Norway in 1773 and visited Switzerland and Italy between 1778 and 1780. His maiden speech on the political platform was delivered at Norwich on the 28th of January 1778, when he vehemently opposed the prosecution of the American war. His entrance into public life took place in April 1783, when he went to Ireland as chief secretary to Lord Northington, the lord-lieutenant in the coalition ministry of Fox and Lord North. Windham was his own keenest critic, his distrust in his own powers and his disappointment at his own achievements being conspicuous on every page of his Diary. Sickness compelled his return to England early in July 1783, and he resigned his position in August; but change of scene and constant exercise restored him to health before the end of that year. In April 1784 he was returned to parliament as member for Norwich by a majority of 64 votes, thus scoring one of the few triumphs attained by the adherents of the coalition cabinet. This seat he retained until 1827, when he was beaten on account of his hostility to the peace of that year.

Though he strenuously opposed all proposals for parliamentary reform, to which most of the Whigs were deeply committed, Windham remained in alliance with that party until after the outbreak of the French Revolution, when he and several of his chief allies joined Pitt. The place of secretary-at-war was conferred upon him in July 1794, and he was at the same time created a privy councillor and admitted to a seat in the cabinet. Windham discharged the duties of his office with unfagging zeal, his efforts being particularly directed towards ameliorating the condition of the inferior grades of the army. In the autumn of
1794 he was despatched to the duke of York's camp in Flanders with the views of his ministerial colleagues, but their advice could not counteract the military incapacity of the royal duke. When Pitt was frustrated in his intention for forcing the Roman Catholics from their political disabilities, Windham, who in religious matters always inclined to liberal opinions, was one of the ministers who retired from office in February 1801. He was a constant opponent of all negotiations for peace with France, preferring to prosecute the campaign at whatever cost until some decisive victory had been gained, and the temporary peace of Amiens, which was carried through under Addington's administration, did not meet with his approval. When he was ousted from the representation of Norwich in June 1802, a seat for the county of Norfolk was granted to him. He declined a place in Pitt's new cabinet (May 1804) on the ground that the exclusion of Fox prevented the formation of an administration sufficiently strong in parliament and the country to cope with the dangers which threatened the safety of the nation, and he offered a general opposition to the measures which the prime minister proposed. On Pitt's death in January 1806 the ministry of "All the Talents" was formed under the leadership of Lord Grenville, and Windham accepted the seals as secretary of state for war and the colonies. Fox's death negered the quality of a new sentence was proposed for Windham, but he declined the proffered honour and remained in office as long as the ministry existed. A general election took place in November 1806 and Windham was elected for the county of Norfolk; but the election was declared void on petition, and he was compelled to sit for the borough of New Romney, for which he had also been elected. In 1807, when parliament was dissolved under the influence of the "No Popery" cry of Spencer Perceval, a seat was found for Windham at Higham Ferrers. Liberty of religious opinion he uniformly supported at all periods of his life, and with equal consistency he opposed all outbreaks of religious fanaticism; hence with these convictions in his mind few of the domestic measures of the new ministers met with his approbation. Moreover, he disapproved of the expedition to the Scheldt, and thought the charges brought against the Duke of York, as commander-in-chief, required his retirement from office. At the same time he actively opposed the bill of Sir Samuel Romilly, his colleague on most political questions, for reducing the number of offences visited with the punishment of death. In July 1808 he received a blow on the hip whilst rendering assistance at a fire, which he thought little of; but it stopped him for a period, and a surgeon's opinion was taken on the point and an operation became necessary. This brought on a fever, and Windham rapidly sank. He died on the 4th of June 1810, and was buried in the family vault at Felbrig.

His speeches were published in three volumes in 1806, with a memoir by Thomas Amyot, his private secretary while he was in office in 1806, and his Diary was edited by Mrs Henry Baring in 1866. The passages in the latter work relative to Dr Johnson's declining days have been of considerable use to the later editors of Boswell.

**WIND INSTRUMENTS** (Fr. instruments à vent, Ger. Blasinstrummtc, Ital. strumenti di fusto), a numerous and powerful section of the orchestra classified according to the acoustic properties of the instruments and to certain intrinsic structural features. The first great natural subdivision is that of (A) mouth blown, and (B) mechanically blown, instruments. **Section A** falls into the classes of (1) wood wind, (2) brass wind, with their numerous subdivisions.

1. (a) Wood Wind.—Pipes without embouchure or mouthpiece, such as the ancient Egyptian one, a long flute with narrow bore and obliquely, and the syrinx or pan-pipes, both of which are blown by direct pressure on the lips. The oboe is a pipe added endwise, which it impinges against the sharp edge of the rim. (b) Pipes with embouchure but no mouthpiece, such as the transverse flute, piccolo and serpent, the latter a pipe with an embouchure and a circular bore, but no mouthpiece.

2. The Brass Wind consists of the following classes: (a) Tubes of fixed length, such as the natural trumpet and French horn, all medieval horns and trumpets, including the busine, the tuba, the oboe, the hunting horn and the bugle, music pipes, cornets, cornets, lictus and tuba. The compass of all these was restricted to the few notes of the harmonic series obtained by overblowing. (b) Tubes of which the length is varied by a slide, such as the sackbut family, the slide trombone and slide trumpet. When the slide is drawn out the column of air is lengthened and the pitch proportionally lowered. Each position or shift of the slide enables the performer to obtain the next lower harmonic of which the length is varied by lateral holes and keys. To this class belong the keyed bugle and its bass the ophicleide, the oboe and the clarinet (Bassoons) and all brass and Russian bassoon, which immediately preceded the cornets. The cornets and sarrusophones might also be classed with these (see above, 1d).

(c) Tubes of which the length is varied by valves or pistons. This class includes most modern instruments. The valve was invented in 1815, which revolutionized the technique and scoring for brass instruments. A rational subdivision of valve instruments is made in Germany into whole and half instruments (see BOMBARDE and VALVES), according to whether the whole length of tubing comes into practical use or only half, or from the performer's point of view whether the fundamental note of the harmonic series can be produced, or whether the series begins with the second, member, an occurrence which is not infrequent in the first, in which case the end is obviously that half the tubing has no practical value. The principal piston instruments are: the whole instruments—contrabass and bass tubas, bombardons or tuba, euphonium, and such乐器 as the cornets, tenors, basset horns, Flügelhorns, tenor horns, cornets, the valve trombone, valve trumpet and valve horn (French horn), and the Wagner tubas, which are really the basses of the French horn and are played with four more valves. The mouthpieces and pipes are constructed according to the shape of the mouthpiece used. (a) With funnel-shaped mouthpiece, such as the French horn, tenor horn and Wagner tubas: (b) with bell-mouthpiece, and some of the other brass wind instruments except the bugle, of which the mouthpiece is a hybrid, neither true funnel nor true cup.

**Section B:** Mechanically Blown Instruments.—This section consists mainly of instruments having the air supply fed by means of bellows; it comprises the two classes: (1) with keyboard, (2) without keyboard.

1. This includes all kinds of organs: the ancient hydraulic organ or hydraulis, differing from the pneumatic only in that water pressure was used to compress the air supply instead of the bellows
being weighted by means of the foot and body of the performer at first and later by means of weights; the reed organ, consisting of pipes furnished with beating reeds, known also as the reed work when incorporated with the large church organ; the harmonium, upon them the power of dynamic expression denied to all organs fitted with flue pipes or pipes having beating reeds. The complex instruments known as organ pipes also come within this category.

2. This comprises the bagpipes known as musette, and the Union or Irish and the Border bagpipes having a wind supply fed by bellows instead of by the insufflation pipe proper to the bagpipes. Upon the barrel organ having instead of a keyboard a barrel studded with nails, which lift the valves admitting air to the flue pipes generally hidden within the case.

WINDISCHGRATZ, PRINCE ALFRED (1787-1862), Austrian field-marshall, entered the Austrian army in 1804, participated in all the wars against Napoleon and fought with distinction at Leipzig and in the campaign of 1814. In the following years of peace he held successive commands in Prague, being appointed head of the army in Bohemia in 1840. Having gained a reputation as a champion of energetic measures against revolution he was called upon to suppress the insurrection of March 1848 in Vienna, but finding himself ill-supported by the ministers he speedily threw up his post. Having returned to Prague he there showed firmness in quelling an armed outbreak of the Czech separatists (June 1848). Upon the recrudescence of revolt in Vienna he was summoned at the head of a large army and reduced the city by a formal siege (Oct. 20-29). Appointed to the chief command against the Hungarians he gained some early successes and reoccupied Budapest (Jan. 1849), but by his slowness in pursuit he allowed the enemy to rally in superior numbers and to prevent an effective concentration of the Austrian forces. In April 1849 he was relieved of his command and henceforth rarely appeared again in public life.

WINDMILL, a term used, in the widest sense, for a machine by which the energy of the wind is applied to useful purposes.

Windmills were certainly used as early as the 12th century and are still largely employed in Holland in draining the polders and grinding trass. They are somewhat extensively used in America for pumping and driving agricultural machinery. In spite of the competition of more powerful and tractable motors, they are serviceable, especially in new countries, where fuel is scarce and where work can be done intermittently. An inquiry was made in India in 1870 as to the possibility of using windmills for irrigation (Professional Papers on Irrigation Engineering, July 1879) with the result that it was concluded their usefulness would be very limited.

A windmill is not in any case a very powerful or efficient motor, and its work is variable and intermittent. In favourable positions, it will run on an average for eight hours out of the twenty-four. For pumping on a small scale, the intermittent action is least an objection, because there is generally a tank or storage reservoir regulating the delivery of the water. For driving dynamos windmills are least suitable, on account of the variation of speed, though some attempts to generate electricity by wind power have been made, special arrangements being adopted for automatically regulating the speed or power.

European Windmills.—In all the older windmills a shaft, called the wind shaft, carried four to six arms or whips on which long rectangular narrow sails were spread. The wind shaft was placed at an inclination of 10° or 15° with the horizontal, to enable the sails to clear the lower part of the mill. The whip carrying the sail was often 30 to 40 ft. in length, so that the tips of the sails described a circle 60 to 80 ft. in diameter. The sails were rectangular, 5 to 6 ft. wide, and occupying five-sixths of the length of the whip. A triangular leading sail was sometimes added, the tip of which was sometimes made of a sail-cloth spread on a framework; at other times narrow boards were used. The oldest mill was no doubt the post mill, the whole structure being carried on a post; to bring the sails to face the wind, the structure was turned round by a long lever. The post mill was succeeded by the tower, smock or frock mill, in which the mill itself consisted of a stationary tower, and the wind shaft and sails were carried in a revolving cap rotating on the top of the tower. Andrew Meikle introduced in 1730 an auxiliary rotating fan at right angles to the principal sails, which came into wind whenever the wind was against the sails, and automatically veering the sails or placing them normal to the wind. For safety, the sails must be reeded in high winds. In 1807, Sir W. Cubitt introduced automatic reeding arrangements. The sails were made of thin boards held up to the wind by weights. If the force of the wind exceeded a certain value the boards were pressed back and exposed little surface.

American Windmills.—These generally have the sails, 18 or more in number, arranged in an annulus or disk. The sails consist of narrow boards or slats arranged radially, each board having a constant or variable inclination to the wind's direction. An American mill presents a larger surface for a given length of sail than the older type, and consequently the construction is lighter. To turn the mill face to the wind a rudder is sometimes used projecting backward in a plane at right angles to the plane of rotation of the sails. Various arrangements are adopted for reeding the sails automatically. (a) In some an action equivalent to reeding is obtained by turning the sail disk oblique to the wind. The pressure on a side vane in the plane of rotation, controlled by a weight, turns the sail disk edgeways to the wind if the pressure exceeds a safe amount. (b) In centrifugal governor mills the slats forming the sails are connected in sets of six or eight, each set being fixed to a bar at the middle of its length. By rotating this bar the slats are brought end on to the wind, the action being analogous to shutting an umbrella. The slats are held up to the wind by a weight. A centrifugal governor lifts the weight if the speed becomes excessive and the sails are partially or completely furled. Many of the veering and reeding arrangements are very ingenious and too complicated to be described without detailed drawings. A description of some of these arrangements will be found in a paper by J. A. Griffiths (Proc. Inst. C. Eng., 110, p. 321) and a "Report on Trials of Wind Pumping Engines at Park Royal in 1903" (Journ. Roy. Agric. Soc., 64, p. 174).

Warner's Annular Sails Windmills.—Messrs Warner of London make a windmill somewhat similar to American mills. The vanes consist of a frame covered with canvas, and these are pivoted between two angle-iron rings so as to form an annular sail. The vanes are connected with spiral springs, which keep them up to the best at the height of weather for light to strong winds. As the wind increases, the vanes give to the wind, forcing back the springs, and thus the area on which the wind acts diminishes. In addition, there is a striking lever and toggle for setting the vanes edgeways to the wind when the mill is stopped or a storm is expected. The
wheel is kept face to the wind by a rudder in small mills; in large mills a subsidiary fan and gear are used. Fig. 2 shows a large mill of this kind, erected in a similar manner to a tower mill. The tower is a framework of iron, and carries a revolving cap, on which the wind shaft is fixed. Behind is the subsidiary fan with its gearing acting on a toothed wheel fixed to the cap.

It is important that a wind-mill should control itself so that it works efficiently in moderately strong winds and at the same time runs in very light winds, which are much more prevalent. It should also, by reeling or otherwise, secure safety in storms.

Table I gives the mean velocity of the wind in miles per hour for an inland station, Kew, and a very exposed station, Scilly, for each month during the period 1890-1899. The pressure of the wind on a plane normal to its direction, composed partly of an excess front pressure and negative back pressure, is given by the relation

\[ p = 0.003 \nu^2 \]

where \( p \) is in pounds per square foot and \( \nu \) the velocity of the wind in miles per hour.

When the sail is rotating in a plane at right angles to the wind direction the conditions are more complicated. In Fig. 4 let XX be the plane of rotation of the vane and YY the direction of the wind. Let \( \theta \) be the angle between the normal to the vane, \( \theta \) being the weather of the vane. Let \( \Omega = \nu \) be the velocity of the wind, \( \Omega = \nu \) the velocity of the vane. Completing the parallelogram, \( \Omega = \nu \), is the velocity and direction of the wind relative to the vane.

\[ v = \sqrt{\nu^2 + \Omega^2} \]

and the angle between the relative direction of wind and normal to the vane is \( \theta + \phi \). It is clear that \( \theta + \phi \) cannot be greater than \( 90^\circ \), or the vane would press on the wind instead of the wind on the vane. Substituting these values in the equations already given, the normal pressure on the oblique moving vane is

\[ n = 0.003 \nu^2 \sin (\theta + \phi) \frac{2 \sin (\theta + \phi)}{1 + \cos (\theta + \phi)} \]

The component of this pressure in the direction of motion of the vane is

\[ t = 0.003 \nu^2 \sin (\theta + \phi) \frac{2 \sin (\theta + \phi) \cos (\theta + \phi)}{1 + \cos (\theta + \phi)} \]

and the work done in driving the vane is

\[ t \nu = \frac{2 \sin (\theta + \phi) \cos (\theta + \phi)}{1 + \cos (\theta + \phi)} \]

foot lb per sq. ft. of vane per sec., where \( \nu \) is taken in miles per hour. For such angles and velocities as are usual in windmills this would give for a square foot of vane, near the tip of a \( 0.003 \nu^2 \) ft. lb per sec. But parts of the vane or sail nearer the axis of rotation are less effective, and there are mechanical friction and other causes of inefficiency. An old rule based on experiments by Coulomb on mills of the European type gave the average effective work in foot lb per sec. per sq. ft. of sail

\[ W = 0.001 \nu^2 \]

Some data given by Wolff on mills of the American type gave for the same quantity

\[ W = 0.000455^2. \]

From some of the data of experiments by Griffiths on mills of the American type used in pumping, the effective work in pumping when the mill was working in the best conditions amounted to 0.0005 to 0.0008 ft. lb. per sec. per sq. ft.

In 1903 trials of wind-pumping engines were carried out at Park Royal by the Royal Agricultural Society (Journ. Roy. Agric. Soc. Ixiv. 174). The results on six of the best mills used are given in Table II.

A valuable paper by J. A. Griffiths (Proc. Inst. Civ. Eng. cxxix. 321) contains details of a number of windmills of American type used for pumping and the results of a series of trials. Table III contains an abstract of the results of his observations on six types of windmills used for pumping:

Although the employment of tracery continued long after the classic revival, the examples generally are poor in design, and even in their picturesque (as of the period of Henry II, in the church at Le Grand Andely, the incrustation of circular fanlights in the ordinary and rose windows was of too capricious a character to make them worthy of much attention. The early Renaissance architect Ercole Ravenshaw in the apse of St Pierre at Caen (1520), seemed to feel that the stained glass was too much cut up by the tracery and mullions, and omitted them altogether, trusting to the iron stanchions and cross-bars to carry the weight. The window in question was one of the semi-circular headed window of Roman times, retaining only the moulings of the flat Flamboyant period for the jambs and arch-moulds. Windows of the Flamboyant type, the chief ornament of place in domestic architecture, so that the mullion window was retained with two or three transoms, all moulded and with square heads; in the Tudor period cusping was introduced in the upper lights and occasionally in those below, and this custom lingered for a long time in the collegiate buildings of Oxford and Cambridge and in various houses throughout England. In France, square-headed windows were almost always employed, owing to the earlier introduction there of the Renaissance style, when the decoration of the murals, generally consisting of classic pilasters, required some kind of architrave, frieze and cornice, to render the order complete; eventually the mullion and transom disappeared, and in the earlier work of the Louvre the windows are simple rectangular openings, fitted with wooden framework, and, like those in Rome, Milan and Genoa, depend for their architectural effect on the moulded classic jambs, and the lintel, frieze and cornice, so that the whole effect was one of grace. In the windows of St Mark's in Venice, where a parclose was required, with small semicircular or pilasters carrying the usual entablature, with small pediments sometimes angular and sometimes semicircular, repeating in fact an ancient Roman design, of which almost nothing was retained in the blank retaining space of niches and niches which decorated some of the enclosure walls of the Roman thermae. In Florence and Siena the early windows of the Renaissance style are and are coupled together, there being two lights to the window divided by shafts, thus continuing the tradition of those of the earlier Tuscan palaces; the same tradition was followed in Venice, Verona and other towns in the northeast, where the Gothic influence of the Low Countries created a transition; thus the moulings of the windows of the Vendramini and Corner Spinelli palaces follow closely those of the Ducal. In other words, these are semicircular instead of being either pointed or ogee in form. Another type peculiar to Venice is a lofty window with semicircular head enclosed in a rectangular panel and crowned with a small entablature and pediment. The only new combination of the 16th century in Italy, which was largely adopted in England by Inigo Jones and his followers in the 17th and 18th centuries, is the so-called Venetian or Palladian window, the finest example of which is that found in the Sala della Signoria, the Senate Room of the Doge's palace, at Venice, it is true, but it was copied by Palladio to light an open gallery, but the composition was so generally approved that it led to its constant adoption for a window of greater or less importance. It is distinct from the ordinary simple rectangular form. It consists of a central light, either round or oval, or in an octagon, carried on an impost consisting of a small entablature, under which, and enclosing two other lights, one on each side, are pilasters. In the window which Inigo Jones installed in the Palladian window was introduced by Inigo Jones in the centre of the facade front at Wren, by Lord Burlington in the centres of the wings of the Royal Academy, and good examples exist in Holkham House, Norfolk, by Kent, and in Worcester College, Oxford. There do not seem to be any examples in either Germany, France or Spain. Circular and oval lights, lighting a mezzanine on the upper part of a hall, are found in Italy, France and England, and occasional rectangular windows when the main front is decorated with semidetached columns as at Hampton Court Palace.

R. P. S.

**WINDOW CORNICE**.—An ornamental framework of wood or composition to which window curtains are attached by rods with rings or hooks. Cornices are of various kinds of elaborate design, but they are less fashionable in the 20th century than before it was discovered that elaborate draperies harbour dust and microbes. Like other pieces of furniture, they have reflected taste as it passed, and many of the carefully constructed examples of the latter part of the 18th century are still in use in the rooms for which they were made. Chipperdale provided a famous series still in situ for the gallery at Harewood House, the valances of which are, like the cornices themselves, of carved and gilded wood. Cornices are fitted to outside windows, and are found in the windows of many houses, except in the Venetian heads of French work.

**WINDOW SEAT**.—A miniature sofa without a back, intended to fill the recess of a window. In the latter part of the 18th century, when tall narrow sash windows were almost universal, the window seat was in high favour, and was no doubt in keeping with the formalism of Georgian interiors. It differed much in decorative detail, but little in form. It stood as high from the floor as a chair; the two ends were identical, with a roll-over curve, more or less pronounced. The seats and ends were usually upholstered in rich fabrics which in many cases have remained intact. The legs followed the fashion in chairs and were square and tapered, or, somewhat later, round and reeded. Hepplewhite and the brothers Adam designed many graceful window seats, but they were produced by all the cabinet-makers of the period.

**WINDY TAC**.—A tax first levied in England in the year 1657 for the purpose of defraying the expenses and making up the deficiency arising from clipped and defaced coin in the reign of silver during the reign of William III. It was an assessed tax on the rental value of the house, levied according to the number of windows and openings on houses having more than six windows and worth more than £5 per annum. Owing to the method of assessment the tax fell with peculiar hardship on the middle classes, and to this day traces of the endeavour to lighten its burden may be seen in numerous bricked-up windows.

The revenue derived from the tax in the first year of its levy amounted to £1,200,000. The tax was increased no fewer than six times between 1747 and 1808, but was reduced in 1823. There was a strong agitation in favour of the abolition of the tax during the reign of George III (1760-1815), and it was accordingly repealed on the 24th of July 1815, and a tax on inhabited houses substituted. The tax contributed £1,856,000 to the imperial revenue the year before its abolition. There were in England in the year 1814 about 275,000 houses having fifty windows and upwards; about 275,000 houses having forty windows and upwards, and about 725,000 having seven windows or less.

In France there is still a tax on doors and windows, and this forms an appreciable amount of the revenue.

**WINDPIPE**.—The trachea. (Gr. tracheia, sc. apriymbia, literally, rough artery), the air tube which leads from the larynx to the bronchi and lungs (see **RESPIRATORY SYSTEM**).

**WINDSOR**, a city and port of entry of Essex county, Ontario, Canada, on the left bank of the Detroit River, opposite the city of Detroit, Pop. (1905) 12,155. It is on the Grand Trunk, Canadian Pacific, Pere Marquette and Michigan Central railways, which connect at this point with the railways of the United States by means of large and powerful car-ferries. It is the centre of an important agricultural and fruit-growing district, in which tobacco is also produced. Salt works, flour mills, canning factories, and the manufacture of type-setting machines are the principal industries. During the season of navigation it is the centre of a large coasting trade on the Great Lakes.

**WINDSOR**, a township of Hartford county, Connecticut, U.S.A., on the Connecticut and Farmington rivers, adjoining the City of Hartford (1859) 2954; (1900) 3514, 596 being foreign-born; (1910) 4178. Among the buildings served by the New York, New Haven & Hartford railroad and by electric lines to Hartford and to Springfield, Massachusetts. Among the buildings are the Congregational Church, built in 1704 (the church itself was organized in 1630 in England), the Protestant Episcopal Church (1864) and the Roger Ludlow School. In Windsor are the Campbell School (for girls) and a public library (1888). The Loomis Institute (incorporated 1874 and 1905) for the gratuitous education of persons between 12 and 17 years of age has about 600 pupils, and the gifts of the Loomis family. Tobacco and market vegetables are raised in Windsor, and among its manufactures are paper, canned goods, knit and woollen goods, cigars and electrical supplies.

In 1635 Captain William Holmes, of the Plymouth Colony, established near the mouth of the Farmington river a trading post, the first settlement by Englishmen in Connecticut; a more important and a permanent settlement (until 1637 called New Dorchester) was made in 1635 by immigrants from Dorchester, Massachusetts, led by the Rev. John Warehouse, Roger Ludlow and others in England by the tract of ten-necticut Colony. Among the original land-holders were Matthew Grant and Thomas Dewey, ancestors respectively of General

1 In the township of Windsor Locks (pop. 1910, 3715), immediately north, cotton yarn and thread, silk, paper, steel and machinery are manufactured.
WINDSOR

U. S. Grant and Admiral George Dewey; and Captain John Mason (1600-1672), the friend of Miles Standysh, was one of its early citizens. It was the birthplace of Roger Wolcott, of the older Oliver Wolcott (1726-1707), of Oliver Ellsworth (whose home is now a historical museum), and of Edward Rowland Hill. Windsor has been called "The Mother of Towns"; it originally included the territory now constituting the present township, and the townships of East Windsor (1768), Ellington (1756), South Windsor (1843), Simsbury (1760), Granby (1760), East Granby (1858), Bloomfield (1853) and Windsor Locks (1854).

WINDSOR (properly NEW WINDSOR), a municipal borough of Berkshire, England, and a parliamentary borough extending into Buckinghamshire. Pop. (1901) 14,130. The town, which is famous for its royal castle, lies on the west (right) bank of the Thames, 214 m. W. of London by the Great Western railway, which serves it with a branch line from Slough. It is also the terminus of a branch of the London & South-Western railway. Here the Thames, from an easterly course, sweeps first nearly northward and then south-eastward.

The castle lies at the north-eastern edge of the town, on a slight but commanding eminence, while the massive round tower in the centre, on its artificial mound, is conspicuous from far over the flat land to the east, north and west. The site of the castle is an irregular parallelogram measuring about 650 yds. by 185 yds. On the west the walls enclosing the "tower ward," with the Chapel, Garter, St. George's, and Henry III. towers, overlook Thames Street and High Street, from which the "hundred steps" give access to the ward on the north, and the Henry VIII. gateway, opening from Castle Hill, on the south. This ward contains St George's Chapel in the centre, with the Albert Memorial Chapel on the east and the Shoeshoes Cloisters on the west. To the north are the deanery and the canons' residences, for the foundation attached to the royal chapel has the privileges of a "royal peculiar," the dean being exempt from episcopal jurisdiction. To the south are the guard-room and the houses of the military knights, or pensioners.

The round tower occupies the "middle ward"; on its flag-turret the Union Jack or the Royal Standard is hoisted according as the sovereign is absent or present. The buildings in the "upper ward," cast of this, form three sides of a square; the state apartments on the north, the private apartments on the east and the visitors' apartments on the south. Along the north side of the castle extends the north terrace, commanding, from its position above a steep slope, splendid views across the river to Eton on the Buckinghamshire side, and far over the valley of the Thames, which here is deeply incised in the chalk. Under the parapet of the castle are theRoyal Gardens, containing in front of the private apartments, and the south terrace continues farther, as far as the George IV. gateway. The Home Park lies adjacent to the castle on the south, east and north. The Great Park extends south of Windsor, where the land, rising gently, is magnificently timbered with the remnants of the old royal forest. The village of Old Windsor (in distinction from which the name of New Windsor is given to the borough) lies by the river, south of the Home Park. To the west of Windsor itself the village of Clewer has become a suburb of the town.

As early as the time of the Heptarchy a stronghold of some importance existed at Windsor, the great mound, which is moated, circular and about 125 ft. in diameter, being a remnant of this period. William the Conqueror was attracted by the forest as a hunting preserve, and obtained the land by exchange from Westminster Abbey, to which Edward the Confessor had given it. Thereafter the castle became what it remains, the chief residence of the English sovereigns. The Conqueror replaced the primitive wooden enclosure by a stone circuit-wall, and the first complete round tower was built by Henry III. about 1272, but Edward III. wholly reconstructed it on a more massive scale, about 1344, to form a meeting-place for his newly established order of Knights of the Garter. He selected this spot because, according to a legend quoted by the chronicler Froissart, it was on the summit of the mound that King Arthur used to sit surrounded by his Knights of the Round Table. The bulk of the existing round tower is of Edward's time, but its walls were heightened and the tall flag-turret added by the court architect, Sir Jeffrey Wyatville, in the reign of George IV. In addition to the Round Tower, Henry III. had constructed long lines of circuit-walls, crowned at intervals with smaller towers. He also built a great hall (the present chapter library) and other apartments, together with his chapel, whose spires afterwards yielded down to make room for the chapel of St George. The beautiful little dean's cloister preserves a portion of Henry's work in the south wall, a contemporary portrait of the king appearing in dis-temper on one of the arches. Another chapel was built by him and dedicated to his favourite saint, Edward the Confessor. This graceful building, with an eastern apse, is now called the Albert Memorial Chapel; some of Henry III.'s work still exists in the lower part of its walls, but the upper part was rebuilt 1460-1503 by Henry VII., who intended it as a burial-place for himself and his line, before he began the chapel which bears his name and contains his tomb at Westminster Abbey. Some years later the unfinished chapel was given by Henry VIII. to Cardinal Wolsey, and for long after it was known as "Wolsey's tomb-house." Wolsey engaged a Florentine sculptor named Benedetto, probably a son or nephew of Benedetto da Maiano (d. 1497), also a Florentine artist, to make him a costly tomb of marble and gilt bronze, with a recumbent effigy at the top, no doubt similar in design to Torrigiano's tomb of Henry VII. at Westminster. The rich bronze work of Wolsey's tomb has been torn off and melted by order of the Commonwealth, and the metal was sold for the then large sum of £600. In 1505 the black marble sarcophagus, stripped of its bronze ornaments, was moved from Windsor and used as a monument over Nelson's grave in the crypt of St Paul's. Though Wolsey's tomb-house was roofed in and used for mass by James I., the stone vaulting was not completed until the whole chapel was fitted by Sir Gilbert Scott as a memorial to Albert, Prince Consort. Its internal walls were then lined with rich marbles, and decorated with reliefs by Baron Triqueti. The cenotaph of the Prince Consort stands alone on the altar, with the tombs of Prince Leopold, duke of Albany, and the duke of Clarence; the last erected by King Edward VII., who was himself buried here in May 1910. In a vault beneath the chapel George III. and members of his family are buried.

The castle of St George is one of the finest examples of Perpendicular architecture in England, comparable with two other royal chapels, that of King's College at Cambridge and that of Henry VII. at Westminster, which are a little later in date. The building was begun by Edward IV., who in 1473 pulled down the old chapel, which had been erected north, west and south of the building of Edward III., and filled with stained glass by Edward III. in 1355. The nave of St George's was vaulted about the year 1490, but the choir groining was not finished till 1507; the hanging pendants from the fan vaulting of the choir mark a later development of style, which contrasts strongly with the simpler lines of the earlier nave vault. In 1516 the lantern and the roof-screen were completed, but the stalls and other fittings were not finished till 1519. The chapel ranks next to Westminster Abbey as a royal mausoleum, though no king was buried there before Edward IV., who left directions in his will that his body should be placed beside that of Jane Seymour, in a magnificent bronze and marble tomb. The tomb was never completed, and what existed of its metal-work was probably melted down by the Commonwealth. No trace of it remains. Charles I. was buried here without service in 1649. Above the dark oak stalls hang the historic insignia of the Knights of the Garter, their swords, helmets and banners. On the stalls themselves appear a remarkable series of enamelled brass plates commemorating knights of the order. Many tombs and memorials are seen in the chantry chapels.

WINDSOR CASTLE.
The deanery, adjoining the dean's cloister, is dated 1500, but the Winchester tower to the north-east of it is the work of the famous prelate and architect William of Wykeham, who was employed by Edward III. on the greater part of this extension and alteration of Henry III.'s work. The Horseshoe cloisters were restored in Tudor style by Sir Gilbert Scott. The Norman gate on the north side of the round tower was rebuilt by Wykeham.

The site of the upper ward was built upon by Henry II., and, to a greater extent, by Edward III., but only in the foundations and lowest storey are remains of so early a period to be found. The buildings were wanting in homogeneity until their reconstruction was undertaken by Sir Jeffrey Wyattville under the direction of George IV., for Charles II. was unable to carry out a similar intention, perhaps fortunately, as Sir Christopher Wren proposed drastic alterations. Charles, however, completed the so-called Star Building, named from the representation of the star of the Order of the Garter on the north front. Here the state apartments are situated. They include the throne room, St. George's Hall, where mounted by the Order of the Garter are held, the audience and presence chambers, and the grand reception room, adorned with Gobelins tapestries, and the guard-room with armour. All these chambers contain also splendid pictures and other objects of art; but more notable in this connexion are the picture gallery, the Rubens room or king's drawing-room, and the magnificent Van Dyck room. The ceilings of several of the chambers were decorated by Antonio Verrio, under the direction of Charles II. In the royal library, which is included among the private apartments, is a fine collection of drawings by the old masters, including three volumes from the hand of Leonardo da Vinci. Here is also a magnificent series of eighty-seven portraits by Holbein, highly finished in sepia and chalk, representing the chief personages of the court of Henry VIII. There are, moreover, examples by Michangelo and Raphael, though the series attributed to these masters are not accepted as genuine in their entirety.

South of the castle, beside the Home Park, is the Royal Mews. Within the bounds of the park is Frogmore (q.v.), with the Royal Mews.

The parks.

Windsor town.

The parks.

The park is divided into two distinct parts, the home park and the Windsor Great Park, which is the larger. The home park is about 500 acres, and contains some fine examples of Grinling Gibbons' wood-carving. There are statues of King George III. and Queen Victoria, unveiled in the Jubilee year 1887, and of Prince Albert (1890). The town hall was built in 1686 by Sir Christopher Wren, who represented the borough in parliament. The town was formerly celebrated for the number of its inns, of which there were seventy in 1650. The most famous were the "Garter" and the "White Hart," the first of which was the favourite of Shakespeare's Sir John Falstaff, and is frequently mentioned in The Merry Wives of Windsor. The borough is under a mayor, 6 aldermen and 18 councillors. Area, 2717 acres.

History.—Windsor (Wyndeshour, Wyndese, Windlesore) was probably the site of a Roman settlement, two Roman tombs having been discovered at Tyle-Place Farm in 1865, while a Roman camp and various antiquities were unearthed at St. Leonard's Hill in 1765. The early history of Windsor centres round the now unimportant village of Old Windsor, which was a royal residence under Edward the Confessor; and Robert of Gloucester relates that it was at a fair feast which the king held there in 1053 that Earl Godwin met with his tragic end. By the 12th century it was an important town and market, and was recovered in exchange for two other manors by William I., who erected the castle about 2 m. north-west of the village and within the manor of Clewer, round which the later important town of New Windsor was to grow up. The earliest existing charter of New Windsor is that from Edward I. in 1277, which was confirmed by Edward II. in 1315-1316 and by Edward III. in 1328. This constituted it a free borough and granted to it a guild merchant and other privileges. The same king later leased it as feoff to the burgesses on condition that they "did justice to merchants, citizens and alien and to the poor." The town does not seem to have become prosperous and its extent was reduced by several succeeding sovereigns. In 1439 extensive privileges were accorded the burgesses by Henry VI., and Edward IV. in 1467 granted a charter of incorporation under the title of the "mayor, bailiffs and burgesses." Further confirmations of existing privileges were granted by Edward IV. in 1477, by Henry VII. in 1499, by Henry VIII. in 1515 and by Edward VI. in 1549. A fresh charter was granted by James I. in 1603, and the renewal of this by Charles II. in 1664 incorporating the town under the title of the "mayor, bailiffs and burgesses of the borough of Windsor," retained the governing charter until 1855. By the charter of Edward I. the county gaol was fixed at Windsor, but on the petition of the men of Berkshire it was removed thence to a more central town in the reign of Edward II. New Windsor sent two members to parliament from 1302 to 1335 and again from 1446 to 1865, omitting the parliaments of 1654 and 1666; by the act of 1867 it lost one member. The market is of ancient date, and in 1273 the abbess of Burnham is said to hold markets at Burnham and Beaconsfield to the prejudice of the market at Windsor. Edward IV. in 1467 granted a fair on the feast of St. Edward the Confessor, and the charter of 1603 mentions a Saturday market and two fairs. No fairs are now held, but the Saturday market is still maintained. Windsor bridge is mentioned in the reign of Edward I.; the present structure dates from 1822. The town has never had an important industry, but has depended almost entirely upon the castle and court.

The political history of Windsor centres round the castle, at which the Norman kings held their courts and assembled their witan. Robert Mowbray was imprisoned in its dungeons in 1095, and at the Christmas court celebrated at Windsor in 1127 David of Scotland swore allegiance to the empress Maud. In 1175 it was the scene of the ratification of the treaty of Windsor. The castle was bestowed by Richard I. on Hugh, bishop of Durham, but in the next year was treacherously seized by Prince John and only surrendered after a siege. In 1217 Inglram de Ache with a garrison of sixty men gallantly held the fortress against a French force under the count de Nevers. It was a centre of activity in the Barons' War, and the meeting-place of the parliament summoned by Henry in 1261 in rivalry to that of the barons at St. Albans; two years later, however, it surrendered to Simon de Montfort. The appeal of high treason against Thomas Mowbray, duke of Norfolk, was heard by Richard II. in Windsor Castle in 1368. During the Civil War of the 17th century the castle was garrisoned for the parliament, and in 1648 became the prison of Charles, who spent his last Christmas within its walls.

See J. E. Tighe, Annals of Windsor (1858); Victoria County History: Berkshire.

WINDTHORST, LUDWIG (1812-1891), German politician, was born on the 17th of January 1812 at Kaldenhof, a country house near Osnabrück. He sprang from a Roman Catholic
family which for some generations had held important posts in the Hanoverian civil service. He was educated at the Carolinum, an endowed school at Osnabrück, and studied at the universities of Göttingen and Heidelberg. In 1836 he settled down as an advocate in Osnabrück; his abilities soon procured him a considerable practice, and he was appointed principal of the Catholic Consistorium. In 1848 he received an appointment at the supreme court of appeal for the kingdom of Hanover, which sat at Celle. In the next year the revolution opened for him, as for so many of his contemporaries, the way to public life, and he was elected as representative for his native district in the second chamber of the reformed Hanoverian parliament. He belonged to what was called the Great German party, and opposed the project of reconstituting Germany under the leadership of Prussia; he defended the government against the liberal and democratic opposition, at this time he began the struggle against the secularization of schools, which continued throughout his life. In 1851 he was elected president of the chamber, and in the same year minister of justice, being the first Catholic who had held so high an office in Hanover. As minister he carried through an important judicial reform which had been prepared by his predecessor, but had to retire from office because he was opposed to the reactionary measures for restoring the influence and privileges of the nobility. Though he was always an enemy to liberalism, his natural independence of character prevented him from acquiescing in the reactionary measures. In 1856 he resigned his office, and though he was appointed minister, but with others of his colleagues he resigned when the king refused his assent to a measure for extending the franchise. Windthorst took no part in the critical events of 1866; contrary to the opinion of many of his friends, after the annexation of Hanover by Prussia he accepted the post of governor-in-chief, took the oath of allegiance, and was elected a member both of the Prussian parliament and of the North German diet. At Berlin he found a wider field for his abilities. He acted as representative of his exiled king in the negotiations with the Prussian government concerning his private property and opposed the sequestration, thus for the first time being placed in a position of hostility to Bismarck. He was recognized as the leader of the Hanoverians and of all those who opposed the "revolution from above." He took a leading part in the formation of the party of the Centre in 1870, but he did not become a member of it, fearing that his reputation as a follower of the king of Hanover would injure the party, until he was formally requested to join them by the leaders.

After the death of Hermann von Mallinckrodt (1821-1874) in 1875, Windthorst became leader of the party, and maintained that position till his death. It was chiefly owing to his skill and courage as a parliamentary debater and his tact as a leader that the party held its own and constantly increased in numbers during the great struggle with the Prussian government. He was especially exposed to the attacks of Bismarck, who attempted personally to discredit him and to separate him from the rest of the party. And he was far the ablest and most dangerous critic of Bismarck's policy. The change of policy in 1879 led to a great alteration in his position: he was reconciled to Bismarck, and was made a member of the Prussian government. But, however, was his position so difficult as during the negotiations which led to a repeal of the May laws. In 1887 Bismarck appealed to the pope to use his authority to order the Centre to support the military proposals of the government. Windthorst took the responsibility of keeping the papal instructions secret from the rest of his party and of disobeying them. In a great meeting at Cologne in March 1887 he defended and justified his action, and claimed for the Centre full independence of action in all purely political questions. In the social reform he supported Bismarck, and as the undisputed leader of the largest party in the Reichstag he was able to exercise influence over the action of the government after Bismarck's retirement. His relations with the emperor William II. became very cordial, and in 1891 he achieved a great parliamentary triumph by defeating the School bill and compelling Gossler to resign. A few days afterwards he died, on the 14th of March 1891, at Berlin. He was buried in the Marienkirche in Hanover, which had been erected from the money subscribed as a testimonial to himself. His funeral was a most remarkable display of public esteem, in which nearly all the ruling princes of Germany joined, and was a striking sign of the position to which, after twenty years of incessant struggle, he had raised his party. Windthorst was undoubtedly one of the greatest of German parliamentary leaders: no one equalled him in his readiness as a debater, his distinctive eyesight compelling him to defend entirely upon his memory. It was his misfortune that nearly all his life was spent in opposition, and he had no opportunity of showing his abilities as an administrator. He enjoyed unbounded popularity and confidence among the German Catholics, but he was in no way an ecclesiastical: he was at first opposed to the Vatican decrees of 1870, but quickly accepted them after they had been proclaimed. He was a very agreeable companion and a thorough man of the world, singularly free from arrogance and pomposity; owing to his small stature, he was often known as "die kleine Excellenz." He married in 1839. Of his three children, two died before him; his wife survived him only a few months.

Windthorst's Ausgewählte Reden were published in three volumes (Osnabrück, 1901-1902). See also J. N. Knopp, Ludwig Windthorst: ein Lebensbild (Dresden, 1898); and Häusgen, Ludwig Windthorst (Cologne, 1907).

WINDWARD ISLANDS, a group and colony in the West Indies. They consist of the British island of St Lucia, St Vincent and Grenada, with a chain of small islands, the Grenadines, between the two latter islands. They are not a single colony, but a confederation of three separate colonies with a common governor-in-chief, who resides at St George's, Grenada. Each island retains its own institutions, and they have neither legislature, laws, revenue nor tariff in common. There is, however, a common court of appeal for the group as well as for Barbados, composed of the chief justices of the respective islands, and there is also a common audit system, while the islands unite in maintaining certain institutions of general utility. The Windward Islands, which, as a geographical division, probably include Barbados, derive their name from the fact that they are the most exposed of the Lesser Antilles to the N.E. Trade, the prevailing wind through the West Indies.

WINE (Lat. vinum, Gr. oinos), a term which when used in its modern sense without qualification designates the fermented product of grape juice. The fermented juices of other fruits or plants, such as the date, ginger, plum, &c., are also termed wine, but the material from which the wine is derived is in such a case denoted by the article used. The present article deals solely with wine derived from the grape (see Vinæ).

Historical.—The art of viticulture or wine-making is a very ancient one. In the East it dates back almost as far as we have historical records of any kind. In Egypt and in Greece the introduction of wine was ascribed to gods; in Greece to Dionysus; in Egypt to Osiris. The Hebrews ascribed the art of wine-making to Noah. It is probable that the discovery that an intoxicating and pleasant beverage could be made from grape juice was purely accidental, and that it arose from observations made in connexion with crushed or bruised wild grapes, much as the mastication of beer, or in its earliest form, mead, may be traced back to the accidental fermentation of wild honey. In ancient times the cultivation of the vine indicated a relatively settled and stable form of civilization, inasmuch as the vine requires a considerable maturation period. It is probable, therefore, that viticulture was introduced subsequent to the raising of cereal crops. The Nabataeans were forbidden to cultivate the vine, the object being to prevent any departure from their traditional nomadic habits. The earliest examples of specific wines of which we have any record are the Chalybou wine, produced near Damascus, in which the Phoenicians traded in the time of Ezekiel (xxvii. 18), and which at a later date was much appreciated by the Persian kings; and the wines from the Greek islands (Chios, Lesbos, Cos). With regard to the introduction of the vine into other parts of Europe, it appears that it was brought to Spain
WINE

by the Phoenicians, and to Italy and southern Gaul from Greece. In the earliest Roman times the vine was very little cultivated in Italy, but gradually Rome and Italy generally became a great wine-producing country. At a later date the republic sought to stimulate its home industry by prohibiting the importation of wine, and by restricting its cultivation in the colonies, thus preserving the latter as a useful market for Italian wines. According to Pliny, Spanish, Gallic and Greek wines were all consumed in Rome during the 1st century of the Christian era, but in Gaul the production of wine appears to have been limited to certain districts on the Rhone and Gironde. The cultivation of the vine in more northern parts (i.e. on the Seine and Moselle) was not commenced until after the death of Probus. Owing to no doubt to the difficulties of transportation, wine was, in the middle ages, made in the south of England, and in parts of Germany, where it is now no longer produced (cf. Hchn., Culturepflanzen, &c., and Mommsen, Römische Geschichte, v. 98 et seq.).

WINE-MAKING

The dwarf form of cultivation now common in northern Europe does not appear to have obtained to any extent. It seems likely that the quality of the wine produced in ancient times was as scarce as that of the modern product, inasmuch as the addition of resin, salts and spices to wine was a common practice. With regard to the actual making of the wine, this does not appear to have differed very much in principle from the methods obtaining at the present day. Plastering appears to have been known at an early date, and when the juice of the grapes was too thin for the production of a good wine, it was occasionally boiled down with a view to concentration. The first wine receptacles were made of skins or hides, treated with oil or resin to make them impervious. Later, earthenware vessels were employed, but the wooden cask—perhaps the first—that came into use, the glass bottle—was not generally known until a much later period.

Production.—The total wine production of the world, which, of course, fluctuates considerably from year to year, amounts to roughly 3000 million gallons. France and Italy are the chief wine-producing countries, the former generally producing rather more than the latter. During the phylloxera period Italy in some years had the greater output (e.g. 1886-1888 and 1890-1892). The average production of the chief wine-producing countries will be gathered from the following table:

Wine Production. Average Annual Production in Millions of Gallons for Quinquennial Periods.

The United States produces roughly 50, Bulgaria and Rumania each 40 and Servia 10 million gallons. The United Kingdom produces no wine, but the Cape and the Australian Commonwealth each produce some 5 million gallons.

The variation from year to year in the quantity of wine produced in individual countries is, of course, far greater than that observed in the case of beer or spirits. Thus, owing to purely climatic vagaries, the Italian production in 1895 was 69 million gallons, whereas in 1896 it amounted to 111 million. Similarly the French production, which was 587 million gallons in 1895, amounted to no less than 1482 million in 1900. In the same way the Italian production has varied between 583 million gallons (1895) and 793 millions (1901), and the Spanish between 331 million gallons in 1896 and 656 millions in 1892.

Consumption.—It is only natural that the consumption of wine should be greatest in the countries where it is produced on the largest scale, but the discrepancy between the consumption of different countries is little short of astonishing. Thus, at the present time, the consumption per head in France is practically a hundred times that of the United Kingdom and twenty times that of Germany—the latter it must be remembered, being itself an important wine-producing area.

The following table will give some idea of the relative consumption of wine in different countries:

Average Consumption of Wine per Head of Population.

1 Has varied between 1-9 and 3-7.

The wine of the wine consumed in the United Kingdom is imported. On the average somewhat more than one-third of the wine imported is derived from France, and about a quarter from Spain and Portugal respectively.

Wines imported into the United Kingdom in 1906.

1 The quantity of port received was exceptionally large. The average quantity is rather under 3 million gallons and the value about £800,000.
2 A considerable proportion of the German wines come to the United Kingdom via the Netherlands.

Of the wines imported from France, about one-quarter was Champagne and Saumur, the remainder consisting almost entirely of still wines, such as claret and burgundy.

VITICULTURE AND WINE-MAKING

General Considerations.—Although the wine is cultivated in practically every part of the world possessing an appropriate climate and soil, from California in the West to Persia in the East, and from Germany in the North to the Cape of Good Hope and some of the South American republics in the South, yet, as is the case also with the cereal crops and many fruits and vegetables, the wines produced in countries possessing temperate climates are—when the vintage is successful—finer than those made in hot or semi-tropical regions. Although, for instance, the wines of Italy, Greece, the Cape, &c., possess great body and strength, they cannot compare as regards elegance of flavour and bouquet with the wines of France and Germany. On the other hand, of course, the vintages of the temperate climate of northern Europe frequently lead to a partial or complete failure of the vintage, whereas the wines produced in relatively hot countries, although they undoubtedly vary in quality from year to year, are rarely, if ever, total failures. The character of a wine depends mainly (a) on the nature of the soil; (b) on the general type of the climate; (c) on the variety of vine cultivated. The quality, as distinct from general character, depends almost entirely on
the vintage, i.e. on the weather conditions preceding and during the gathering of the grapes and the subsequent fermentation. Of all these factors, that of the nature of the soil on which the vine is grown is perhaps the most important. The same vine, exposed to practically identical conditions of climate, will produce markedly different wines if planted in different soils. On the other hand, different varieties of the vine, provided they are otherwise not unsuitable, may, if planted in the same soil, after a time produce wines which may not differ seriously in character. Thus the planting of French and German vines in other countries (e.g. Australia, the Cape) has not led to the production of dis- comparable wines, although there may at first have been some general resemblance in character. On the other hand, the replanting of some of the French vineyards (after the ravages due to the phylloxera) with American vines, or, as was more generally the case, the grafting of the old French stock on the hardy American roots, resulted, after a time, in many cases, in the production of wines practically indistinguishable from those formerly made.

Wine-making.--The art of wine-making is, compared with the manufacture of beer or spirits, both in principle and in practice, a relatively simple operation. When the grapes have attained to maturity they are collected by hand and then transferred in baskets or carts to the press house. After the staves have been removed either by hand or by a simple apparatus the juice is expressed either—as is still the case in many quarters—by trampling under foot or by means of a simple lever or screw press or by rollers. In the case of red wines the skins are not removed, inasmuch as it is from the latter that the colour of the wine is derived. The must, as the expressed juice of the grape is termed, is now exposed to the process of fermentation, which consists essentially in the conversion of the sugar of the must into alcohol and various subsidiary products. The fermenting operations in wine-making differ radically from those obtaining in the case of beer or of spirits in that (if we except certain special cases) no yeast is added from without. Fermentation is induced spontaneously by the yeast cells which are always present in large numbers in the grape itself. The result is that—as compared with beer or spirits—the fermentation at first is relatively slow, but it rapidly increases in intensity and continues until practically the whole of the sugar is converted. In the case of the production of certain sweet wines (such as the sweet Sauternes, Port and Tokay) the fermentation only proceeds up to a certain extent. It then either stops naturally, owing to the fact that the yeast cells will not work rapidly in a liquid containing more than a certain percentage of alcohol, or it is stopped artificially either by the addition of spirit or by other means which will be referred to below. As the character of a wine depends to a considerable extent on the nature of the yeast (see Fermentation), many attempts have been made of late years to improve the character of inferior wines by adding to the unfermented must a pure culture of yeast derived from a superior wine. If pure yeast is added in this manner in relatively large quantities, it will tend to predominate, inasmuch as the number of yeast cells derived from the grapes is at the commencement of fermentation relatively small. In this way, by making pure cultures derived from some of the finest French and German wines it has been possible to lend something of their character to the inferior growths of, for instance, California and Australia. It is not possible, however, by this method to entirely reproduce the character of the wine from which the yeast was derived inasmuch as this depends on other factors as well, particularly the constitution of the grape juice, conditions of climate, &c. The other micro-organisms naturally present in the must which is pitchèd with the pure culture are not without their influence on the result. If it were possible to sterilize the must prior to pitching with pure yeast no doubt better results might be obtained, but this appears to be out of the question inasmuch as the heating of the must which sterilization involves is not a practicable operation. After the main fermentation the wine is stored in tanks or casks. The general method followed is to fill the casks to the bung-hole and to keep them full by an occasional addition of wine. The secondary fermentation proceeds slowly and the carbonic acid formed is allowed to escape by way of the bung-hole, which in order to prevent undue access of air is kept lightly covered or is fitted with a water seal, which permits gas to pass out of the cask, but prevents any return flow of air. During this secondary fermentation the wine gradually throws down a deposit which forms a coherent crust, known as argol or lees. This consists chiefly of cream of tartar (bitartrate of potash), tartrate of lime, yeast cells and of alluminous and colouring matters. At the end of some four to five months this primary deposition is practically finished and the wine more or less clear and bright. At this stage it receives its first racking. Racking consists merely in separating the bright wine from the deposit. The wine is racked into clean casks, and this operation is repeated at intervals of some months, in all three to four times. As a general rule, it is not possible by racking alone to obtain the wine in an absolutely bright condition. In order to bring about this, a further operation, namely that of fining, is necessary. This consists, in most cases, in adding to the wine proteid matter in a finely divided state. For this purpose isinglass, gelatin or, in the case of high-class red wines, which is itself in many cases included in the grape, is used. This is a part of the tannin in the wine, forming an insoluble tannate, and this gradually subsides to the bottom of the cask, dragging with it the mechanically suspended matters which are the main cause of the wine’s turbidity. In some cases purely mechanical means such as the use of Spanish clay or filtration are employed for fining purposes. Some wines, particularly those which lack acid or tannin, are very difficult to fine. The greatest care is necessary to ensure the cleanliness and asepticity of the casks in which wine is stored or into which it is racked. The most common method of ensuring cask cleanliness is the operation known as “sulphuring.” This consists in burning a portion of a sulphur “match” (i.e. a flat wick which has been steeped in melted sulphur, or simply a stick of melted sulphur) in the interior of the cask. The sulphurous acid evolved destroys such micro-organisms as may be in the cask, and in addition, as it reduces the supply of oxygen, renders the wine less prone to acridulous fermentation. Sweet wines, which are liable to fret, are more highly and frequently sulphured than dry wines. After the wine has been sufficiently racked and fined, and when it has reached a certain stage of maturation—varying according to the type of wine from, as a rule, two to four years—the wine is ready for bottling. Certain wines, however, such as some of the varieties of port, are not bottled, but are kept in the wood, at any rate for a considerable number of years. Wines so preserved, however, develop an entirely different character from those placed in bottle.

Chemistry of Wine

Maturation of the Grapes.—The processes which take place in the grape during its growth and maturation are of considerable interest. E. Mach has made some interesting observations on this point. At first—i.e. at the beginning of July when the berries have attained to an appreciable size—the specific gravity of the juice is very low; it contains very little sugar, but a good deal of acid, chiefly free tartaric acid and malic acid. The juice at this period contains an appreciable amount of tannin. As the amount of sugar gradually increases, and the same up to a certain point applies to the acidity. The character of the acidity, however, changes, the free tartaric acid gradually disappearing, the acid of potash and being otherwise broken up. On the other hand, the free malic acid increases and the tannin decreases. When the grape is ripe, the sugar has attained to a maximum and the acidity is very much reduced; the tannin has entirely disappeared.

The following figures obtained by Mach afford an interesting illustration of these processes:

At first the sugar in the juice consists entirely of dextrose, but later sucrose (lascvulose) is formed. The sugar in ripe grape juice is practically invert sugar, i.e. consists of practically equal parts of dextrose and fructose. The proportion of sugar present in the juice of ripe grapes varies considerably according to the variety,

In temperate climates it varies as a rule between 15 and 20%, but in the case of hot climates or where the grapes are treated in a special manner, it may rise as high as 35% and in some cases more.

Fermentation.—The fermentation of grape juice, i.e. the must, is, as we have seen, a relatively simple operation, consisting as it does in exposing it to the spontaneous action of the micro-organisms contained in it. The main products formed are, as in all cases of
alcoholic fermentation, ethyl alcohol, water and carbonic acid. At the beginning of alcoholic products such as glycerin, succinic acid, small quantities of hydrochloric acid and apparent "greenness." It has been found by experience also that wines which are normally constituted as regards the relative proportions of their various constituents, whether the grapes of which they are composed do not fall below certain limits, are likely to develop well, whereas wines which, although perfectly sound, show an abnormal constitution, will rarely turn out successful. The bouquet of young wines depends principally on compound esters which in a proportion of the stages will turn out well. On the contrary, it is frequently the case that the most successful wines in after years are those which at first show very little bouquet. The maturation of wine, whether it be in bottle or in cask, is an exceedingly interesting operation. The wines which remain for a long period in cask gradually lose alcohol and water by evaporation, and therefore become in time extremely low in regard to solid and relatively non-volatile matters contained in them. As a rule, it is nowadays held that a wine in cask become very dry, and the loss of alcohol by evaporation—particularly in the case of light wines—has as a result the production of glycol or ethylene glycol. These processes are of such a nature that absolutely a very large quantity of acid, they may not appear acid to the palate inasmuch as the other constituents, particularly the glycerin and gummy matters, will have likewise increased in relative quantity. The results of the maturation process in the cask of some of the vintage wines is the mellowning of the somewhat hard taste associated with new wine and the development of the special characteristic of each vintage. The mellowning effect of age is due to the deposition of a part of the tannin and some of the colouring matter. The mechanism of the development of the secondary bouquet appears to be dependent first on the moulds which grow on the surface of the wine, and secondly on the life activity of certain micro-organisms. L. Pasteur filled glass tubes entirely with new wine and then sealed them up. It was found that wine so treated remained unchanged in all of its properties. On the contrary, the temperature rise above 15° fermentation is liable to be too rapid, too much alcohol is formed at a relatively early stage, and the result is that the fermentation process before the whole of the sugar has been transformed. Wines which have received a check of this description during the main fermentation are very liable to bacterial troubles and frets. In the case of wines made in more southerly latitudes temperatures between 25° and 30° C. are not excessive, but temperatures appreciably over 30° frequently lead to mischief. The young wine immediately after the cessation of the main fermentation is very differently constituted from the must from which it was derived. The sugar, as we have seen, has been transformed, and alcohol and carbonic acid have been produced. At the same time the acidity is markedly reduced. This reduction of acidity is partly due to the deposition of various salts of tartaric acid and is soluble in a dilute alcoholic solution much less in medium than in water, and partly to the activity of micro-organisms. Young wines differ very widely in their composition according to class and vintage. The alcohol in naturally fermented wines may vary between 7 and 16%, although there are exceptions to this general statement. The acidity may vary between 0.3 and 1% according to circumstances. The normal proportion of glycerin varies between 7 and 14 parts for every 100 parts of alcohol in the wine, but even these limits are frequently reached or exceeded. The total solid matters of "extract," as it is called, will vary between 1.5 and 3.5% for dry wines, and the mineral matter or ash generally amounts to about one tenth of the extract. The tannin in young red wines may amount to as much as 0.4 or 0.5% but in white wines it is much less. The amount of volatile acid should be very small, and, except in special cases, a percentage of volatile acid of o.1 to 0.15% according to the class of wine, will indicate that an abnormal or undesirable fermentation has taken place. As the wine matures the most noticeable feature in the first instance is the reduction in the alcohol, which is mainly due to a deposition of tannar, and the disappearance of tannin and colouring matter, due to fining and the action of oxygen. The taste and bouquet of wines in the earlier stages of their development is in many instances due to constituents derived from the grape, either directly or as a result of the main fermentation. In the case of dry wines, the quality which is known as "body" (palate-fullness) is dependent on the solid constituents. These comprise gumminess and albuminous matters, acid, salts, glycerin and other matters of which we have so far little knowledge. The appearance of bouquet in the wine, however, is not merely dependent upon the quantity of solid—constituents, but is influenced also by the relative proportions in which the various constituents exist. For instance, a wine which under favorable conditions would seem full and round may appear harsh or rough, merely owing to the fact that it contains a small quantity of ethyl alcohol, whereas a wine which is perfect in every respect but is acid and apparently "greenness." It has been found by experience that wines which are normally constituted as regards the relative proportions of their various constituents, whether the grapes of which they are composed do not fall below certain limits, are likely to develop well, whereas wines which, although perfectly sound, show an abnormal constitution, will rarely turn out successful. The bouquet of young wines depends principally on the compound esters which in a proportion of the stages will turn out well. On the contrary, it is frequently the case that the most successful wines in after years are those which at first show very little bouquet. The maturation of wine, whether it be in bottle or in cask, is an exceedingly interesting operation. The wines which remain for a long period in cask gradually lose alcohol and water by evaporation, and therefore become in time extremely low in regard to solid and relatively non-volatile matters contained in them. As a rule, it is nowadays held that a wine in cask become very dry, and the loss of alcohol by evaporation—particularly in the case of light wines—has as a result the production of glycol or ethylene glycol. These processes are of such a nature that absolutely a very large quantity of acid, they may not appear acid to the palate inasmuch as the other constituents, particularly the glycerin and gummy matters, will have likewise increased in relative quantity. The results of the maturation process in the cask of some of the vintage wines is the mellowning of the somewhat hard taste associated with new wine and the development of the special characteristic of each vintage. The mellowning effect of age is due to the deposition of a part of the tannin and some of the colouring matter. The mechanism of the development of the secondary bouquet appears to be dependent first on the moulds which grow on the surface of the wine, and secondly on the life activity of certain micro-organisms. L. Pasteur filled glass tubes entirely with new wine and then sealed them up. It was found that wine so treated remained unchanged in all of its properties. On the contrary, the temperature rise above 15° fermentation is liable to be too rapid, too much alcohol is formed at a relatively early stage, and the result is that the fermentation process before the whole of the sugar has been transformed. Wines which have received a check of this description during the main fermentation are very liable to bacterial troubles and frets. In the case of wines made in more southerly latitudes temperatures between 25° and 30° C. are not excessive, but temperatures appreciably over 30° frequently lead to mischief. The young wine immediately after the cessation of the main fermentation is very differently constituted from the must from which it was derived. The sugar, as we have seen, has been transformed, and alcohol and carbonic acid have been produced. At the same time the acidity is markedly reduced. This reduction of acidity is partly due to the deposition of various salts of tartaric acid and is soluble in a dilute alcoholic solution much less in medium than in water, and partly to the activity of micro-organisms. Young wines differ very widely in their composition according to class and vintage. The alcohol in naturally fermented wines may vary between 7 and 16%, although there are exceptions to this general statement. The acidity may vary between 0.3 and 1% according to circumstances. The normal proportion of glycerin varies between 7 and 14 parts for every 100 parts of alcohol in the wine, but even these limits are frequently reached or exceeded. The total solid matters of "extract," as it is called, will vary between 1.5 and 3.5% for dry wines, and the mineral matter or ash generally amounts to about one tenth of the extract. The tannin in young red wines may amount to as much as 0.4 or 0.5% but in white wines it is much less. The amount of volatile acid should be very small, and, except in special cases, a percentage of volatile acid of o.1 to 0.15% according to the class of wine, will indicate that an abnormal or undesirable fermentation has taken place. As the wine matures the most noticeable feature in the first instance is the reduction in the alcohol, which is mainly due to a deposition of tannar, and the disappearance of tannin and colouring matter, due to fining and the action of oxygen. The taste and bouquet of wines in the earlier stages of their development is in many instances due to constituents derived from the grape, either directly or as a result of the main fermentation. In the case of dry wines, the quality which is known as "body" (palate-fullness) is dependent on the solid constituents. These comprise gumminess and albuminous matters, acid, salts, glycerin and other matters of which we have so far little knowledge. The appearance of bouquet in the wine, however, is not merely dependent upon the quantity of solid—constituents, but is influenced also by the relative proportions in which
another. The great epidemic in the French vineyards in the years 1882 to 1885 led to a reduction of the yield of about 50%. Many remedies have been suggested, but none have been successful. The submersion of the vineyards, the use of carbon bisulphide for spraying, and of copper salts, but there appears to be little doubt that a really serious epidemic can only be dealt with by systemic destruc-
tion. But this may result in the loss of the grape crop. The prevent-
ion of bad weather, a feasible method, is almost impossible. This,
of course, naturally leads to the production of a wine somewhat
different in character to that produced before the epidemic, but this
difficulty may possibly have been reduced if the grape crop was in time
grafted ancient stock on the roots of new and resistant vines.

Oidium or mildew is only second in importance to the
phyloxera. It is caused by a species of mould which lives on the
green fruits of the vine, from which the leaves, blossoms, and the
grapes that are formed also shrivel and die. The most
effective cure, short of destruction and replantation, appears to be
spraying with finely divided sulphur. Another evil, which
can cause a more serious damage, is the flowering, known as
colour, which is, or a later period the young fruit, to fall off the growing plant in large
numbers.

Diseases of Wine.—These are numerous, and may be derived either
directly from the vine, from an abnormal constitution of the grape
juice, or to subsequent infection. Thus the disease known as tourne
or case is generally caused by the wine having been made or partly
made from grapes affected by mildew. The micro-organism giving
rise to this disease generally appears in the form of small jointed rods
and is termed the micro-organism of the wine. It is known that this
by this disease loses its colour and flavour. The colour in the case
of red wines is first altered from red to brown, and in bad cases
disappears altogether, leaving an almost colourless solution. This
disease is caused by the wine and by the residual acids, and to the
presence of the excess of aluminous matters. The most
common disease to which wine is subject by infection is that caused
by a micro-organism termed muscoidina vinet (French fleurs de vin).
This micro-organism, which resembles ordinary yeast cells in appear-
ance, forms a pellicle on the surface of the wine, particularly when the
latter is exposed to the air more than it should be, and its develop-
ment is favoured by lack of alcohol. The micro-organism itself
fermentation, differs from the disease caused by M. vini that the
alcohol is transformed into acetic acid. It is caused by a micro-
organism termed aceto-Bouil, and wine in small
grooves and chambers of round cells. It is principally due to a lack of
alcohol in the wine or to lack of acidity in the must. The
micro-organism which causes the disease of bitterness (acer) forms longish
branched filaments in the wine. Hand in hand with the development of a
disagreeable bitter taste there is a precipitation of colouring
matter and the formation of certain disagreeable secondary con-
stituents. This disease is generally caused by infection and is
favoured by lack of alcohol, acidity, and a temperature which generally occurs only in white wines is that which converts
the wine into a thick stringy liquid. It is the viscous or praire
disease, the cause of disease is due to the presence of tartaric
more frequent occurrence in white wines). The mannitie
disease, which is due to high temperatures during fermentation and lack of
acid in the must, is rarely of serious consequence in temperature
countries. A similar organism supplies mannite, in varying
forming mannitol and different acids, particularly volatile acid.
The wine becomes turbid and acquires a peculiarly bitter sweet
taste, and if the disease goes further becomes quite undrinkable.
It would appear from the researches of the author and others that the
mannitol ferment is more generally present in wines than is
supposed to be the case. Thus the author found in very old and
two wines very appreciable quantities of mannitol. In most
cases the mannitic fermentation had obviously not developed to any
extent, and small quantities of mannitol appear to exercise no
nuiseful effect on flavour.

Pasteurization.—It was found by Pasteur that by heating
wine out of contact with air to about 66° C. the various germs
causing wine maladies could be checked in their action or destroyed.
The one disadvantage of this method is that unless very carefully
applied the normal development of the wine may be seriously
retarded. In the case of cheap wines or of wines which are already
more or less mature, this is not a matter of any great importance, but
the delicacy and sweetness of the best wines is serious if this
Pasteurizing alone, however, will only avail in cases where the disease
has not gone beyond the initial stages, inasmuch as it cannot restore
colour, taste or aroma where these have already been lost.
In such cases it is also useless where the disease is not
applicable, some direct treatment with a view to eliminating or adding con-
stituents which are in excess or lacking is indicated. In this regard it
is of the greatest importance to draw the inference that there is a
rational and scientific method for preventing waste of good material and
sophistication pure and simple. It appears to the author, how-
never, that where such methods are employed merely with a view to
overcoming a specific malady and there is no intention of increasing
the quantity of the wine for purposes of gain, or of giving a fictitious
appearance of quality, these operations are perfectly justifiable and
may be practised without any reproach. But if they are
based upon the brewer or distiller who has to deal with somewhat abnormal
raw material. It has been found, for instance, that in the case of the
mannitic disease the action of the micro-organism may be
neutralized or prevented by raising the temperature of the
wine up to a certain level by the addition of a small quantity of tartaric
acid. Again, it is well known that in the case of the viscous
disease the latter can be prevented by spraying the
wine with a solution of tannin. In the same way the disease caused by the mildew
organism may be counteracted by a slight addition of alcohol and tartaric
acid. One method of assisting nature in wine-making, which is,
in consideration of the prevalence of the plant disease
is sold as wine or in such a manner as to indicate that it is natural
wine, is the process termed "gallicizing," so called from its inventor
H. L. L. Gall, which has been largely practised, particularly on the
Rhine. The process of Gall consists in that shortly after the
flowering, it is scarcely necessary to say that the indiscriminate addition
of alcohol and water, or of either must or to wine, must be regarded as
an inefficient operation.

Plastering.—In some countries, particularly in Italy, Spain and
Portugal, it has been and still is a common practice to add a small
quantity of gypsum to the fermenting must or to dust it over the
grapes prior to pressing. It is said that wines treated in this
wine, and their maturity more quickly, and that they are more stable and of better
colour. It certainly appears to be the case that musts which are
plastered rather suffer from abnormal fermentation, and that the
wines which result very rarely turn acid. The main result of
plastering is that the soluble tartrates in the wine are decomposed,
forming insoluble tartrate of lime and soluble sulphate of potash.
It is also stated that it is generally more successful the latter is undertake on wine, and
unless the quantity appreciably exceeds two grams per litre, no
reasonable objection can be raised.

Wines in Air.—Wines which are made not from fresh grape juice
but from raisins or concentrated must, or similar material, are gener-
tically termed basis wines. They are prepared by adding water to the
concentrated saccharine matter and subsequently pitching with
wine yeast at an appropriate temperature. Frequently alcohol,
tannin, glycerin, and similar wine constituents are also added. If
carefully prepared there is no objection to these basis wines from a
hygienic point of view, although they have not the delicate qualities
of wines made from fresh grapes. Another objection to these wines is that
these wines have in the past been vended on a large scale in a manner
calculated to deceive the consumer as to their real nature, but
without any measurable operation.

Wines of France.—It may be safely said that there is no other country in which
the general conditions are so favourable for the production of
wine of high quality and on a large scale as is the case in France.
The climate is essentially of a moderate character; the winters
are rarely very cold, and the summers are seldom of the intensely
hot and dry nature which is characteristic of most southerly
wine countries. There are large tracts of gently undulating or
relatively flat country which is, inasmuch as it ensures effective
exposure of the vines to the sun, of a type particularly suited
to viticulture. There is almost everywhere an efficient supply of
water, and rarely the character of the soil is in many parts an ideal
one for the production of wine of high quality and abundance in
quantity. It may here be stated that a rich soil such as is suitable
for the growth of cereal crops or vegetables is not, as a rule, an
ideal one for the production of fine wines. The ideal soil for vine-
growing is that which possesses a sufficiency, but not an excess, of
nutriment for the plant, and which is so constituted that it will
afford good drainage. The most important qualification, however,
is that it should be so constituted as to preserve and store up
during the relatively cold weather the heat which it has derived
from the summer sun. To this end the famous Bordeaux or Gironde district is, perhaps, more fortunate
than any other part of the world. The thirsty and methodical
habits of the French peasantry, and also the system of small holdings which prevails in France, have, there is little doubt, done much to raise the French wine industry to the pre-eminent position which it holds. There is perhaps no branch of agriculture which requires more minute attention or for which a system of small holdings is more suitable than wine culture. At the present day, wine is produced in no less than 77 départements in France, the average total yield during the past ten years being roughly 1000 million gallons. This is considerably more than the average produced previous to the phylloxera period (1882-1897). The highest production on record was in the year 1900, when over 1840 million gallons were produced. In the heart of France produces such enormous quantities of wine it is a remarkable fact that more wine is imported into France than is exported from that country. The average imports are in the neighbourhood of 120 million gallons, of which rather more than one-half comes from Algeria. The exports amount to roughly 40 million gallons. Of recent years (1896-1907) the only vintages which have been deficient as regards quantity are those of 1897, 1898, 1902 and 1903, but even in the most unfavourable of these years (1898) the quantity exceeded 700 million gallons. The greatest yield ever recorded over the entire country was in 1900, when over 1840 million gallons were produced. The number of different varieties of wines produced in France is remarkable. The red wines include the elegant and delicate (though not unstable) wines of the Gironde, and again the full, though not coarse, wines of the Burgundian district. Among the white wines we have the full sweet Sauternes, the relatively dry and elegant Graves and Chablis, and the light white wines which produce champagne and brandy.

Gironde (Bordeaux) Wines.—If France is the wine-growing country, par excellence, the Bordeaux district may be regarded as the hub and centre of the French wine industry. Although other parts of France produce excellent wines, the Gironde is easily first if high and stable character, elegance and delicacy, variety and quality are considered together. The total area of the departments of the Gironde is about 23 million acres, and roughly one-fifth of this is under the vine. It forms a tract of country some 90 m. long by 60 m. broad, in which the chief vineyards are those of the Garonne, Dordogne, and their confluent the Gironde. The soil varies very considerably in its character, and it is due to these variations that so many different types of wine are produced in this district. It generally consists of limestone, or of mixed limestone and clay, or of sand and clay, or of gravel, with here and there flint and rolled quartz. The subsoil is either of clay, of limestone, or mixed sand and clay, gravel, or of a peculiar kind of pudding stone which exists in a hard and varied, or gravel, or fine gravel or a formation of sand or infiltrated oxide of iron. This stone is known locally under the name of ailles. It is generally found at a depth of about 2 ft. under the better soils of the Médoc and Graves. The subsoils of the other districts (Côtes and St Emilion) contain much stone in the shape of flint and quartz. The finest wines of the Médoc and Graves are largely grown on a mixture of gravel, quartz and sand with a subsoil of ailles or clay. The Gironde viticultural region is divided into six main districts, namely Médoc, Sauternes, Graves, Côtes, Entre-deux-Mers and Palus. Although properly belonging to the Côtes, the St Emilion district is sometimes classified separately, as indeed, having regard to the excellence and variety of its wines, it has a right to be.

Médoc.—The most important subdivision of the Gironde district is that of the Médoc. It is here that the wine which is known to us as claret is produced in greatest excellence and variety. The Médoc consists of a tongue of land to the north of Bordeaux, bounded by the Garonne and Gironde on the east, and by the sea on the west and north-west. It is roughly, 93 m. broad, and the soil varies considerably in nature, but consists mostly of gravel, quartz, limestone and sand on the surface, and of clay and ailles beneath. The principal vines grown in the Médoc are the Cabernet-Sauvignon, which is the most important, the Gros-Cabernet, the Merlot, the Carménère, the Malbec, and the Verdot. All these produce red wines. Very little white wine is made in the Médoc proper. The method of wine cultivation is peculiar and characteristic. The vines are kept very low, and as a rule only two branches or arms, which are trained at right angles to the stem, are permitted to form. This dwarf system of culture gives the Médoc wines at a distance the appearance of a sea of small bush, thereby producing an effect entirely different from, for instance, that seen on the Rhine with its high basket-shaped plants. The methods of making the wine in the Médoc are the site of the simple description. The vintage generally takes place towards the end of September or the beginning of October. The grapes from which the stalks are partly or wholly (and occasionally not at all) removed are crushed by treading or some other simple method, but sometimes even this is omitted, the juice being expressed by the weight of the grapes themselves, or by the pressure caused by incipient fermentation. Presses are not used in the case of red wines until after fermentation, when they are employed in order to separate the wine from the must. As a rule the fermentation occupies from 6 to 10 days; by this time the must has practically lost the whole of its sugar, and the young wine is drawn off and filled into hogsheads. The vinification proper is generally finished at the end of about six weeks to two months, and the first racking takes place, as a rule, in February or March. Subsequent rackings are made about June and November of the same year, but in the following years, until bottling, two rackings a year suffice. The Médoc is divided into a number of communes (such as St Julien, Margaux, Paulliac, &c.), and in these communes are situated the different vineyards from which the actual wine of the wine is derived. Unlike the products of the different vineyards of most other districts, which are purchased by the merchants and vatted to supply a general wine for commerce, the yield of the principal estates of the Médoc are kept distinct and reach the consumer as the products of a particular growth and of a particular year. This practice is almost without exception resorted to with what are known as the "classeed growths" and the superior "bourgeois" wines, whilst in seasons in which the wines are of good quality it is continued down to the lower grades. This classification of the Médoc growths became necessary owing to the great variety of qualities produced and the highly characteristic excellence of the individual vintages. There are four main classes or crus (literally growths, but more correctly types or qualities), namely, the "grand cru classés" or "classees," and the bourgeois, artisan and peasant growths. The "classeed growths," which include all the most famous wines of the Médoc, are themselves subdivided into five sections or growths. This general classification, which was made by a conference of wine brokers in 1855, as a result of many years of observation dating back to the 18th century, is still very fairly descriptive of the average merit of the wines classified. The following is a list of the clareided red wines of the Médoc (i.e. claret) together with the names of the communes in which they are situated.

### Clasped Growth of the Médoc (Claret)

#### First Growths.

- Château Lafite, Paulliac.
- * Margaux, Margaux.
- * Latour, Paulliac.

#### Second Growths.

- Château Mouton-Rothschild, Paulliac.
- * Rauzan-Ségla, Margaux.
- * Rauzan-Gassies, Margaux.
- * Léoville-Lascases, St Julien.
- * Léoville-Peyraguey, St Julien.
- * Léoville-Barton, St Julien.
- * Durfort-Vivens, Margaux.
- * Lamarque, St Emilion.
- * Gruaud-Larose-Sarget, St Julien.
- * Gruaud Larose, St Julien.
- * Brane-Cantenac, Cantenac.
- * Pichon-Longueville, Pauillac.
- * Ducru-Beaucaillou, St Julien.

#### Third Growths.

- * Cos d'Estournel, St Estèphe.
- * Château Montrose, St Estèphe.

#### Fourth Growths.

- * Château Kirwan, Cantenac.
- * D'Issan, Cantenac.
- * Lagrange, St Julien.
- * Langoa, St Julien.
- * Giscours, Lalarde.
- * Malescot, Margaux.
- * Mouton, Margaux.
- * Le Lagune, Laronde.
- * Desmirail, Margaux.
- * Calon-Ségur, St Estèphe.
- * Fleurie, Margaux.
- * Becker, Margaux.

### Fifth Growths.

- Château Saint-Pierre, St Julien.
- * Branaire-Ducru, St Julien.
- * Talbot, St Julien.
- * Duhart-Milon, Paulliac.
- * Pouget, Cantenac.
- * La Tour Carnet, St Laurent.
- * Rodet, St Julien.
- * Beychevelle, St Julien.

Le Prieuré, Cantenac.

Marquis de Termes, Margaux.
The quality of the Médoc red wines (and this applies also to some of the finer growths of the other Bordeaux districts) is radically different from that of wines similar in type grown in other parts of the world. The Gironde red wines have sufficient body and alcohol to ensure stability without being heavy or fiery. At the same time, their acidity is very low and their bouquet characteristically delicate and elegant. It is to this relatively large amount of body and absence of an excess of acid and of tannin that the peculiarly soft effect of the Bordeaux wines on the palate is due. It has been said that chemistry is of little avail in determining the value of a wine, and this is undoubtedly true as regards the bouquet and flavour, but there is no gainsaying the fact that many hundreds of analyses of the wines of the Gironde have shown that they are, as a class, distinctly different in the particulars referred to from wines of the claret type produced, for instance, in Spain, Australia or the Cape. The quality of the wine varies considerably with the vintage; but it is almost invariably the case that the wines of successful vintages will contain practically the same relative proportions of their various constituents, although the absolute amounts present of these constituents may differ widely. It is the author's experience also that where a wine displays some abnormality as regards one or more constituents, that although it may be sound, it is rarely a wine of the highest class. The tables below will give a fair idea of the variations which occur in the same wine as a result of different vintages, and the variations due to differences of "growth" in the same vintage. These figures are selected from among a number published by the author in the Journal of the Institute of Brewing, April 1907.

![WINE][WINES OF FRANCE]

**Fifth Growths.**

Château Pontet-Canet, Pauillac. 30
Batailley, Pauillac. 30
Grand-Puy-Lacoste, Pauillac. 29
Ducasse-Grand-Puy, Pauillac. 30
Château Lynch-Bages, Pauillac. 30
Lynch-Moussas, Pauillac. 30
Ducasse, Labarde. 30
Mouton-d'Armailhaucq, Pauillac. 30
Le Tertre, Arsac. 30
Haut-Bages, Pauillac. 30
Pédesclaux, Pauillac. 30
Belgrave, St. Laurent. 30
Carmesac, St. Laurent. 30
Cos-Labory, St. Estèphe. 30
Château Clerc-Milon, Pauillac. 30
Croizet-Bages, Pauillac. 30
Cantemerle, Macau. 30

Results (excepting alcohol) are expressed in grams per litre, i.e., roughly parts per thousand.

The annual output of the Gironde during the last few years has been roughly 70 to 100 million gallons. In the decade 1876 to 1886 the average amount was barely 30 million gallons owing to the small yields of the years 1881 to 1885. In the years 1874 and 1875 the yield exceeded 100 million gallons. The output of the classified growths varies considerably according to the vintage, but it is on the average, owing to the care exercised in the vineyards, greatly than that of the lower-grade areas. Thus within recent years the output of the Château Lafite was at a minimum in 1903 when only 229 hogsheads (the hogshead of claret = 46 gallons) were produced, and at a maximum in 1907, when close on 1000 hogsheads were obtained. Similarly, the Château Margaux, which yielded 1120 hogsheads in 1900, produced 290 hogsheads in 1903. The prices of the wines also are subject to great fluctuation, but in fair years will vary, according to class and quality, from £10 to £30 per hogshead for future growth.
The sparkling wine known to us as champagne takes its name from the Champaigne province which was now replaced by the département of Marne, Haute-Marne, Aube and Ardennes. The best wines, however, are grown almost exclusively in the Marne district. The cultivation of the vine in the Champagne is of very ancient date. The first white wines were produced there in the reign of the Roman emperor, Probus (in the 3rd century A.D.), and according to Victor Rendu the *groseille* which had already existed in the vineyards of the Canal de la Marne, had, in 1691, attained to the value of 1000 livres. It was at about the latter date that sparkling or effervescing wine was first made, for, according to M. Perrier, a publication of the year 1718 refers to the fact that wine of this description had then been known for some twenty years. The actual discovery of this type of wine is ascribed to Dom Pépinion, a monk who managed the cellars of the abbey of Haut Villers from 1691 to 1715. It appears also that it was this Dom Pépinion who first used small bottles for closing wine bottles. Up till then such primitive means as pads of hemp or cloth steeped in oil had been employed. It is very likely that the invention of effervescing wine, the most plausible explanation being that Dom Pépinion closed some bottles filled with partially fermented wine, with the new material, and on opening them later observed the effects produced by the confined carbonic acid gas. The art of making the wine was kept secret for some time, and many mysterious fables were circulated concerning it; inter alia it was believed that the monks had a hitherto secret process. It is true that he appears, however, to have become popular or consumed on a large scale until the end of the 18th century.

The district producing the finest champagne is divided into two distinct regions, popularly known as the river and the marne, respectively. The former consists of the vineyards situated on or in the neighbourhood of the banks of the Marne. The principal vineyards in the valley, on the right bank of the river, are those at Ay, Dix, Hautvillers and Mareuil; on the left bank, on the slopes of Epernay and parallel with the river, those at Piéry and Moussey; in the district towards the south-east, on the slopes of Avize, those of Avize, Verzenay, Vaucelles, Vertus. The "mountain" district are at Verzy, Verzenay, Silly, Rilly and Bouzy.

The soil in the champagne district consists on the slopes largely of chalk, and on the plain, a sort of clay or alluvial soil. It is interspersed with gravel and sand. The chief red wines of the champagne district are the Plant-doré, Franc-Bleu and the Plant vert doré. The Plant gris, or Meunier, yields grapes of a somewhat inferior quality. The chief white wine is the Chardonnay, also known as Vergers. The two qualities of wine are made almost exclusively from the black grapes. For this reason it is necessary that the process of collection, separation and pressing should proceed as quickly as possible at vintage time in order that the juice may not, through incipient fermentation, dissolve any of the colouring matter from the skins. For the same reason the grapes are collected in baskets in order to avoid excessive pressure. They are transported to the presses in these to the press house, where, after being heated to a temperature of 7 to 8 atmospheres or more. Formerly the loss through breakage was very great, but the art of making and selecting these bottles has greatly improved, and the loss now amounts to less than 1 per cent. This is regarded as an uncommon figure. In the spring-time, shortly after bottling, the rise in temperature produces a secondary fermentation, and this converts the sugar into alcohol and carbonic acid. This fermentation continues for a period of months, a sediment which adheres to the side of the bottle is gradually formed. The bottles, which up till now have been in a horizontal position, are then turned upside down in order to discharge the sediment that known as disgorging, placed in a slanting position, neck downwards, and are daily shaken very slightly, so that by degrees the sediment works its way on to the cork. This process, which takes place in the month of February or March, is carried on without the knowledge of the worker. When the whole of the sediment is on the cork, the iron clip, with which the latter is kept in position, is removed for a moment, and the force of the wine ejects the sediment and cork. The latter is then replaced and the cork sealed in order to avoid an excessive escape of wine. An ingenious modification has of modern times been introduced, which consists in freezing part of the wine in the neck of the cork and so preventing it from being lost.

The production of the Sauternes vineyards is, as a rule, smaller than that of the chief red growths, and in consequence of this, and that the district is a relatively small one, the prices of the finer growths are very high.

The Côtes district consists of the slopes rising from the lower marshy regions to the east of the Gironde and the Dordogne. The best of the Côtes wines are grown in the St Emilion region. This region consists of the commune of St Emilion, which forms a district of more than 3000 acres, producing wines of a decidedly bigger type than those of the Médoc, and is frequently called the Burgundy of the Bordeaux district. The classification of the St Emilion wines is very complicated, but in principle is similar to that of the Médoc, among the better known wines of the first growths are the following: Château Ausone, Château Belair, Château Clos Fourtet, Château Pavie, Château Coutet, Château Chevaleau, and a few others. They are generally employed for local consumption and blending.
Wine

[WINES OF FRANCE]

After the sediment has been removed the wine is subjected to dosage, or liqueuring. It is by this process that the degree of sweetness required to suit the particular class of wine being made is attained. For wines destined for England, a little liqueur is added to the case of some wines, known as Brud or Nature, none at all is added. Wines intended for consumption in France receive a moderate quantity of liqueur, but those for the Russian and South American markets receive more. For the latter the liqueur is made of fine wine, brandy and candied sugar. The liqueuring is nowadays generally carried out by means of a machine which regulates the quantity to a nicety. In Champagne it is now considered that the same vineyard, with the classified growths of the Gironde, the product of a single vineyard. The bulk of the wine is made in vineyards belonging to small peasant proprietors, who sell their produce to the commercial houses. To ensure the desired quality of the wine coming from the various proprietors, and the chief aim in this blending is to maintain the character of the wine which is sold under a particular trade mark or brand. Similarly, it has been said that, strictly speaking, there is no such thing as vintage champagne, for, in fact, the vintages produced in that part of the wine of a certain "vintage" will actually have been made in the year indicated. It is not unusual in the case of champagne to add some sugar to the must in the years in which the latter is deficient in this respect, and to make a legitimate objection to be raised to the fact inasmuch as champagne in any case must be regarded in the light of a manufactured article rather than as a natural product. The principal centres of the champagne trade are in the Marne, Epernay, Ay and Avize. The total output of the Marne district has for the past three years averaged about 9 million gallons, but it occasionally runs as high as 20 million gallons. A great part of this wine, however, is not suitable for making high-class champagne. As a rule the supply considerably exceeds the demand, and the stock in hand at the present time amounts to roughly four years' consumption of finished wine, but to this must be added the stock existing in cask, which is considerable. For the period 1906-1907 the total number of bottles in stock amounted to over 121 millions, the bottles exported to over 23 millions, and the bottles required for internal commerce in France to something over 10 millions. There is a practice present a total annual consumption of rather over 30 millions of bottles. The chief trade in champagne is with the United Kingdom, to the finest varieties are exported. In the year 1906, of access and of remarkably even temperature, at a very small cost. The method of manufacture is similar to that followed in the Champagne.

In the north of France, not far from the Jura, lies the oldest viticultural district of Europe, namely that of Burgundy. It is still so called, after the old French provinces, Upper and Lower Burgundy. It comprises the departments of the Yonne on the north-west, the Côte d'Or in the centre, and the Saône-et-Loire on the south. In the Yonne are made chiefly the white wines known to Burgundy. The famous villages are Chablis; in the Saône-et-Loire are made the red and white wines of Mâcon, and there is also, stretching into the departments of the Rhône, the district of the Beaujolais. The most important wines, however, the Burgundy wines proper, are made in the centre of this region on the range of low hills running north-east by south-west called the Côte d'Or, or the golden slope. The soil of the Côte d'Or is chiefly limestone, with a little clay and sand. The vineyards producing the best wines are situated about half-way up the slopes, those at the top producing somewhat inferior, and those at the foot and in the plain ordinary growths. Practically all the best vineyards (which are grown on flat terraces on the slopes, and not on the slopes themselves) face south-west and so get the full benefit of the sun's rays. The most important vineyard in fact on the slopes of the Côte d'Or practically the only vineyard is the Pinoeau or Noiron, but in the plain and in the districts of Mâcon and Beaujolais the Gamay is much cultivated. The influence of the soil on one and the same vine is interestingly illustrated by the different character of the wines grown in those districts, the Beaujolais wines having far greater distinction than those of Mâcon. The commune of Beaune must be regarded as the centre of the Burgundy district, and possesses numerous vineyards of the highest class. To the north of Beaune lie the famous vineyards of Chambertin, Clos Vougeot, Romanée, Richebourg, Nuits St Georges and Corton; to the south those of Pommard, Volnay, Montlêché and Meursault with its famous white wines. The vinification of the Burgundy wines takes place in caves of 500 to 2000 gallons capacity, and it has for very many years been the common practice in vintages in which the must is deficient in saccharine to ensure the stability of the wine by the addition of some sugar in the case. The first rackings generally take place in February or March, and about the second July. The practice of sugaring has ensured greater stability and keeping power to the wines, which formerly were frequently irregular in character and difficult to preserve.

There is no official classification of the Burgundy wines, but the following is a list comprising some of the finest growths in geographical order, from north to south, together with the localities in or near which they are situated.

WINE

An interesting feature of the Côte d’Or is the Hospice de Beaune, a celebrated charitable institution and hospital, the revenues of which are derived from vineyards in Beaune, Corton, Volnay and Pommard. The wines of these vineyards are sold every year by auction early in November, and the prices they may realise are a measure of the quality of the vintage in those and other parts of France.

To the south of Lyons, in the department of the Drôme, are made in the district of Valence the celebrated Hermitage red and white wines. The quality of some of these, particularly of the red, is of such a high order that claret, so-called, is regularly produced in very small quantities. The red wines made at the present time are after the style of Burgundy and possess good keeping qualities.

We except the wines of Midi. In the vine region of that name, in the extreme south of France, the principal principalities are, of course, in France, the count of Barcelona, and the Counts of Provence and Aragon, and it is in these districts that the great viticultural region of France is known as the Midi, comprising the four departments of the Herault, Aude, Gard, and the Pyrenées-Orientales. Thus in 1901 the department of the Herault alone produced nearly 300 million gallons of wine, or approximately a quarter of the whole output of France. The average amount of wine made in the four departments for the past three years has been roughly 300 million gallons. These wines formerly were largely exported as vin de cagaison to South America, the United States, Australia, &c., and were also much employed for local consumption in other parts of France. Owing, however, to the fact that viticulture is now maintained in Australia and particularly in Algeria, and also to the fact that the quality of these Midi wines has fallen off considerably since the phylloxera period, the outlet for them has become much reduced. The Midi wines are for the most part light wines, made by boiling wine down until it attains the consistency of a liqueur. The great bulk of sherry shipped to the United Kingdom is blended. The system of blending sherry in some respects recalls that of the famous “blended whiskies,” which are stored in vats or soleras, and the contents of the soleras are kept as far as possible up to a particular style of colour, flavour and sweetness. Prior to shipment the wines of various soleras are blended according to the nature of the article required.

In addition to the wines described above, there are others of a similar nature grown in the vicinity, such as moscatell (made in Cordova) and muscat (produced on the right bank of the Guadalquivir). The bulk of the sherry imported into the United Kingdom still consists of the heavier, fortified wines, varying in strength from 17 to 21 per cent of absolute alcohol, although the fiscal change introduced in 1886, whereby wines not exceeding 16° proof (less than 21° alcohol) were admitted at a duty of 1s. 3d. as against 3s. for heavier wines, naturally tended to promote the shipment of the lighter dry wines. This edition has been very much assisted by the importation of sherry into the United Kingdom on a considerable scale commenced in the 19th century, and that the wine shipped at that time was of the dry variety. It seems possible that sherry was the first wine known as such in this country, but it is at least doubtful whether this word is, as some contend, derived from seck or sec, i.e. dry. According to Morewood it is more likely to have come from the Japanese sake or sake (see Sake), derived in its turn from the Chinese tsai, the name of the vine.

Chemically the sweet sherry differs from the natural dry light wines in that it contains relatively high proportions of alcohol, saccharine, sugar and small quantities of acid and glicerine. This is well illustrated by the following analysis:

Malaga is a sweet wine produced in the province of that name which is little known in England, but enjoys considerable favour on the Continent. It is made from vino dulce and vino seco, together with varying quantities of vino maestro, vino tierno, arpe and color. The vino maestro must contain at least 12° proof of alcohol, the vino tierno 14°, the arpe 18°, and the color 20° of alcohol, all being blended into a rectangular vessel termed the jarre, the juice, which is so obtained together with that which results from the pressing of the murk, is put into vessels or jars made of paper and roughly modeled from above by about 17 per cent of alcohol. The vino tierno is made by mashing raisins (6 parts) with water (2 parts) pressing, and then adding alcohol, and may be a rule from the Vinci, and to be sold as vino dulce to one-third, and color by concentrating the arpe over a naked fire. Malaga is therefore an interesting example of a composite wine. Besides the sweet variety, a coarse dry wine is also produced.

Another well-known wine district in the south of Spain is that of Rota, where a sweet red wine, known in England as lent (tinto), chiefly used for ecclesiastical purposes, is produced.

Wines of the Central and North.—While the most important Spanish wines are those grown in the southern province of Andalusia, the
WINE

The central and northern districts also produce wine in considerable quantity, and much of this is of very fair quality. Thus in the central district of Val de Peñas and in the Rioja region (situated between Logroño and Logroño—known as the north-east coast of Spain) and the red wines which in regard to vigour, body, and in some other respects resemble the heavier clarets or burgundies of France—although not possessing the delicacy and elegance of the latter. They are shipped in considerable quantities to the United Kingdom and also to Spanish "burgundy." The most important industry, outside the southern districts, is, however, in Catalonia, where, in the neighbourhood of Tarragona, the wines are ... the capital, as "port" is produced. The finest Tarragona wine (from much resembles port) is made in the Priorato region, about 15 m. inland.

Wines of Portugal

In the north-east of Portugal, far from the town of Oporto—from which it takes its name and whence it is exported—it is produced in vineyards, unique in its full-bodied and generous character, known as port.

Port is grown in the Alto Douro district, a rugged tract of land some 30 to 40 m. long by 10 m. wide, which commences at the river Douro some 60 m. above Oporto. The characteristics of the Alto Douro are extremely mountainous and rugged. J. L. W. Thudichum, in his Treatise on Wines, gives a striking and almost poetical description of it as compared with Jerez. He says: "The vineyards of Jerez are so beautiful and peculiar ... From the Alto Douro Undulating hills, easily accessible from all sides, are covered with a luxurious growth of vines. ... Very different is the aspect of the Alto Douro—maize, sorge, anemone, inaccessible mountain, precipice and torrent, while over growing all these rough nature are drawn countless lines of stone walls which man makes or supports the soil in which the vines find their subsistence. ... I thought that, where, for instance, if Jerez was the vineyard of Venus, this Alto vineyard must be termed the vineyard of Hercules." The vineyards, are, in fact, situated on artificially made terraces, supported by walls on the mountain sides. If this were not the case the Alto Douro would not have been planted. The way the Alto Douro is variable. Intense heat in summer is followed by severe cold in winter. The soil is a peculiar clay-schist, on or above granite, with indurated horizons, and it is made of a peculiar clay and soil that port owes its remarkable qualities of colour, body and high flavour. There appears to be no predominant and distinct type of vine, such as is the case in other viticultural districts, but a number of varieties, mostly yielding grapes of a medium size that are common to the Douro vineyards. The method of cultivation is generally that of a rational low culture, and in this respect differs from that employed in other parts of the country, where the vines are either trained on trellis or over trellis-work at some height from the ground.

Vinification.—The process of converting the Alto Douro grapes into wine is different from that employed elsewhere. The grapes are cut and then conveyed in baskets by the Gallegos (as the labourers who come specially from Galicia in Spain for this purpose are termed) to the winery. Here the stalks are removed by means of a machine called the French fork, and the grapes then placed in the lagar. This is a stone vessel of considerable size made to hold up to fifteen pipes (the pipe equals 60 litres). It is placed in a dry room and its depth is 10 to 15 yds. wide. The grapes are first trodden for a period varying from twenty-four hours upwards, and are then allowed to ferment in the lagar itself. When the fermentation has reached a certain point it is generally the custom to again trod the must in order to extract as much colour as possible from the skins. In order to preserve the sweet quality of the wine, fermentation is not permitted to continue beyond this point. When this is reached the wine is drawn from the lagar over a strainer or some similar arrangement into vats yielding from five to thirty pipes. The murk remaining in the lagar is then pressed by means of a lever or beam press with which the village of Núñez is equipped. In order to support the fermenting further and so becoming dry, from 4 to 5 volumes of brandy are added to every 100 volumes of wine in the vats. The alcohol employed for this purpose is as a rule of high quality and made solely from wine. When, after the approach of the cool weather, the fees have dropped, the wines are racked and a further addition of brandy is made. The second racking takes place in March or April, when the wines are placed in pipes and sent in the wind. If it is stored in large over-ground buildings termed lodges. Further addition of brandy is generally added before shipment. The great bulk of the pipe is shipped for many years before shipping, but this does not apply to the commoner varieties, or to the finest wines, which, being the produce of a specific year, are shipped unblended and as a vintage wine. The most famous vintages of recent times were 1847, 1851, 1856, 1861, 1875, 1876, 1877, 1880, 1883, and 1887. A white port is also made in the Alto Douro, and this, although little known in England, is exported in considerable quantities to Germany and Russia. The white port is grown in vineyards which are not quite so favoured as regards position as the red port growths. White port is made from white grapes, and a peculiarity of its manufacture is that the must is frequently fermented in the presence of the skins, which is most unusual in the case of white wines. This gives a certain stringency to white port, which is characteristic of its class.

Distillate.—The Alto Douro has from time to time been sadly ravaged by the oidium and phylloxera. The former first made its appearance in the Alto Douro of the 19th century, and, reached a climax in 1856, when only about 15,000 pipes, that is, about onefifth of the usual quantity, was vintaged. In consequence of this, the exportation of port dropped from over 40,000 pipes in 1856 to about 16,000 pipes in 1858. Since then oidium has reappeared from time to time, but the remedy of spraying with finely divided sulphur, which was discovered at the time of the epidemic, has enabled the wine farmers to keep it under. The phylloxera, which appeared in Alto Douro in about 1868, also ravaged the vineyards. At one time reduced the yield to about one-half of the normal. At one time the position appeared to be desperate, particularly in view of the fact that the farmers refused to believe that the trouble was due to anything other than the continuous drought of successive dry seasons, but at the present time, after much expenditure of energy and capital, the condition of affairs is once more fairly satisfactory.

Port Wine Trade.—The port wine trade is of considerable importance to the United Kingdom not only because the chief trade in this wine is carried on with that country, but also because a very large proportion of the capital invested in the industry is British. It is probable that the English capital locked up in the port industry amounts to some 2 millions sterling. In the period preceding the seventies of the last century, when the prosperity of the whole of the wine exported from Oporto came to Great Britain. Thus in the year 1864 were exported to Great Britain 29,642 pipes and to the rest of the world 507 pipes. The trade with the rest of the world, however, has gradually grown since then, the figures being as follows:

The growth of the export trade from Oporto with the rest of the world is principally due to the enormous increase in the quantity of wine sent to South America, chiefly Brazil, but only a small proportion of this (probably one-eighth) is port wine proper. The bulk of it consists of wines from the Minho and Beira districts. These facts and others are shown in the table of Imports from Oporto which are much more than the total production of wine in the Alto Douro. At the present time the average production of the Alto Douro is about 50,000 pipes. During the last decade it was at a maximum of 67,000 in 1888. The quantity of white wine sent from Oporto, when only 16,000 pipes were obtained. The value of the port taken by the United Kingdom was in the year 1906 over one million sterling, and is also accounted for by a large amount of port, which is commonly known in the United Kingdom as Bueelas Hock.

As far as the United Kingdom is concerned, the Madeira wine imported with that the middle in the 19th century the vineyards by and is still chiefly in the hands of British merchants.

Madeira.

The shipments to the United Kingdom, however, which reached a maximum in 1820, when over half a million gallons were shipped, has fallen off to one-tenth of that amount, and the consumption in these islands was barely 20,000 gallons in 1906. This falling away in the taste for Madeira is partly ascribable to fashion and partly to the fact that the wine has been long since superseded by the port. The re-establishment of the vineyards and the consequent development of the industry did not, however, lead to a renewal of the trade on the former scale with this country. The output in 1906 amounted to 10,000 pipes (Madeira)
GERMANY: ITALY

WINE

Although the quantity of wine produced in Germany is comparatively small and subject to great variations, the quality of the finer wines is, in successful years, of a very high order. In fact Germany is the only country which produces natural (i.e. unfortified) wines of so high a class as to be comparable with—although of an entirely different character from—the wines of France. The finer wines possess great breed and distinction, coupled with a very fine and pronounced bouquet, and in addition have a very marked and rare quality of stability. The great inequalities observed in the different vintage and the exceptionally fine character of the wines in good years are, generally, due to the same cause, namely, to the geographical position of the vineyards. The wines of the Rhine are grown in the most northerly latitude at which viticulture is successful in Europe, and consequently, when the seasons are not too unpropitious, they display the hardness and distinct characteristics of northern products. During the period 1891-1905 the total production of Germany has averaged round 60,000,000 gallons, containing a maximum of 111 million gallons in 1896 and a minimum of 87 million gallons in 1894. The trade with the United Kingdom is now a very considerable one, amounting in 1906 to roughly 1½ million gallons to the value of three-quarters of a million sterling.

The wines grown in the Rheingau, Rheinhessen and in parts of the Palatinate are generally known by the name of Rhine wines, although many of these are actually produced on tributaries of the Rhine, such as the Neckar, Mosel, etc., which the curious generic term "hock" employed in England for Rhine wines is derived, is made in the vicinity of the little village of that name situated on the Main, a number of miles above the city. The latter vineyards consist of an elevated strip along the northerm bank of the Rhine from Bingen on the west to Mainz on the east. The most important vineyards of the Rhine are those of the Mosel, Rheinhessen, and Rheingau, of which the first two mentioned have a characteristic quality of their own.

The vineyards of the Mosel are the earliest to be planted, the hands of the prince of Orange, but after the battle of Jena, Napoleon deprived him of it and presented it to Marshal Kellermann. On the fall of Napoleon, the emperor of Austria took possession of the vineyard and gave it to Prince Metternich. At the present time the property still belongs to the descendants of the latter. The vineyards of Steinberg belong to the state of Prussia. The vineyards of the Mosel are situated in the state of Rhineland Palatinate, and are formed by the valley of the Mosel, of which several qualities are made in each case, fetch exceedingly high prices. The finest wines are produced in a manner somewhat similar to that employed for making the Sauternes. The grapes are allowed to become over-ripe and are then selected by hand. This process produces the so-called Auslese wines, which frequently fetch as much as 30s. or 40s. a bottle. The other most important wines produced in the Rheingau and its extensions are the Feinherben, those of MarLBrunn, Geisenheim, and especially of Wiltingen, which are produced in the lower part of the Rhine valley near the latter town and have a very marked and high quality of stability. The reason for this is to be sought partly in the unscientific methods of cultivation, and partly, in many districts, in the method of vinification, which consists in the wines being carried for a great extent still on trees or trellis-work, or allowed to grow among the rest of the vegetation in the most casual manner. It must be stated, nevertheless, that of recent years a decided improvement has been set in the Rhine districts to the lively interest which the Italian government has taken in the subject, principally owing to the important export trade to America, Switzerland and other countries. The trade with the United States, which in 1887 amounted to little over 120,000 gallons, has risen to considerably over a million gallons. The exports to the Argentine Republic amount to roughly 2 million gallons, and to Switzerland from 4 to 8 million gallons. The exports to Germany amount to little over a quarter of a million gallons annually, and of a value rather less than £30,000. The total exports of Italy are on the average not far from 40 million gallons. The wines of northern Italy are on the whole of good colour, but somewhat harsh. Among the best-known wines in Piedmont are the Barolos and the wines of Asti, which are made from a species of muscatel grapes. They are of an agreeable flavour, and this especially in the dry variety, and of sparkling wine is manufactured in this district. Among the best-known wines of Lombardy are the Passella wines of Valtolina. In central Italy the best grapes are those of Chianti, especially from the Commune of Greve. This commune produces the greater part of these wines, which are of good but not excessive alcoholic strength, containing as a rule some 10½ to 11½ per cent. Some of the Montepulciano wines have a strong characteristic flavour, which is Pitti, and a great deal of acidity, which is Chianti. The best Italian wines, however, are

Practically all the important wines of Germany are white, although there are a few red growths of some quality, for instance Montepulciano and Montefalco, and the black Burgundy wine, the Pinot. In the Rheingau the predominant wine is the Riesling. This plant appears to be indigenous to Germany, and the finest wines are made exclusively from its grapes. In the hope of reproducing the character of the Rhine wines, the Riesling has been planted in many young wine-producing countries, such as Australia, California and the Cape, and not entirely without success. In the Rheingau the vineyards are planted on mountain slopes freely exposed to the sun, and requires a relatively high temperature to reach perfect maturity. In the lower lands, therefore, it is customary to plant, in addition to the Riesling, wines such as Österreicher and the like, which are less subject to evaporation. In this way, the wines, such as the Orchards and the Traminer, are also found in small quantities in the Rheingau. On the Moselle the Riesling and the Kleinberger are the chief growths. The vine on the Rhine is, in order to permit the grapes to acquire the "robe" of the peculiar character of the wine, generally very late, rarely taking place before the end of October. The process of vinification is peculiar in that fermentation takes place in relatively small tanks, the result being that there are frequently marked differences in the produce of the same growth and variety.

The very great variations which are shown by the same growths of grapes are also shown by the addition of sugar to the must, and this is done to improve the wine, which is in many cases not sufficiently sweet to suit the taste of the consumer. In this way the wines are sweetened, and the resultant product is known as Süsswein, or sweet wine. The sweet wines of Germany are of the highest quality, and are made in many different districts, such as the Mosel, the Rhineland, the Haan, the Hesse, and the Saxe.

The wines of the Moselle are of a somewhat different character to those of the Rhine, and are a rule fairly fully bodied and of marked vinosity, the Moselle wines are mostly light and of a somewhat delicate nature. When the wines are generally improve in bottle for a lengthy period, the Moselles are as a rule the best of the whole, and are delivered in a fresh and paratively fresh. Indeed, many connoisseurs hold that when a Moselle ceases to show signs of the somewhat prolonged secondary fermentation the character of the wine begins to change, and the slight film on the palate (caused by the presence of bubbles of carbonic acid gas in the wine), that it has passed its best. The best-known growths of the Moselle are those of Brauneberg, Bernkastel, Piesport and Zell, in the latter of which the celebrated Stein wine, which is grown at the foot of the city of Zell, and in the grand duchy of Baden the celebrated growths of Affental (red), also known as Pfriek, are grown.

The quality of wine is produced in Alsace-Lorraine, Baden and Württemberg, but the majority of these have little interest, inasmuch as they are used only for home consumption. Among the best Ascan wines, which are grown in a valley the name of which is pronounced "Marlen", are the Franconian growths, amongst which the celebrated Stein wine, which is grown at the foot of the town of Würzburg, and in the grand duchy of Baden the celebrated growths of Affenthal (red), also known as Pfriek, are grown.

The wines of France are divided into three general classes: the red wines, the white wines, and the sparkling or champagne wines. The red wines are made from the juice of red grapes, and are generally dark in colour and strong in wine, such as the Burgundy, and the Rhine. The white wines are made from the juice of green grapes, and are generally light in colour and weak in wine, such as the Moselle, and the Rhine. The sparkling or champagne wines are made from the juice of green grapes, and are generally light in colour and weak in wine, such as the Moselle, and the Rhine.
WINE
AUSTRIA: UNITED STATES

Vesuvius from a vine bearing the same name. It has a fine red colour, and unites delicacy and a high bouquet with a sweet elegant taste. The white muscat wines of Vesuvius are also of good quality, and are considered by many to be one of the best known of Italian wines in the United Kingdom is that produced in the neighbourhood of Marsala in the island of Sicily, which bears the name of the wine, and a spiced version which is exported from there in a quite wine which is grown and made with considerable care. It is somewhat similar in character to the wines of Madeira, but its character also recalls some of the sherry types. It is vatted and bottled in the same way as sherry, and is a marvellous trade in this wine with the United Kingdom. In the neighbourhood of Palermo, Muscat and Malvoisie wines of very fair quality are made. The islets of Sardinia and Elba produce considerable quantities of wine, some of which are<br>

Wines of Austria-Hungary

In point of quantity Austria-Hungary takes the fourth place among the wine-producing nations. The average production for the period 1901-1905 was 175 million gallons. Of this quantity Austria is responsible for roughly three-fifths and Hungary for the remaining two-fifths. The character of the Hungarian wine is, however, much higher than that of the Austrian growths. The quality of the bulk of the Austro-Hungarian wines has been improved of late years, principally owing to the endeavours of the respective governments to introduce scientific and modern methods among the wine-farmers. Since the recovery of the Hungarian vineyards from the phylloxera considerable efforts have been made to develop an export trade, and so far very good results are not as yet obtained. Nevertheless, Hungary produces at least one class of wine which may be considered of international importance, namely, the famous Tokay wine, which is produced in the montagnous Hegyalja region in a district which has the town of Tokay for its centre. The vine from which Tokay is made is the Furmint. The finest varieties of Tokay are made entirely or mainly from Furmint grapes which have been selected and allowed to become corrupted by a micro-organism somewhat similar to that obtaining in the Sauternes districts. In the case of Tokay, however, the transformation of the grape into what is popularly a port, is not brought about by the interaction of any particular micro-organism. The sugar is sufficiently powerful to cause the evaporation of the water in the grape through the skin without any preliminary loosening of the latter by the action of the botrytis cinerea, the so-called “sugar-mold” of Tokay is the so-called essence. This is produced by placing the finest grapes in casks and drawing off the juice which exudes naturally as a result of the weight of the material. The Tokay essence is, even after many years, still partially fermentative, and contains about more than 7% to 9% of alcohol. Indeed, it may be said that the main fermentation rarely, if ever, reaches a climax. Another variety of Tokay is the so-called szamorod. This is produced by pressing a mixture of dried grapes and fully ripe grapes and fermenting the must so obtained. It contains up to about 14% of alcohol and relatively little sugar. The most common kind of Tokay is the so-called furminta, from which it is obtained in quantity to supply the must of ordinary grapes. According to the amount of dried grapes (szibele) employed, the wine is termed 1 to 5 “huttig.” The Ausbruch wine takes from three to four years to ripen, and they must not be sold before ten years. Of the many varieties of Tokay, the most famous is the 150 million lire which is sold with much the same manner as has been the case in California. The red wines of Austria, particularly those of South Austria, some of the Mosel wines, and the whites of the Rhine, are well known in the United States and are regarded as their principal characteristics. There are several types of white wines, some resembling French Sauterns and Chablis and others the wines of the Rhine. It has been recognized, however, that it is impossible to actually reproduce the character of the European wines, and it is now generally held to be desirable to recognize the fact that Austrian and Cape wines represent distinct types, and to sell them as such, without any reference to the European parent types from which they have been derived.

Wines of the United States

The cultivation of the vine has made very rapid strides in the United States during the past century. Whereas in 1860 the production recorded was little more than 200 million dollars, the amount to-day is, in good years, not far short of 50 million dollars. The result has been that the domestic wines have now very largely displaced foreign wines. In 1860, for instance, the proportion of wines, and at the same time, there is no reason to believe that the finer European wines will be entirely displaced, inasmuch as these are characterized by qualities of delicacy and breed which cannot be reproduced at will. In 1860, for instance, there is no reason to believe that the wines produced in the United States is of very fair quality, and this is largely due to the fact that the Americans have been at great pains to introduce the latest scientific methods in regard to the vine and wine-making. Thus in parts of California, where high temperatures are liable to prevail during the vintage, the system—first employed in Algeria—of cooling the must during fermentation to the proper temperature by means of a series of pipes in which iced water circulates has produced excellent results. Indeed, the superiority of the wines from many of the most famous European vineyards has also done much towards improving the quality. In California there are, in fact, over 25,000 vineyards, and the production is almost every European wine-growing centre, and the produce of the state is the Riesling, Hermitage, Sauternes, Chianti, &c., in accordance with the district of origin of the vine. California is the largest wine-producing state, and is surpassed only by France in the number of important wine-producing states. The centre of the wine trade of Ohio is at Sandusky on the shores of Lake Erie. Here, as well as at Cleveland, champagne’s and “claret” and sparkling Catawba’s are the chief wines produced. The latter was first made by Nicolas Longworth of Cincinnati. The Catawba is the chief growth of the Lake Erie district; the other important vines being the Delaware and Concord. New York state, in which wine has been grown for a very considerable period, has some thirty vineyards, and the wines, known also as “claret.” There are about 75,000 acres under the vine in this state, and roughly 5 million gallons are produced annually. The Alto Adige in Italy is another important region. It is a wine of sweet character, resembling in general nature the wines of southern Europe (Italy, Spain, Portugal). In the eastern and middle states the wines produced are of a lighter type and of drier flavour, and are grown in small quantities. The most remarkable fact in regard to the wines of the present time America exports a considerable quantity of wine, and there is some trade in the United Kingdom in California “claret.”

Wines of the British Empire

The production of the British Empire is very small, amounting to roughly 30 million gallons. The Cape of Good Hope and in the Australian Commonwealth. At present the average vintage of the Cape and of Australia is in each case roughly 5 to 6 million gallons. In 1905 New South Wales produced 280,000 gallons, Queensland 75,000 gallons, and the others 280,000 gallons respectively. The trade of Australia with the United Kingdom is now considerable, having increased from 168,188 gallons in 1887 to 622,836 gallons in 1906. It is possible that the trade would grow much more rapidly than it has done if it were practicable to ship the lighter varieties of wines. These, which would be suitable for ordinary beverage purposes, cannot as a rule stand the passage through the Red Sea, and it is therefore only possible to ship the heavier or fortified wines. It is doubtful, therefore, whether the products of the British Empire will ever displace European wines in the United Kingdom on a really large scale, for they cannot stand the pressure of sanitary supervision. New South Wales and South Australia are the only important districts, nor, for the reason stated, with the lighter beverage wines. The quality of the wine produced in the Cape and in Australia has improved very much of recent years, chiefly owing to the introduction of new vines and processes. A Wines of North America. In recent years the wine industry has been widely developed, and some of the wines produced are of great importance, and are now, at any rate in point of quality, quite insignificant. At the present time a great part of the industry is devoted to the cultivation of the currant (Vitis cinerea). The average product from 1901 to 1905 is about 280,000,000 gallons.

Other Countries

Considerable quantities of wine are produced in the Balkan states, but the bulk of this is of a coarse description and only fit for local consumption. The average yield of Bulgaria and Rumania is probably not more than 100 million gallons, and Bulgaria alone it is much larger. Thus in 1896 Rumania produced not less than 101 million gallons and Bulgaria 81 million gallons. The wine industry of Greece, which in ancient times was of great importance, has now become, at any rate in point of quality, quite insignificant. At the present time a great part of the industry is devoted to the cultivation of the currant (Vitis cinerea). The average product from 1901 to 1905 is about 280,000,000 gallons. Several countries have now made a small quantity of wine, principally in the Crimea (P.S.)
WINDBRENNER—WINGATE

WINDBRENNER, JOHN (1797-1860), American clergyman, founder of the "Church of God," was born in Glade Valley, Frederick county, Maryland, on the 23rd of March 1797. He studied at Dickinson College, S. W. Schaeffer, in Pennsylvania, and was ordained in the German Reformed Church in 1820 and became a pastor at Harrisburg, Pennsylvania, where his revival preaching and his Revision Hymn Book (1825) brought about a break between his followers and the Reformed Church. In 1830 he founded the Church of God (whose members are commonly called Windabrennerians); he was speaker of its conference and edited its organ, The Church Advocate, until his death in Harrisburg on the 12th of September 1860. He wrote Brief Views of the Church of God (1830); A Treatise on Regeneration (1844); Doctrinal and Practical Sermons (1860); and with I. B. Rupp, The History of all the Religious Denominations in the United States (1844).

The Church of God has three sacraments: baptism (by immersion), feet washing and the Lord's Supper (administered to Christians only, in a sitting posture, and in the evening); it is generally Arminian and pre-millennialist, and in government has local elders and deacons, an annual eldership composed of pastors and lay elders, and, chosen (by and from) the annual eldership, a general eldership with representatives from the denominations in the district. In 1887 number 518 organizations and 24,556 communicants, in the following states: Pennsylvania (11,157), Ohio (2980), Indiana (1999), Illinois (1553), Maryland (1204), Missouri (1853), Iowa, West Virginia, Minnesota, Wisconsin, Nebraska, Michigan, Indiana, Alabama, North Carolina, South Carolina, Kansas, Ohio, Kentucky, West Virginia, Tennessee, North Carolina, South Carolina, Kansas, and Ohio. Under the general eldership are: Findlay College, Findlay, Ohio; Fort Scott College, Fort Scott, Kansas; and an academy at Barkeyville, Pennsylvania. Some of the missionary work is done in Bengal.

WINER, GEORG BENEDIKT (1789-1858), German Protestant theologian, was born at Leipzig on the 13th of April 1789. He studied theology at Leipzig, where eventually (1832) he became professor ordinarius. From 1824 to 1830 he edited with J. G. V. Engelhardt the Neues kritisches Journal der theologischen Literatur, and alone from 1832 to 1837 the Zeitschrift für wissenschaftliche Theologie. He is well known as the author of a Grammatik des neuestenstämmlichen Sprachidioms (1821, 4th ed. revised by P. W. Schmiede, 1894), of which several translations have appeared, the latest being by W. F. Foullon (1879, 3rd ed. 1883). He died on the 12th of May 1858.

His other works include: Komparative Darstellung des Lehrbegriffes der verschiedenen christlichen Kirchenpariêten (1824, 4th ed. by P. Ewald, 1852; Eng. trans., 1873), Biblisches Realwörterbuch (1820; 3rd ed. 1885) and other Bohemian books (1835-1837); Grammatik der altsächsischen und talmudischen Chaldaischen (1824; 3rd ed. by B. Fischer, Chaldische Grammatik für Bibel und Talmud, 2 Bot., 1838), and a useful Handbuch der theologischen Literatur (1820; 3rd ed. 1838-1840, 2 vols.; suppl. 1844, 3rd ed. 1849); Geschetnis Dr. G. B. Winer's, in der Beiträge zur sächsischen Kirchengeschichte.

WINE-TABLE, a late 18th-century device for facilitating after-dinner drinking—the cabinetmakers called it a "Gentleman's Social Table." It was always narrow and of semicircular or horseshoe form, and the guests sat round the outer circumference. In the earlier and simpler shapes metal wells for bottles and ice were sunk in the surface of the table; they were fitted with brass lids. In later and more elaborate examples the tables were fitted with a revolving wine-carriage, bottle-holder or tray, working upon a balanced arm which enabled the bottles to be passed to any guest without shaking. The side opposite the guests was often fitted with a network bag. It has been conjectured that this bag was intended to hold biscuits, but it is much more likely that its function was to prevent glasses and bottles which might be upturned from falling to the floor. That the wine-table might be drawn up to the fire in cold weather without inconvenience from the heat it was fitted with curtains hung upon a brass frame and running upon rings. Sometimes the wine-table was accompanied by a circular bottle-supported on a tripod into which the bottles were deeply sunk to preserve them from the heat of the fire. Yet another form was circular with a socket in the centre for the bottle. Wine-tables followed the fashion of other tables and were often inlaid with wood or brass. They are now exceedingly scarce.

WINFIELD, a city and the county-seat of Cowley county, Kansas, U.S.A., in the S. part of the state, on the Walnut river, about 40 m. S.S.E. of Wichita. Pop. (1890) 5184; (1900) 5354, of whom 293 were foreign born and 282 were negroes; (1905) 7845; (1910) 6700. It is served by the Atchison, Topeka & Santa Fe, the Missouri Pacific, and the St. Louis & San Francisco railways, and is connected by electric line with Arkansas City, Kansas. The city is at St. John's Lutheran College (1893), the South-west Kansas College (Methodist Episcopal, opened in 1886), St. Mary's Hospital and Training School (1888), Winfield Hospital (1900), a Lutheran orphan's home and a State School for Feeble-minded Youth. Island Park (50 acres) is the meeting-place of a summer Chautauqua. Winfield is a supply and distributing point for a rich farming country, in which large quantities of wheat and alfalfa are raised. Limestone is quarried near the city, and natural gas is found in the vicinity and piped in from eastern fields for general use in the city. The municipality owns and operates the waterworks and the electric-lighting plant. Winfield was settled in 1870 and incorporated in 1871.

WINGATE, SIR FRANCIS REGINALD (1861— ), British general and administrator in the Sudan, was born at Broadfield, Renfrewshire, on the 25th of June 1861, being the seventh son of Andrew Wingate of Glasgow and Elizabeth, daughter of Richard Turner of Dublin. He was educated at the Royal Military Academy, Woolwich, and became a lieutenant in the Royal Artillery in 1881. He served in India and Aden, 1881-1882, and in the last-named year was in charge of its reorganization by Sir Evelyn Wood, and in the Gordon Relief Expedition of 1884-1885 was A.D.C. and military secretary to Sir Evelyn. For his services he received the brevet rank of major. After holding an appointment in England for a brief period he rejoined the Egyptian army in 1886. He took part in the operations on the Sudan frontier in 1889, including the engagement at Toski and in the further operations in 1891, being present at the capture of Tokar. In 1894 he was governor of Suakin. His principal work was in the Intelligence branch of the Sudan, of which he became director in 1896. He was versed in Arabic, his knowledge of the country, the examination of prisoners, refugees and others from the Sudan, and the study of documents captured from the Dervishes enabled him to publish in 1891 Mudhish and the Egyptian Sudan, an authoritative account of the rise of the Mahdi and of subsequent events in the Sudan up to that date. Largely through his instrumentality Father Ohrwalder and two nuns escaped from Omdurman in 1891. Wingate also made the arrangements which led to the escape of Slam Pasha in 1895. The English versions of Father Ohrwalder's narrative, with some of Wingate's own, were published in 1892.

Wingate was the author of a work on the topography of Slam's book (Fire and Sword in the Sudan, 1896) which was from Wingate's pen, being a fresh translation of the original German.

As director of military intelligence he served in the campaigns of 1896-1898 which resulted in the reconquest of the Sudan, including the engagement at Firket, the battles of the Atbara and Omdurman and the expedition to Fashoda. In an interval (March-June 1897) he went to Abyssinia as second in command of the Rennell Rodd mission. For his services he was made colonel, an extra A.D.C. to Queen Victoria, received the thanks of parliament and was created K.C.M.G. Wingate was placed in command of an expeditionary force which in November 1899 defeated the remnant of the Dervish host at Om Debretak, Kordufan, the khilifa being among the slain. For this achievement he was made K.C.B. In December of the same year, on Lord Kitchener being summoned to South Africa, Sir Reginald Wingate succeeded him as governor-general of the Sudan and sirdar of the Egyptian army. His administration of the Anglo-Egyptian Sudan was conspicuously successful, the country, after the desolation of the Mahdia, rapidly regaining a measure of prosperity. In 1905 he was raised to the rank of major-general and in 1908 became lieutenant-general. He was also created a pasha and in 1905 received the honorary degree of D.C.L. from Oxford University. In 1909, at the request of the British government, Wingate undertook a special mission to Somaliland to report on the military situation in connexion with the proposed evacuation of the interior of the protectorate.
WINGFIELD, E. M.—WINKELRIED

WINGFIELD, EDWARD MARIA (c. 1560-c. 1614), English colonist in America, was born at Stoneley, Huntingdonshire, about 1560. He served as a soldier both in Ireland and the Low Countries, was one of the patentees of Virginia in 1606, and in 1607 accompanied the first colonists to Jamestown. He was elected president of the Council (15th May 1607), but his arbitrary manners, the fact that he was a Roman Catholic, and the suspicion that he was friendly toward Spain led to his deposition in September. He returned to England in April 1608, and died after 1613.

His amplified diary, entitled "A Discourse of Virginia," was published in *Archaeologia Americana*, vol. iv. (Worcester, 1860), with introduction and notes by Charles Deane.

WINGFIELD, SIR RICHARD (c. 1496-1525), English diplomatist, was one of the twelve or thirteen sons of Sir John Wingfield (d. 1481) of Letheringham, Suffolk. He became a courtier during the reign of Henry VII. and was made a knight of Calais in 1511. With Sir Edward Poyning and others he was sent in 1512 to arrange a holy league between the pope, the English king and other sovereigns, and in 1514 he went to the Netherlands to try and arrange a marriage between the archduke Charles, afterwards the emperor Charles V., and Henry VIII.'s daughter Mary. In the intervals between these and similar errands Wingfield was occupied in discharging his duties at Calais, but in 1516 he resigned his post there and returned to England. In 1520 Sir Richard was appointed ambassador to the French court, and the following year he arranged the marriage of the king's sister, Mary, to Henry VIII. and Francé 1. at the Field of the Cloth of Gold. Twice during 1521 he visited Charles V., his object being to deter him from making war on France, and he was on an errand to Spain when he died at Toledo on the 22nd of July 1525. In 1524 he had been made chancellor of the duchy of Lancaster. For his services Wingfield received lands in various parts of England, including Kimbolton in Huntingdonshire, where he enlarged the castle.

Sir Richard had two brothers who attained some celebrity: Sir Robert (c. 1464-1539), a diplomatist, and Sir Humphrey (d. 1545), speaker of the House of Commons from 1533 to 1538. An elder brother, Sir John, sheriff of Norfolk and Suffolk in 1483, had a son Sir Anthony (c. 1458-1552), who was present at the Field of the Cloth of Gold, and became a member of the privy council and captain of the guard. One of his godsons, Anthony Wingfield (c. 1550-c. 1615), was public orator in the university of Cambridge, and another was Sir John Wingfield (d. 1596), a soldier who was governor of Gertruydenberg from 1587 and 1589. Another of Sir Anthony's descendants, Sir Anthony Wingfield (d. 1638), was created a baronet in 1627. Another brother of Sir Richard, Ludovic, had a son, Sir Richard Wingfield of Pembroke, who was governor of Portsmouth under Queen Elizabeth. He was the father of another Sir Richard Wingfield (d. 1634), who served in Ireland and was created Viscount Powerscourt in 1618. He died without issue, and his Irish estates passed to a cousin, Sir Edward Wingfield (d. 1638), whose grandson, Folliott Wingfield (d. 1717), was created Viscount Powerscourt in 1665, but the title again became extinct when he died. In 1744 his cousin, Richard Wingfield (1667-1751), was created Viscount Powerscourt, and his descendants have held this title until the present day. Sir Mervyn Wingfield (1856-1906), the 9th Viscount, created a peer of the United Kingdom as Baron Powerscourt in 1885.

1. Evidence of Chronicles.—The earliest known mention of the incident is found in a Zürich chronicle (discovered in 1862 by G. von Wyss), which is a copy, made in 1476, of a chronicle written before 1237, though it is wanting in the 16th-century transcript of another chronicler written in 1466, which up to 1389 closely agrees with the former. It appears in the well-known form, but there is no certainty that the anonymous chronicler discovered the Eidenhozen, no name being given, and it seems clear that his death did not take place at that time. No other mention has been found in any of the numerous Swiss or Austrian chronicles till we come to the book De Helvetiae origine, written in 1362 by Rudolph Gwalther (Zwingli's son-in-law), where the hero is described as "a man of Unterwalden, of the Wingelfield family," this being expanded in the final recession of the chronicle (1476) into "he was sent of Unterwalden as a brave knight," while he is entered (in the same book, on the authority of the "Anniversary Book" of Stans, now lost) on the list of those who fell at Sempach at the head of the Nidwalden (or Stans) men as "a knight of von Winkelried, Ritter," this being in the first draft "Arnold Winckelriet."
WINNIPEG

Winkelried and his deed. This is a long ballad of 67 four-line stanzas, part of which (including the Winkelried section) is found in the additions made between 1531 and 1545 to Etterlin’s chronicle by H. H. Burkli. This is the version of Winkelried, written 1532. It is agreed on all sides that the last stanza, attributing the authorship to Halbsuter of Lucerne, “as he came back from the battle,” is a very late addition. Many authorities regard it as mere nonsense that would have been written after the battle of Winkelried, possibly put together by the younger Halbsuter (citizen of Lucerne in 1435, died between 1470 and 1480), though others consider it as an ancient manuscript, perhaps having been composed after the Reformation began, that is, about 1520 or 1530. Some recent discoveries have proved that certain statements in the song usually regarded as anachronisms are quite authentic, and are corroborated by the Old Swiss chronicle of Stolzinger, which may possibly be meant for Winkelried; while in that of Diebold Schilling of Lucerne (1511), though in the text no allusion is made to Halbsuter, the latter does describe the various uniforms then worn, which has accomplished Winkelried’s feat, but he is dressed in the colours of Lucerne. Then there is an engraving in Stumpf’s chronicle (1548), and, finally, the celebrated one by Hans Rudolf Manuel (1551), which has been preserved in the city of Lucerne.

The story seems to have been first questioned about 1850 by Moritz von Sturler of Bern, but the public discussion of the subject occurred in 1862, which was the anniversary of the battle of Stempach. The 讳 Schweizer B"undde, which he delivered in Vienna on March 21, 1860. This began the lively paper war humorously called "the second war of Stempach," in which the Swiss (with but rare exceptions) maintained the historical character of the feat against various foreigners —Austrians and others.

Most of the arguments against the genuineness of the story have been directly indicated: (1) There is the total silence of all the old Swiss chronicles as to the presence of a knight or of a warrior with the solitary exception of the Zürich chronicle of 1476 (and this while they nearly all describe the battle in more or less detail). The tale, as told in the 1476 chronicle, is clearly an interpolation, for it comes immediately after a distinct statement that "God had helped the Confederates, and that with great labour they had defeated the knights and Duke Leopold," while the passage immediately following joins the story of other events and tells us partly out the whole of the "true man," who is not even called Winkelried. (2) The date of the battle is extremely uncertain, but cannot be placed earlier than a few days before 1385. The battle took place 21 April 1386, but its claims to be regarded as embodying an oral contemporary tradition are of the slightest. (3) Similar feats have been frequently recorded, but in each case they are supported by authentic evidence which is lacking in this instance: the capture of the count of Hapsburg, in a skirmish with the Bernese in 1271; Stürlinger of Ratisbon (Regensburg) in 1322, in the war of the count of Kyburg against the men of Bern and Solothurn; Conrad Roy of Lucerne, at Nantey in 1477; Henri Wolleben, at Frastanz in 1490, in the course of the Swabian War; and a man at the battle of Kappel in 1531. (1) It is argued that the course of the battle was such that there was little or no chance of such an act being performed, or if, performed, of having turned the day. This argument rests on the careful critical narrative of the fight constructed by Herr Kleissner and Herr Hartmann from the contemporary accounts which have come down to our time. The first, at least, of these, the work of Philip of the heat of the July sun, the panic which befell a sudden part of the Austrian army, added to the valour of the Swiss, fully explain the event. (2) It is said that the knights (on foot) had been ranked in serried ranks, there must have been sufficient space left between them to allow them to move their arms, and therefore that no man, however gigantic he might have been, could have seized hold of more than half a dozen spears at once. Herr K. Bürkli (Der wahre Winkelried, die Tabak der alten Urschweizer, Zürich, 1886) has put forth a theory of the battle which allows, opposed to all modern accounts, but entirely agrees, he says, with the contemporary accounts. According to this the fight was not a pitched battle but a surprise, the Austrians not having had time to form up into ranks. Assuming this, and putting down the event, the case that these latter men, without preparation and full of mistakes, and that of the song as not proved to have been in existence before 1531, Herr Bürkli comes to the startling conclusion that the phalanx formation of the Austrians, as well as the natural act of Winkelried, have been transferred to Sempach from the fight of Biocca, near Milan (April 27, 1522), where a real leader of the Swiss mercenaries in the pay of France, Arnold Winkelried, really met his death in very much the way that his namesake perished according to the story. Herr Bürkli confines his criticism to the first struggle, in which alone mention is made of the driving back of the Fötsch, pointing out also that the chronicle of 1476 and other later accounts attribute to the Austrians the manner of attack and the long spears which were the special characteristics of Swiss warriors, and that if Winkelried were a knight (as is asserted by Etterlin), he would have been clad in the defence of the field, or at least had a breastplate, neither of which could have been pierced by hostile lances.

However, this may be thought of this daring theory, it seems clear that, while there is some doubt as to whether such an act as Winkelried’s was possible at Sempach, taking into account the known details of the battle, there can be none as to the utter lack of any supporting evidence for the charge of having performed that act in that battle. It is quite conceivable that such evidence may later come to light; for the present it is wanting.

Authorities.—See in particular Theodor von Liebenau’s Die Schlacht bei Sempach—Gedenckbuch zur fünften Säcularfeier (1862), published at the expense of the government of Lucerne. This contains every mention or description of the battle or of anything relating to it, published or unpublished, in prose or in verse, composed within 300 years after the battle, and is a most marvellous and invaluable collection of original materials, in which all the evidence for Winkelried’s deed has been brought together in a handy form.

In this case, the whole work of a Swiss town, and the history of Winkelried by W. Oechslin in vol. iii. of the Allgemeine Biographie, the following are the most noteworthy publications relating to this controversy. In support of Winkelried’s act: G. v. Ochsenen, Die Schlacht bei Sempach (Bern, 1862); A. Duguet, "La Question de Winkelried," in the Muster Neuchtels (Basel, 1866); W. Oechsl, Zur Sempacher Schlachtfeier (Zürich, 1886); E. Seletzan, Sempach of Winkelried (Lausanne, 1886); and the summary in K. Dindllicht’s Geschichte der Schweiz, i. 550–559 (3rd ed., Zürich, 1893). Against Winkelried’s claims we have the remarkable study of O. Kleissner, Die Quellen zur Sempacher Schlacht und die Winkelriedsage (Göttingen, 1873), O. Hartmann, Die Schlacht bei Sempach (Fribourg, 1886); and the conciseness of summary of the evidence given by M. v. Stürler (the first to suspect the story) in the Anzeiger für Schweiz. Geschichte (1881), 392–393.

WINNIPEG, the capital of Manitoba, and chief city of Western Canada. It is situated at the junction of the Assiniboine and Red rivers in the middle of a wide plain. The river valley, being of exceptional richness, early attracted the traders, and so in the beginning of the 19th century gained the attention of Lord Selkirk, a benevolent Scottish nobleman who sent out in 1811–1815 several hundreds of Highland settlers. On the site at the junction of the two rivers where Verandrey, the first white explorer to visit the Red river, had three-quarters of a century before this made his first landing, Fort Rouge, and where some ten years earlier in the century the "No-Thief." Fort was built by Governor Sitkirk with the aid of Fort Gibraltar, the Hudson’s Bay Company, which at the time Lord Selkirk and his friends controlled, erected Fort Douglas, bearing the family name of the colonizer. After bloodshed between the rival fur companies, and their union in 1821, Fort Garry was erected, as a trading post and settlers’ depot, and with somewhat elaborate structure, with stone walls, bastions and portholes. Fort Garry (2) was erected at a considerable cost in 1835. A short distance north of this fort, about the year 1860, the first house on the plain was erected, and to the hamlet rising there was the name Portage (Cree, Wis, murky, nipit, water). The name referred to the outlet between its water and that of the transparent lakes to the east. For ten years the hamlet grew—though very slowly, it being more than four hundred miles from St Paul, the nearest town in Minnesota, to the south. The fur-traders did not seek to increase its size. When the transfer of Ruperts’s Land took place to Canada in 1870, the governor of Assiniboia had his residence at Fort Garry, and here was the centre of government for the settlers over the area surrounding Fort Garry. Its acquisition by Canada and the influx of settlers from Eastern Canada led to the growth of the new town, which was thus named in 1874.
WINNIPEG—WINONA

free lands in all directions by Canadian settlers, all tended to build up the hamlet of Winnipeg into a considerable town. The following figures of population show the remarkable increase of Winnipeg: (1879) 215; (1874) 1860; (1885) 19,574; (1886) 39,384; (1901) 43,450; (1905) 75,972; (1906) 90,153; (1907) 100,000 (estimated). The rapid growth of the city, the character of the soil, and the high prices of material for street construction have led to a large and expensive civic organization. The city is governed by a mayor, four controllers, and twelve aldermen. The city possesses the public utility of water, but the city street car system, gas, and private electric lighting are in the hands of a private company. The city has decided to introduce electric power from Winnipeg river, at a point some 50 m. distant. The streets are in some cases macadamized and in other cases block paved, and in still others asphalted. The Parks Board is a board appointed by the city council, and has the complete administration of a fixed percentage of the city taxes. The streets were boulevarded, trees planted on them, and both of these kept by the Parks Board. A number of well-kept small parks are found throughout the city, and a large park—the Assiniboine—is being prepared and beautified. The greatest business street is Main Street, on which (north) the Great Canadian Pacific railway station and Royal Alexandra Hotel are situated, and (south) the Union station of the Canadian Northern and Grand Trunk Pacific railways are found. On or near this street (132 ft. wide) are placed the great financial institutions of the city, including eighteen chartered banks, mutual insurance companies, the Bank of Canada, the life insurance companies, and real estate buildings and offices. The departmental stores and offices of the Hudson's Bay Company and its Fort Garry court, which stand on Main Street South, are worthy of that ancient company. The city hall, with park and volunteers' monument, are on the same street, while the lofty Union Bank, McIntyre, and Bon Accord blocks are here wildernesses of offices of every description. The second great street, Portage Avenue, of the same width as Main Street, runs at right angles to Main Street, and is the mercantile street of the city. On this are the post office, Free Press office, Y.M.C.A. building, Aikins Block, T. Eaton & Co.'s enormous departmental shop, and the Ideal Building, which are worthy of note. The wholesale business street of the city is Princess, running parallel to Main Street; and the two most beautiful residential streets are Broadway and Assiniboine Avenues. All parts of the city are reached by the Winnipeg electric street railway, which runs north for 25 m. on the continuation of Main Street to the town of Selkirk, west along Portage Avenue for 12 m. to St. James, Silver Heights, St. Charles and Headingley, and south through Fort Rouge to River Park. At the north of the city are St. John's episcopal church and St. John's Grammar School. In the central part of the city are the parliament building, governor's residence, barracks, law courts, university, Manitoba College and Wesley College buildings. More than eighty churches, many of them of architectural value, are found scattered over the city, while the General Hospital, Women's Home, Children's Home, Children's Aid Shelter and Deaf and Dumb Institute speak of the benevolence of the citizens. One of the most striking features of Winnipeg is seen in the elaborate system of public schools. The buildings are not exceeded for beauty of design or for completeness of finish by any Canadian city and by few American cities.

The geographical position of Winnipeg is unique for the purposes of trade. Like Chicago it stands on the eastern border of the prairies. All western trade in Canada of the vast provinces of Manitoba, Saskatchewan, Alberta and British Columbia, must pass through the narrow belt of 100 m., lying between the international boundary line and Lake Winnipeg. Midway in this belt stands Winnipeg. The trade from the wide extent of three-quarters of a million of square miles of prairie and woodland, which are more populous every year, must flow through a narrow spot at Winnipeg; every railway must pass through Winnipeg. In consequence Winnipeg is already a considerable manufacturing centre. Its lumber and flour mills are its largest industries, but the following are found: aerated waters and breweries, tent makers, baking-powder manufactories, box manufacturers, brick makers, broom, brushes and carriage makers, cement blocks, manufacturing chemists, chocolate and cigar manufacturers, confectionery, copper plate, cornice makers, engine builders, gas fitters, ink manufacturers, jewelry makers, lime makers, milliners, opticians, paint makers, glass makers, photographers, pickle makers, planing mills, pork packers, publishers, pump makers, rubber-stamp makers, sash, door and blind factories, upholsterers, ventilating manufactories, vinegar factories, foundries, wire and fence manufactories. The area of the city is 12,700 acres.

WINNIPEG, a lake and river of Canada. The lake is in Saskatchewan, Manitoba and Keewatin, and is situated between 50° 20' and 53° 50' N. and 96° 20' and 99° 15' W. It covers an area of 8,555 sq. m., is at an altitude of 710 ft. above the sea, is 250 m. long, 25 to 60 m. wide, and contains several large islands, including Reindeer (70 sq. m.) and Big Island (60 sq. m.). It is shallow, being nowhere more than 70 ft. in depth, and is consequence extremely stormy and dangerous. It abounds in fish, its white fish being especially celebrated. Its shores are low and on the south extremely marshy. The principal affluent rivers are: Red river, from the south; Winnipeg, Bloodvein, Berens and Poplar from the east; and the Dauphin and Saskatchewan from the west. It receives the surplus waters of lakes Manitoba and Winnipegosis, and discharges by the river Nelson through Lake St. Mary and the Red river, the Waterhen, a tributary on the south, which discharges into Lake Winnipegosis in 48° 47' N. and 89° 57' W., and flows in a westerly direction under the names of Savanne, Seine, and Rainy rivers to the Lake of the Woods; issuing thence as the Winnipeg, it flows N.W. with an exceedingly tortuous and turbulent course to the lake of the same name. It is navigable from the foot of the Lake of the Woods to the head of Rainy lake—with a short portage at Fort Frances falls—a distance of 208 m. Its principal tributary is English river.

WINNIPEGOSIS, a lake of Manitoba and Saskatchewan, Canada, between 51° 34' and 53° 17' N. and 99° 37' and 101° 06' W. Its greatest length is 122 m.; greatest width 17 m.; shore line 570 m.; and area, exclusive of islands, 2000 sq. m. Its greatest ascertained depth is 38 ft., and mean altitude 828 ft. above the sea. Mossy river from the south, draining Lake Dauphin, Swan, and Red Deer rivers are the only considerable streams that fall into it. It drains by the Waterhen river through Waterhen lake into Lake Manitoba, and thence by the Little Saskatchewan into Lake Winnipeg. It was discovered by the chevalier de la Verendrye in 1739.

WINONA, a city and the county-seat of Winona county, Minnesota, U.S.A., about 95 m. S.E. of St. Paul, on the W. bank of the Mississippi river, here crossed by three steel bridges. Pop. (1880) 10,208; (1890) 18,288; (1900) 19,774, of whom 5000 were foreign-born and 30 negroes; (1910 census) 18,383. There are large German and Polish elements in the population, and German and Polish journals, besides two dailies in English, are published here. Winona is served by the Chicago, Burlington & Quincy, the Chicago Great Western, the Chicago, Milwaukee & St. Paul, the Green Bay & Western, and the Chicago & North Western railways, and by river steamboat lines. It is picturesque and situated on a broad, level terrace, slightly elevated above the river, and surrounded by steep bluffs rising to 400-500 ft. At Winona are the Winona General Hospital (1894), to which is attached a Nurses' Training School; the first State Normal School (opened in 1860), and Winona Seminary (1894) for girls, conducted by the Sisters of Saint Francis. The city has a public library (about 30,000 vols.), with a mural decoration by Kenyon Cox; a Federal building; a Masonic Temple; and several parks; and it owns its own water supply (operated by the Holly system). In 1905 the total value of the factory product was $3,500,256 (30-5% more than in 1900). The site of the city was frequently used as a landing place in the old fur-trading days, but was not permanently settled until about 1853. Winona was first chartered as a city in 1857. A large part of it was destroyed

1 Incorporated in this year as a city.
by fire in 1860. The name Winslow is said to be a six word meaning “first-born daughter.”

**WINSFORD,** an urban district in the Northwich parliamentary division of Cheshire, England, on the river Weaver, 6 m. S. of Northwich, on the London & North-Western railway and the Cheshire lines. Pop. (1901) 10,382. In the town, which is only second to Northwich in this respect, large quantities of salt are raised and conveyed to Liverpool for exportation; being shipped in flats down the Weaver, which has been rendered navigable by an elaborate system of locks. Rock-salt is procured, as well as that obtained from the brine-pools. Boot-building is an important industry in the vicinity. In 1860 more than half a million tons of salt are shipped annually. Owing to the pumping of the brine, large tracts of land have been submerged, and there is thus a constant danger to houses. The iron bridge across the Weaver, which was built in 1856, had to be raised thrice in the following twenty-six years. The town has received much benefit from philanthropists, Sir Joseph Verdin providing a technical school, and Sir John Brunner a guildhall and other buildings.

**WINSWOLD, EDWARD** (1595-1653), one of the founders of the Plymouth colony in America, was born in Drechtwich, Worchester, England, on the 18th of October 1595. In 1617 he was removed to Leiden, united with John Robinson's church there, and in 1620 was one of the “pilgrims” who emigrated to New England on the “Mayflower” and founded the Plymouth colony. His wife, Elizabeth (Barker) Winslow, whom he had married in May 1618 at Leiden, having died soon after their arrival, he married, in May 1621, Mrs Susannah White, the mother of Peregrine White (1620-1704), the first child born in New England. This was the first marriage in the New England colonies. Winslow was delegated by his associates to treat with the Indians in the vicinity and succeeded in winning the friendship of their chief, Massasoit (c. 1580-1661). He was one of the assistants from 1624 to 1647, except in 1633-1634, 1636-1637 and 1644-1645, when he was governor of the colony. He was also, in 1643, one of the commissioners of the United Colonies of New England. On several occasions he was sent to England to look after the interests of Plymouth and Massachusetts Bay, and defend these colonies from the attacks of such men as John Lyford, Thomas Morton (q.v.) and Samuel Gorton (q.v.). He left on his last mission as the agent of Massachusetts Bay, in October 1647. He is entitled, where he had an office under Cromwell, and in 1654 was made a member of the commission appointed to determine the value of certain English ships destroyed by Denmark. In 1655 he was the chief of the three English commissioners whom Cromwell sent on his expedition against the West Indies to advise with its leaders Admiral Venables and Admiral William Penn, but died near Jamaica on the 8th of May 1655, and was buried at sea. Winslow's portrait, the only authentic likeness of any of the “Mayflower” “pilgrims,” is in the gallery of the Pilgrim Society at Plymouth, Mass.

His writings, though fragmentary, are of the greatest value to the history of the Plymouth colony. They include: Good News from New England, a True Relation of Things very Remarkable at the Plantation of Plimouth in New England (1624); Hypocrisie Unmasked; by a True Relation of the Governor and Company of Massachusetts against Samuel Gorton, a Notorious Disturber of the Peace (1646), to which was added a chapter entitled “A Brief Narration of the True Grounds or Cause of the First Plantation of New England”; “New England's Salamander (1647); and The Glorious Progress of the Gospel amongst the Indians in New England (1649). With William Bradford he is also supposed to have prepared a Journal of the Beginning and Proceeding of the English Plantation settled at Plymouth in New England (1620-1641), which is generally known as “Mourt's Relation,” owing to its preface having been signed by G. Mourt.” Some of his writings may be found reprinted in Alexander Young's Chronicles of the Pilgrims (Boston, 1841). See J. B. Moore's Memoir of American Governors (New York, 1846); David P. and Frances K. Holton's Winslow Memorial (New York, 1877) and J. G. Palfrey's History of New England (3 vols., Boston, 1856-58). Also see a paper “Edward Winslow, Governor Edward Winslow, his Place and Part in Plymouth Colony,” in the Annual Report of the American Historical Association for 1895 (Washington, 1896). 

His son, JOSIAH WINSLOW (1629-1686), was educated at Harvard College. He was elected a deputy to the General Court in 1653, was an “assistant” from 1657 to 1673, and governor from June 1673 until his death. From 1658 to 1672 he was one of the commissioners of the United Colonies of New England, and in 1675, during King Philip's War, he was commander-in-chief of the united forces of New England.

**WINSOR, JUSTIN** (1831-1897), American writer and librarian, was born in Boston, Massachusetts, on the 2nd of January 1831. At the age of nineteen he printed a History of Duxbury, Mass., the home of his ancestors. He left Harvard without taking an academic degree to study in Paris and Heidelberg, but not until he had planned an extended memoir of Garrick and his Contemporaries, the manuscript of which, in ten volumes with a mass of notes, is in the library of Harvard University. In 1866 Winsor was appointed a trustee of the Boston public library, and in 1868 its superintendent. In 1877 he became librarian of Harvard University, a position he retained until his death. He greatly popularized the use of both these great collections of books. While at the Boston public library he edited a most useful catalogue of books in history, biography and travel, and compiled the list of a set of special books. In 1876 he began a series of monumental publications. The first was a Bibliography of the Original Quotations from the Works of Shakespeare with Particular Reference to Copies in America. Unfortunately, all except about a hundred copies of this work were destroyed by fire. A small volume entitled The Reader's Handbook of the American Revolution (1879) is the model of a reasonable bibliography. In 1880 he began the editing of the Memorial History of Boston (4 vols., 4to), with the co-operation of seventy writers. He so manipulated the contributions and supplemented them with notes as to give an air of unity to the whole work, and completed it in twenty-three months. He then set to work on a still larger co-operative book, The Narrative and Critical History of America, which was completed (1889) in eight royal octavo volumes. These great tasks had compelled Winsor to make a careful and systematic study of historical problems with the aid of contemporaneous cartography. Among the early results of this study was the Bibliography of Pidgen's Geography (1884), and the Catalogue of the Kohl Collection of Maps relating to America (1886), published in the Harvard Library Bulletins. His vast knowledge took the final form of The Library of Congress (4 vols., 8to, 1886-94), The Frontenac (1894), The Mississippi Basin (1895), and The Westward Movement (1897). Besides great stores of information hitherto accessible only to the specialist, these contain many strong expressions of dissent from currently received views. Winsor served for many years on the Massachusetts Archives Commission. His careful Report on the Maps of the Orinoco-Essequibo Region was prepared at the request of the Venezuela Boundary Commission. He was one of the founders of both the American Library Association and the American Historical Association, and was president of both—of the former for ten years, 1876-1885, and the latter in 1886-1887. He died in Cambridge on the 22nd of October 1897.

**WINSTED,** a borough in the township of Winchester, Litchfield county, Connecticut, U.S.A., on the Mad and Still rivers, in the N.W. part of the state, about 26 m. N.W. of Hartford. Pop. of the township (1890) 6,183; of the borough (1900) 6,854. The church, built of stone is a great eye-catcher. The borough is served by the New York, New Haven & Hartford and the Central New England railways, and by electric railway to Torrington. Among the public institutions are the William L. Gilbert Home for friendless children and the Gilbert free high school, each endowed with more than $600,000 by William L. Gilbert, a prominent citizen; the Beardsley public library (1874), the Convent of Saint Margaret of Cortona, a Franciscan monastery, and the Litchfield County Hospital. In a park in
the central part of the borough there is a tower (60 ft. high) to
the memory of the soldiers of Winsted who fell in the Civil War,
and another park contains a soldiers' monument and a memorial
fountain. Water power is derived from the Mad river and High-
land lake, which is west of the borough and is encircled by the
Wakefield boulevard, a seven-mile drive, along which there are
many summer cottages. The manufactures include cutlery and
dress tools, clocks, silk twist, hosery, leathers &c. Winsted was
settled in 1756 and chartered as a borough in 1838. The name
Winsted was coined from Winchester and Barkhamsted, the
latter being the name of the township immediately east of
Winchester. The township of Winchester was incorporated in
1771.

Winston-Salem, two contiguous cities of Forsyth county,
North Carolina, U.S.A., about 115 m. N.W. of Raleigh. Pop. of
Winston (1880) 2854; (1890) 8018; (1900) 10,005 (5934 negroes);
(1910) 17,167. Pop. of Salem (1880) 2711; (1900) 3642 (488 being
negroes); (1910) 5535. Both cities are served by the Southern,
and the Norfolk & Western railways. Since July 1899, when the
post office in Salem was made a sub-station of that of Winston,
the cities (officially two independent municipalities) have been
known by postal and railway authorities as Winston-Salem.
Winston is the county-seat and a manufacturing centre. Salem
is largely a residential and educational city, with many old-
fashioned dwellings, but there are some important manufactories
here also; it is the seat of the Salem Academy and College
(Moravian) for women, opened as a boarding-school in 1802;
and of the Slater Normal and Industrial School (non-sectarian)
for negroes, founded from the Slater Fund in 1892. The surround-
ing country produces tobacco of a superior quality, and to
the tobacco industry, introduced in 1872, the growth of Winston
is chiefly due; the manufacture of flat plug tobacco here is
especially important. The total value of Winston’s factory
products increased from $4,887,849 in 1900 to $11,532,206 in
1905, or 132.3%.

Salem was founded in 1766 by Friedrich Wilhelm von Marschall
(1721–1802), a friend of Zinzendorf, and the financial manager
of the board controlling the Moravian purchase made in North
Carolina in 1753, consisting of 100,000 acres, and called Wachovia.
The town was to be the centre of this colony, where missionary
work and religious liberty were to be promoted, and it remained
the home of the governing board of the Moravian Church in the
South. In 1849 exclusive Moravian control of Salem’s industries
and trades was abolished; in 1856 land was first sold to others than
Moravians, and in the same year the town was incorporated.
Winston was founded in 1851 as the county-seat and was named in honour of Major Joseph Winston
(1746–1815), a famous Indian fighter, a soldier during the War of
Independence, and a representative in Congress in 1793–1795
and 1803–1807. The growth of the two cities has been rapid
since 1890.

See J. H. Clewell, History of Wachovia in North Carolina (New
York, 1902).

Winter, John Strange, the pen-name of Henrietta
Eliza Vaughan Stannard (1836– ), English novelist, who was
born on the 13th of January 1836, the daughter of Rev. H. V.
Palmer, rector of St Margaret’s, York. She early began to write
novels for different magazines, producing sentimental
stories, chiefly of army life. Two of these, Bouquet’s Baby and
Howpla, which appeared originally in The Graphic in 1885,
established her reputation, and she became a prolific novelist,
producing some sixty other light and amusing books, the best
of which deal with military life. An indefatigable journalist
on matters affecting women, she was the first president of the
Writers’ Club (1892), and presided from 1901 to 1903 over the
Society of Women Journalists. She married in 1884 Arthur
Stannard, a civil engineer.

Winter, Peter (c. 1725–1825), German dramatic composer,
was born at Mannheim about 1725. He received some instruc-
tion from the Abt Vogler, but was practically self-taught.
After playing in the Kapelle of the Elector Karl Theodor, at
Munich, he became in 1776 director of the court theatre. When
Mozart produced his Idomeneo at Munich in 1781, Winter,
annoyed at his success, conceived a violent hatred for him;
yet of more than thirty operas written by Winter between 1778
and 1820 very few were unsuccessful. His most popular work,
Das unterbrochene Opferfest, was produced in 1796 at Vienna,
where in 1797–1798 he composed Die Pyramiden von Babylon
and Das Labyrinth, both written for him by Schikaneder in
addition to the one act opera of Mozart’s Zauberflöte. He returned
to Munich in 1798. Five years later he visited London, where
he produced Calypso in 1803, Prasertina in 1804, and Zobra
in 1805, with great success. His last opera, Sünder und Schneider,
was produced in 1820 at Munich, where he died on the 17th of
October 1825. Besides his dramatic works he composed some
effective sacred music, including twenty-six masses.

Winterfeldt, Hans Karl von (1707–1757), Prussian
general, was born on the 4th of April 1707 at Vanselow in
Pomerania. His education was imperfect, and in later life he
always regretted his want of familiarity with the French language.
He entered the cuirassier regiment of his uncle, Major-General
von Winterfeldt (now the 12th) in 1720, and was promoted
cornet after two years’ service. But he was fortunate enough,
by his stature and soldierly bearing, to attract the notice of
Frederick William I., who transferred him to the so-called great
regiment of grenadiers as a lieutenant. Before long he became
a personal aide-de-camp to the king, and in 1732 he was sent
with a party of selected non-commissioned officers to assist in
the organization of the Russian army. While the guest of
Marshall Münch at St Petersburg, Winterfeldt fell in love with
and married his cousin, Countess Julie von Maltzahn, who was the
King’s stepdaughter and a maid-of-honour to the grand-duchess
Elizabeth. On returning to Prussia he became intimate with the
crown prince, afterwards Frederick the Great, whom he
accompanied in the Rhine campaign of 1734. This intimacy,
in view of his personal relations with the king, made Winter-
feldt’s position very delicate and difficult, for Frederick William
and his son were so far estranged that, as every one knows,
the prince was sent before a court-martial by his father, on the
charge of attempting to desert, and was condemned to death.
Winterfeldt was the prince’s constant friend through all these
troubles, and on Frederick II.’s accession he was promoted
major and appointed aide-de-camp to the new sovereign.

When the first Silesian War broke out Winterfeldt was sent
on a mission to St Petersburg, which, however, failed. He then
commanded a grenadier battalion with great distinction at Moll-
witz, and won further glory in the celebrated minor combat of
Rothschild, where the Prussian Hussars defeated the Austrians
(May 17, 1741). One month from this day Winterfeldt was
made a colonel, as also was Zieten (q.v.), the cavalry leader
who died later on at Vreuzendam. He was subsequently
appointed aide-de-camp to the queen, who was afterwards
the older in years and service, bitterly resented the rapid
promotion of his junior. After this Frederick chiefly employed
Winterfeldt as a confidential staff officer to represent his views
to the generals, a position in which he needed extraordinary
tact and knowledge of men and affairs, and as a matter of course
made many enemies.

In the short peace before the outbreak of the second war he
was constantly in attendance upon the king, who employed him
again, when the war was resumed, in the same capacity as before,
and, after he had been instrumental in winning a series of successful
minor engagements, promoted him (1745) major-general, to date from January 1743.

For his great services at Hohenfriedberg Frederick gave him
the captaincy of Tattiau, which carried with it a salary of 500
thalers a year. At Katholisch-Hennerdorf, where the sudden
and unexpected invasion of the Austro-Saxons was checked by
the vigour of Zieten, Winterfeldt arrived on the field in time to
take a decisive share. Once again the rivals had to share their
lucrative fief, at Raszvatz they broke through the latter, as
the older in years and service, bitterly resented the rapid
promotion of his junior. After this Frederick chiefly employed
Winterfeldt as a confidential staff officer to represent his views
to the generals, a position in which he needed extraordinary
tact and knowledge of men and affairs, and as a matter of course
made many enemies.

the next great war, Winterfeldt was in constant attendance upon the king, except when employed on confidential missions in the provinces or abroad. In 1756 he was made a lieutenant-general and received the Black Eagle.

In this year he was feverishly active in collecting information as to the coalition that was secretly preparing to crush Prussia, and in preparing for the war. He took a leading part in the discussions which eventuated in Frederick's decision to strike the first blow. He was at Parnawa with the king, and advised him against absorbing the Saxon prisoners into his own army. He accompanied Schwerin in the advance on Prague in 1757 and took a conspicuous part in the battle there. After the defeat of Kolin, however, Winterfeldt, whom Frederick seems to have regarded as the only man of character whom he could trust to conduct the more delicate and difficult operations of the retreat, found himself obliged to work in close contact with the king's brother, Prince William, the duke of Brunswick-Bevern, Zieten and others of his enemies. The operations which followed may be summarized by the phrase "everything went wrong"; after an angry scene with his brother, the prince of Prussia retired from the army, and when Frederick gave Winterfeldt renewed marks of his confidence, the general animosity reached its height. As it chanced, however, Winterfeldt felt a victim to his own bravery in the skirmish of Mopps near Görlitz on the 7th of September. His wound, the first serious wound he had ever received, proved fatal and he died on the 8th. The court eminities provoked by his twenty years' unbroken intimacy and influence with the king, and the denigration of less gifted or less fortunate soldiers, followed him beyond death. Prince William expressed the bitterness of his hatred in almost his last words, and Prince Henry's memoirs give a wholly incredible portrait of Winterfeldt's arrogance, dishonesty, immorality and incapacity. Frederick, however, was not apt to encourage incompetence in his most trusted officers, and as for the rest, Winterfeldt stood first amongst the very few to whom the king gave his friendship and his entire confidence. On hearing of Winterfeldt's death he said, "Einen Winterfeld finde ich nie wieder," and a little later, "Er war ein guter Mensch, ein Seelenmensch, er war mein Freund." Winterfeldt was buried at his estate of Barschau, whence, a hundred years later, his body was transferred to the Invaliden Kirchhof at Berlin. A statue was erected to his memory, which stands in the Wilhelmsplatz there, and another forms part of the memorial to Frederick the Great in Unter den Linden.

WINTERGREEN, known botanically as Gaultheria procumbens, a member of the heath family (Ericaceae), is a small creeping, evergreen shrub with numerous short erect branches bearing in the upper part short-stalked oval, thick, smooth shining leaves with sharp-toothed edge. The flowers are borne singly in the leaf axils and are pendulous, with a pale pink waxy-looking urn-shaped corolla. The bright crimson-red sub-globular, berry-like fruit consists of the much-enlarged fleshy calyx which surrounds the small thin-walled many-seeded capsule.

The plant is a native of shady woods on sandy soil, especially in mountainous districts, in southern Canada and the northern United States; it is quite hardy in England. The leaves are sharply astringent and have a peculiar acrid smell and taste due to a volatile oil known as oil of winter green, used in medicine in the treatment of muscular rheumatism (for the therapeutic action see Salicylic Acid). An infusion of the leaves is used, under the name mountain or Salvador tea, in some parts of North America as a substitute for tea; and the fruits are eaten under the name of partridge or deer berries. Other names for the plant are tea-berry, checker-berry, box-berry, jersey tea, spice-berry and ground holly.

See Bentley and Trimen, Medicinal Plants, t. 164.

WINTER S BARK, the bark of Drimys Wintheri, an evergreen tree belonging to the Magnolia family. It was formerly official in Europe, and is still held in esteem in Brazil and other parts of South America as a popular remedy for scurvy and other diseases. The plant is a native of the mountains and highlands from Mexico to the Straits of Magellan.

WINNER, CHRISTIAN (1796-1876), Danish lyrical poet, was born on the 20th of July 1796 at Fensmark, in the province of Praestø, where his father was priest. He went to the university of Copenhagen in 1815, and studied theology, taking his degree in 1824. He began to publish verses in 1810, but no collected volume appeared until 1828. Meanwhile, from 1824 to 1830, Winter was supporting himself as a tutor, and with so much success that in the latter year he was able to go to Italy on his savings. In 1835 a second volume of lyrics appeared, and in 1838 a third. In 1841 King Christian VIII. appointed Winter to travel to Mecklenburg to instruct the princess Caroline, on the occasion of her betrothal to the Crown Prince of Denmark, in the Danish language. Further collections of lyrics appeared in 1842, 1848, 1850, 1853, 1865 and 1872. When he was past seventy the royal line of Winter disappeared, and in 1851 he received a pension from the state as a poet, and for the next quarter of a century he resided mainly in Paris. Besides the nine or ten volumes of lyrical verse mentioned above, Winter published The Stag's Flight, an epical romance in verse (1855); In the Year of Grace, a novel (1874); and other works in prose. He died in Paris on the 30th December of 1876, but the body was brought to Denmark, and was buried in the heart of the woods. In the verse of
Christian Winthrop the scenery of Denmark, its beechwoods, lakes and meadows, its violet-scented dingles, its hollows perfumed by wild strawberries, found such a loving and masterly painter as they are never likely to find again. He is the most spontaneous of lyrists; his little poems are steeped in the dew and light and odour of a cool, sunshiny morning in May. His melodies are artless, but full of variety and delicate harmony. When he was forty-seven he fell in love, and at that mature age startled his admirers by publishing for the first time a cycle of love-songs, many of which were to be expected from a spirit so unfaded; they still stand alone for ten years a simple sweetness of passion. The technical perfection of Winther's verse, in its extreme simplicity, makes him the first song-writer of Denmark.

(Edward G. C.)

WINTHROP, JOHN (1588-1649), a Puritan leader and governor of Massachusetts, was born in Edwardston, Suffolk, on the 12th of January (O.S.) 1588, the son of Adam Winthrop of Groton Manor, and Anne (Browne) Winthrop. In December 1602 he matriculated at Trinity College, Cambridge, but he did not graduate. The years after his brief course at the university were devoted to the practice of law, in which he achieved considerable success, being appointed, about 1623, an attorney in the Court of Wards and Liveries, and also being engaged in the drafting of parliamentary bills. Though his residence was at Groton Manor, much of his time was spent in London. Meanwhile he passed through the deep spiritual experiences characteristic of Puritanism, and made wide acquaintance among the leaders of the Puritan party. On the 26th of August 1629 he joined in the "Cambridge Agreement," by which he and his associates, pledged themselves to remove to New England, provided the government and patent of the Massachusetts colony should be removed thither. On the 20th of October following he was chosen governor of the "Governor and Company of the Massachusetts Bay in New England," and sailed in the "Arbella" in March 1630, reaching Salem (Mass.) on the 12th of June (O.S.), accompanied by a large party of Puritan immigrants. After a brief sojourn in Charlestown, Winthrop and many of his immediate associates settled in Boston in the autumn of 1630. He shared in the formation of a church at Charlestown (afterwards the First Church in Boston) on the 30th of July 1630, of which he was the first member. At Boston he erected a large house, and there he lived till his death on the 26th of March (O.S.) 1649.

Winthrop's history in New England was very largely that of the Massachusetts colony, of which he was twelve times chosen governor by annual election, serving in 1629-1634, 1637-1640, in 1642-1644, and in 1646-1649, and dying in office. To the service of the colony he gave not merely unwearied devotion; but in its interests consumed strength and fortune. His own temper of mind was conservative and somewhat aristocratic, but he guided political development, often under circumstances of great difficulty, with singular fairness and conspicuous magnanimity. In 1634-1635 he was a leader in putting the colony in a state of defence against possible coercion by the English government. He opposed the majority of his fellow-townsmen in the so-called "Antinomian controversy" of 1636-1637, taking a strongly conservative attitude towards the questions in dispute. He was the first president of the Commissioners of the United Colonies of New England, organized in 1643. He defended Massachusetts against threatened parliamentary interference once more in 1645-1646. That the colony successfully weathered its early perils was due more to Winthrop's skill and wisdom than to the services of any other of its citizens.

Winthrop was four times married. His first wife, to whom he was united on the 16th of April 1603, was Mary Fort, daughter of John Fort, of Great Stambridge, Essex. She bore him six children, of whom the eldest was John Winthrop, Jr. (q.v.). She was buried in Groton on the 26th of June 1615. On the 6th of December 1615 he married Thomasine Clpton, daughter of William Clopton of Castelnes, near Groton. She died in childbirth about a year later. He married, on the 29th of April 1618, Margaret Tyndal, daughter of Sir John Tyndal, of Great Mapledest, Essex. She followed him to New England in 1631, bore him eight children, and died on the 14th of June 1647. Late in 1647 or early in 1648 he married Mrs Martha Coytmore, widow of Thomas Coytmore, who survived him, and by whom he had one son.

Winthrop's Journal, an invaluable record of early Massachusetts history, was printed in part in Hartford in 1790; the whole in Boston, printed by James Savage, as The History of New England from 1630 to 1649, in 1825-1826, and again in 1853; and in New York, edited by James K. Hosmer, in 1908. His biography has been written by Robert C. Winthrop, Life and Letters of John Winthrop (2 vols., 1847 ed.); and by Joseph H. Twichell, John Winthrop (New York, 1891). See also Mrs Alice M. Earle, Margaret Winthrop (New York, 1895).

WINTHROP, JOHN (1606-1676), generally known as John Winthrop the Younger, son of the preceding, born at Groton, England, on the 12th of February 1606. He was educated at the Bury St Edmunds grammar school and at Trinity College, Dublin, studied law for a short time after 1634 at the Inner Temple, London, accompanied the ill-fated expedition of the duke of Buckingham for the relief of the Protestants of La Rochelle, and then travelled in Italy and the Levant, returning to England in 1629. In 1631 he followed his father to Massachusetts, and was one of the "assistants" in 1635, 1640 and 1641, and from 1644 to 1649. He was the chief founder of Agawam (now Ipswich), Mass., in 1633, went to England in 1634, and in the following year returned as governor, for one year, of Connecticut, under the Saye and Sele patent, sending out a party which built the fort at Saybrook, at the mouth of the Connecticut river. He then lived for a time in Massachusetts, where he devoted himself to the study of science and attempted to interest the settlers in the development of the colony's mineral resources. He was again in England in 1641-1643, and on his return established iron-works at Lynn and Braintree, Mass. In 1645 he obtained a title to lands in south-eastern Connecticut, and founded there in 1645 what is now New London, whither he removed in 1650. He became one of the magistrates of Connecticut in 1651; in 1657-1658 was governor of the colony; and in 1659 again became governor, being annually re-elected until his death. In 1662 he obtained in England the charter by which the colonies of Connecticut and New Haven were united. Besides being governor of Connecticut, he was also in 1675 one of the commissioners of the United Colonies of New England. While in England he was elected to membership in the newly organized Royal Society, to whose Philosophical Transactions he contributed two papers, "Some Natural Curiosities from New England," and "Description, Culture and Use of Maize." He died on the 5th of April 1676 in Boston, whither he had gone to attend a meeting of the commissioners of the United Colonies of New England.

His correspondence with the Royal Society was published in series 1, vol. xvi. of the Massachusetts Historical Society's Proceedings. See T. F. Water's Sketch of the Life of John Winthrop the Younger (Ipswich, Mass., 1899).

Winthrop's son, FITZ-JOHN WINTHROP (1638-1707), was educated at Harvard, though he did not take a degree; served in the parliamentary army in Scotland under Monk, whom he accompanied on his march to London, and returned to Connecticut in 1663. As major-general he commanded the unsuccessful expedition of the New York and Connecticut forces against Canada in 1690; from 1663 to 1667 he was the agent of Connecticut in London; and from 1668 until his death he was governor of Connecticut.

WINTHROP, ROBERT CHARLES (1809-1840), American orator and statesman, a descendant of Governor John Winthrop (1588-1649), was born in Boston, Massachusetts, on the 12th of May 1809. He graduated at Harvard in 1828, studied law with Daniel Webster and in 1831 was admitted to the bar. He was a member of the Massachusetts House of Representatives in 1834-1840—for the last three years as speaker,—and in 1840 was elected to the national House of Representatives as a Whig, serving from December 1840 to 1850 (with a short intermission, April-December 1842). He soon became prominent and was speaker of the Thirtieth Congress (1847-1849), though his
conservatism on slavery and kindred questions displeased extremists, North and South, who prevented his re-election as speaker of the Thirty-first Congress. On the designation of Daniel Webster to become secretary of state, Winthrop was appointed to the Senate (July 1850), but was defeated in the Massachusetts legislature for the short term on Apr. 30, 1851, and for the long one (April 24, 1851) by a coalition of Democrats and Free Soilers and served only until February 1851. In the same year he received a plurality of the votes cast for governor, but as the constitution required a majority vote, the election was thrown into the legislature, where he was defeated by the same coalition. Thereafter, he was never a candidate for political office. With the breaking up of the Whig party he became an independent and supported Millard Fillmore in 1856, John Bell in 1860, and General G. B. McClellan in 1864. He was president of the Massachusetts Historical Society from 1855 to 1885, and for the last twenty-seven years of his life was president of the Peabody Trust for the advancement of education in the Southern States. Among his noteworthy orations of a patriotic character were those delivered at Boston in 1876, at Yorktown in 1881, and in Washington on the completion of the Washington Monument in 1885. He died in Boston on the 16th of November 1894.

Among his publications were: Addresses and Speeches (Boston, 1852-1862); Letters of John Winthrop (2 vols., Boston, 1864-1867); and Washington, Benedict and Franklin (Boston, 1876). See R. C. Winthrop, Jr., Memoir of R. C. Winthrop (Boston, 1898).

Winthrop—Winzet. A township and a summer resort of Suffolk county, Massachusetts, U.S.A., occupying a peninsula jutting out into Massachusetts Bay about 5 m. N.E. of Boston and 3 m. S.E. of Chelsea, and forming part of the northern-eastern boundary of Boston Harbour. Pop. (1900) 6038, of whom 1487 were foreign-born and 43 were negroes; (1910, U.S. census) 10,132. Between May and October the population is estimated to be between 14,000 and 16,000. Area, 1-64 sq. m. Winthrop is served by the Winthrop branch of the Boston, Revere Beach & Lynn railway, and by electric railway from Orient Heights to Revere, Chelsea, Lynn, by a ferry to Boston East Coast Line. The township contains several villages connected by a railway loop; there are nine stations in its 5-3 m. of track. The peninsula has about 8 m. of water front on the ocean and the harbour. The northern part nearest the narrow neck connecting with the mainland is a high bluff, known as Winthrop Highlands, having its northern-eastern terminus in Grover's Cliff, a bold headland which forms the north-easternmost point of the peninsula. On Grover's Cliff is Fort Heath, a battery of three powerful long-range guns. At the western end of the Highlands is Fort Banks (a part of Boston's harbour defence), consisting of a mass ofighthouse, built in 1854 and 1855, each able to drop a 600 lb shell on a ship 6 m. at sea. From Grover's Cliff a fine sandy beach facing the open ocean leads to Great Head, the highest elevation on the peninsula. Winthrop Shore Drive (16-73 acres), one of the reservations of the Metropolitan park system, is a public parkway along the shore. From Great Head, a long sandy spit curves away southward, ending in Point Shirley, a hilltop and flat sandy plain, separated by Shirley Gut, a narrow channel of deep water, from Deer Island, on which are the Boston House of Correction and City Prison. At Point Shirley is the Point Shirley Club house and anchorage; and at Winthrop Center on the west side are the Town Hall, the High School, the Public Library, the Masonic Hall, College Park Yacht Club and Ingliside Park. There are several large summer hotels.

Winthrop, first known as "Pullen Poynt" (Pulling Point) because the tide made hard pulling here for boatsmen, was originally a part of Boston; it was part of Chelsea from 1739 until 1846, when with Rumney Marsh it was separately incorporated as North Chelsea, from which it was set off as a township in 1852 under the present name, in honor of one William Winthrop, who was a son of Governor John Winthrop, the elder, and whose house is still standing. Point Shirley takes its name from Governor William Shirley who helped to establish a cod fishery there in 1753. Before and after the War of Independence Winthrop was a favourite seaside home for Bostonians, many prominent families, including the Gibbons, Hancock, Bartletts, Emersons, Lotings and Lowells, having country-seats here. The community was a secluded rural retreat until the construction of the railway in 1876 converted it into a watering-place.

See C. W. Hall, Historical Winthrop, 1630-1902 (Boston, 1902).

Winwood, Sir Ralph (c. 1563-1617), English politician, was born at Aynhoe in Northamptonshire and educated at St John's College, Oxford. In 1590 he became secretary to Sir Henry Neville (c. 1564-1615), the English ambassador in France, and he succeeded Neville in this position two years later, retaining it until 1603. In this year Winwood was sent to The Hague as agent to the States-General of the United Provinces, and according to custom he became a member of the Dutch council of state. His hearty dislike of Spain coloured all his actions in Holland; he was anxious to see a continuance of the war between Spain and the United Netherlands, and he expressed both his own views and those of the English government at the time when he wrote, "how convenient this war would be for the good of His Majesty's realms, if it might be maintained without his charge." In June 1608 Winwood signed the league between England and the United Provinces, and he was in Holland when the trouble over the succession to the duchies of Jülich and Cleves threatened to cause a European war. In this matter he negotiated with the Protestant princes of Germany on behalf of James I; he returned to England in 1610 and served as speaker of the House of Commons from March 1614 and a member of parliament. In the House of Commons he defended the king's right to levy impositions, and other events of his secretaryship were the inquiry into the murder of Sir Thomas Overbury and the release of Raleigh in 1616. Raleigh was urged by Winwood to attack the Spanish fleet and the Spanish settlements in South America, and the secretary's share in this undertaking was the subject of complaints on the part of the representatives of Spain. In the midst of this he died in London on the 27th of October 1617. It is very doubtful if he himself had lived till the following summer, he would have shared in Raleigh's ruin." One of Winwood's daughters, Anne (d. 1643), married Edward Montagu, 2nd Baron Montagu of Boughton, and their son was Ralph Montagu, 1st Duke of Montague.

Winwood's official correspondence and other papers passed to the duke of Montague, and are now in the possession of the duke of Sutherland. They are divided and arranged in the Historical Manuscripts Commission on the manuscripts of the duke of Buckingham. See the Introduction to this Report (1899); and also S. R. Gardiner, History of England, vols. ii. and iii. (1904-1907).

Winzet, Ninian (1558-1592), Scottish poetical writer, was born in Renfrew, and was educated at the University of Glasgow. He was ordained priest in 1546, and in 1552 was appointed master of the grammar school of Linlithgow, from which town he was later "expelit and schott out" by the partisans of Dean Patrick Kinloch, "preacher" there. He had also enjoyed the office of Provost of the Collegiate Church of St Michael in that town. He retired to Edinburgh, where the return of Queen Mary had given heart to the Catholics. There he took part in the pamphlet war which then raged, and entered into conflict with Knox and other leading reformers. He appears to have had a great deal of time as occasion served. In July 1562, when engaged in the printing of his Lusiad Blast, he narrowly escaped the vengeance of his opponents, who had by that time gained the upper hand in the capital, and he fled, on the 3rd of September, with the nuncio Gouda to Louvain. He reached Paris in 1565 and became a member of the "German Nation" of the university. At Queen Mary's request he joined Bishop Leslie on his embassy to Queen Elizabeth in 1571, and remained with the bishop after his removal by Elizabeth's order to ward at Fenny Stantoun, Huntingdonshire. When further suspicion fell on Leslie and he was committed to the Tower, Winzet was permitted to return to the university; he continued his studies, and in 1574 left for Douai, where in the following year he became a licentiate. He was in residence at Rome from 1575 to 1577, and was then appointed by Pope
WIRE

Gregory XIII, abbot of the Benedictine monastery of St James, Regensburg. There he died on the 21st of September 1592.

Winzet’s work was almost entirely controversial. He justified his literary activity on the side of Catholicism on the double plea of conscience and the inability of the bishops and theologians to supply the necessary arguments (First Tractate, ed. S.T.S., i. p. 10). "We may reason within our own sphere, as we think, referring our judgment to the Holy Catholic Kirk."

In his first work, Critiae Tractates (three in number), printed in 1562, he narrates his fellow clergy for negligence and sin, issues from Spain, regarding his authority as minister and his share in the new ecclesiastical constitution, and protests against the interference with Catholic churches by the magistrates of Edinburgh. The Last Blast, which was interrupted in publication, is an oration against heretics and a falsely ordained clergy. In his Buke of Four S authorities, and other matters, he is dogmatic, rather than polemical. He translated the Commonitorium of Vincentius Lirinensis (1563), and wrote, in Latin, a Flagellum sectariorum and a Verita in Georgiia Buchanania (1582).

Winzet’s vernacular writings have been edited by J. Houson for the S.T.S. (2 vols., 1888, 1890). The Tractates were printed, with a preface by David Laing, by the Mainland Club (1855). For Winzet’s career see sections Introd., ed. 3rd iii., Mackenzie, Lives, iii., and the Introduction to S.T.S., edit. u.s.

WIRE (A.S. wir, a wire; cf. Swed. vire, to twist, M.H.G. wire, a gold ornament, Lat. virae, armlets, ultimately from the root we, to twist, bind), a thin long rod of metal, generally round in section. The uses of wire are multifarious and diverse beyond all enumeration. It forms the raw material of important manufactures, such as the wire-net industry, wire-cloth making and wire-robe spinning, in which it occupies a place analogous to a textile fibre. Wire-cloth of all degrees of strength and fineness of mesh is used for sifting and screening machinery, for draining paper pulp, for window screens, and for many other purposes. Vast quantities of copper and iron wire are employed for telegraph and telephone wires, and as conductors in electric lighting. It is in no less demand for fencing, and much is consumed in the construction of suspension bridges, and cages, &c.

In the manufacture of strung musical instruments and philosophical apparatus wire is again largely used. Among its other sources of consumption it is sufficient to mention pin and hair-pin making, the needle and fish-hook industries, nail, peg and rivet making, and carding machinery; indeed there are few industries into which it does not enter.

The physical properties requisite to make useful wire are possessed by only a limited number of metals and metallic alloys. The metals must in the first place be ductile; and, further, the wire when drawn out must possess a certain amount of tenacity, the quality on which the utility of wire principally depends. The metals suitable for wire, possessing almost equal ductility, are platinum, silver, iron, copper, aluminium and gold; and it is only from these and certain of their alloys with other metals, principally brass and bronze, that wire is prepared.

By careful treatment wire of excessive tenacity can be produced.

Dr. W. H. Wollaston first succeeded in drawing a platinum wire \( \frac{1}{100} \) inch in diameter by encasing a fine platinum wire within silver to ten times its diameter. The cored wire he then reduced to \( \frac{1}{100} \) inch, and by dissolving away the silver coating the platinum wire \( \frac{1}{100} \) inch thick only remained. By continued treatment in this way wires of platinum for spider-lines of telescopes have been obtained of such extreme tenacity that a mile length of the wire weighs not more than a grain; and it is said that platinum wire has been made which measures not more than \( \frac{1}{100} \) mm., equal to less than the fifty-thousandth part of an inch. The accompanying table shows the comparative tenacity of the wire of several and metallic alloys.

Wire was originally made by beating the metal out into plates, which were then cut into continuous strips, and afterwards rounded by beating. The art of wire-drawing does not appear to have been known in the 14th century, but it was practised in England before the second half of the 17th century. Wire is usually drawn of cylindrical form; but it may be made of any desired section by varying the outline of the holes in the draw-plate through which it is drawn, or by placing different dies in the plates of manufacture. The draw-plate or die is a piece of hard cast-iron or hard steel, or for fine work it may be a diamond or ruby. The object of utilizing precious stones is to enable the dies to be used for a considerable time without wear, and then to keep the die to softening. The form of a die in section is shown by fig. 1; the bell-mouthed opening receives the wire, and when it is pulled through the hole at the end its diameter becomes reduced accordingly.

The action of drawing has the effect of hardening the wire, and also rendering it brittle, so that annealing must be done immediately to soften it. Again for further drawing; the annealing is done in cast-iron pots, holding coils of wire which are raised to a red heat and then allowed to cool. Although the wire is kept air-tight as much as possible, some amount of scaling occurs, and pickling must be done to remove this scale before redrawing.

An important point in wire-drawing is that of lubrication to facilitate the operation and to lessen the wear on the dies. Various materials, such as oil, tallow, soapy water and scale bare are employed. Another method is to immerse the wire in a sulphate of copper solution, so that a film of copper is deposited which forms a good lubricant, easing the drawing. The end of the wire, the left of the copper is left after the final drawing to serve as a preventive of rust.

The wire-drawing machines include means for holding the dies accurately in position and for drawing the wire steadily through the holes. The usual design consists of a cast-iron bench or table having a bracket standing up to hold the die, and a vertical drum which rotates and by causing the wire around its surface pulls it through the hole. The wire may be started or stopped instantly.

The block is also tapered, so that the coil of wire may be easily slipped off upwards when finished. Before the wire can be attached to the block, it must be cut to the length of the die; this is effected by a pair of gripping pincers on the end of a chain which is wound around a revolving drum, so drawing the pincers along, and with the pincers on the wire, until the wire lies against the die to be held in place.

When the wire is on the block the latter is set in motion and the wire is drawn steady through the die; it is very important that the block shall rotate evenly and that it shall run true and pull the wire in an even manner, otherwise the "snatching" which occurs will break the wire, or at least weaken it in spots.

Single-wire machines differ from the single-block machines in having a series of dies through which the wire passes in a continuous manner. The difficulty of feeding between each die is solved by introducing a block between each, so that as the wire issues it coils around the block, and so on through the die, until it lies against the block on the opposite side, and is gathered together for the next die. The speeds of the blocks are increased successively, so that the elongation due to drawing is taken up and slip compensated for. The operation of the machine is that the wire enters the first die, which itself is so arranged that the wire is uncoiled, the amount of reduction effected; rates from 100 ft. up to 900 ft. are possible, the higher speeds being those of continuous machines.

Wires and cables for electrical purposes are made of various insulating materials, such as cotton, silk, jute and paper, wrapped in spiral fashion and further protected with substances such as paraffin, some kind of preservative compound, bitumen or lead sheathing of
steel taping. The stranded or covering machines employed in this work are of a very simple character, but require a constant supply of the wire which is passing through at a rapid rate. Some of the smallest machines for cotton covering have a large drum, which grips the wire and moves it through toothed gears at a definite speed. The wire is then passed over the drum, and finally down a long bed, and the disks carry each a number of bobbins varying from six to twelve or more in different machines. A supply of covering material is wound on each bobbin, and the end is led on to the feed rolls by means of ribbon. In the last machine of the series, the latter being revolved at a suitable speed bodily with their disks. The cotton is consequently served on to the wire, winding in spiral fashion, until the required length of covering is obtained. The various strands of the covering are concentric, the disks being duplicated, so that as many as sixty spools may be carried, the second set of strands being laid over the first. For the heavier cables, used for electric light and power, and submarine cables, bobbins are placed on a great drum. The steel wire is still carried through a hollow shaft, but the bobbins or spools of covering material are set with their spindles at right angles to the axis of the wire, and they lie in a circular cage which rotates on rollers below the frame, and in which a number of wires pass. In this way, the bobbins are kept in line, and each carries a definite number of wires, which pass on to the opposite cage of bobbins. Each cage carries a definite number of wires, and the cages are placed at different points along the axis of the wire, so that the wire passes from one cage to the next, and the various strands coming from the spools at various parts of the circumference of the cage all lead to a disk at the end of the hollow shaft. This disk has perforations through which each of the strands pass, thence being immediately wrapped on the cable, which slides through a bearing at this point. Toothed gears having certain definite ratios are used to cause the winding drum for the cable and the cage for the spools to rotate at suitable relative speeds which make the necessary corresponding movement of the covering material. Starting from a point, each spool of covering material rotates on its own shaft, and is treated with jute yarns or tapes and protected with coatings of compound. Messrs. Johnson & Phillips, Ltd., of Carlton, Kent, make a machine which is in use on the London and Birmingham Railway, and cover the wires with the preservation compound, in one continuous operation. The wire is carried on bobbins in two rotating cages, having twelve bobbins each, and the jute bobbins, seventy-two in number, are mounted on disks, while the compound is supplied from steam-heated tanks, through which the cable is passed by rollers. A machine of this class will turn out as much as 8 or 10 miles of line in 48 hours. When a supply of steel wire has been used up on the next portion of cable, the spools are put aside.

Tapes of paper, rubber or jute are served from bobbins on disks and in some designs from independent bobbins, each mounted on its own shaft, which are each at a suitable angle in a frame, to give the spiral lead. In some instances seventy-two layers of paper are applied to high-tension cables. These cables are subsequently put into steam-heated tanks, hermetically sealed and connected to a vacuum pump, by which the moisture is drawn off as quickly as possible. The cable is thoroughly dry a quantity of compound is admitted to the tank and so permeates the insulation. Lead is put on the outer layers of the wire, which passes through a cascade of wires, and is covered with a uniform coating or tube of lead, forced into the dies and around the cable by hydraulic pressure. The steel tapes are in some cases used to armour cables and protect them from damage. Wire taping is wound in a similar manner to the other materials already described.

Rubber covering of wires and cables is done by passing them through grooved rollers simultaneously with rubber strips above and below, so that the rubber is crushed on to the wires, the latter emerging as a wide band. The separate wires are parted forcibly, each retaining its rubber sheathing. Vulcanizing is afterwards done in steam jackets.

Many auxiliary machines are necessary in connexion with wire and cable-covering, as plant for preparing the rubber and paper, &c., cutting it into strips, winding it, measuring lengths, &c.

Wire Gauges. In commerce, the sizes of wires are estimated by gauges which consist of plates of circular or oblong form having notches of different widths round their edges to receive wire and measure the thicknesses. Each notch is stamped with a number, and the wire or sheet, which just fits a given notch, is stated to be of, say, No. 10, 11, 12, &c., of the wire gauge. But it is always necessary to state what particular gauge is used, since, unfortunately, uniformity is wanting. Holtzapfl the inventor of the subject, and published a valuable collection of facts relating thereto in 1846. A more exhaustive report was published by a committee of the Society of Telegraph Engineers in 1879. Several of these are drawn by special objects. When competition is keen, wire is commonly drawn by one gauge and sold by another; half sizes and quarter sizes are in constant use among the dealers, the wire being sold as whole sizes. Sometimes the gauge does not differ very much from the gauge of the maker, and the wire is sold in which the workmen are paid, and others by which the wire is sold. The whole system is in confusion, and lends itself to those who desire to use fraudulent practices. Thomas Hughes (The England Wire Gauge, London, 1879) stated that, "In

the same town some use Stubs, some the Warrington, some the Yorkshire, some the Birmingham, some the iron wire gauge and some the London and Birmingham Gauge. All maintain the gauge in their own possession to be the correct one."

Gauges may be broadly divided into two groups, the empirical and the rational. The empirical gauge is based on the observation that the number of drawings required for a given wire increases with the size of the wire. The rational gauge is based on the observation that the number of drawings required for a given wire is inversely proportional to the number of millimeters of wire. The origin of the B.W.G. is lost in obscurity. The number of wires were in common use earlier than 1735. It is believed that they originally were based on the same principle as the B.W.G. The B.W.G. is based on the same principle as the B.W.G. The number being based on an averaging of the dimensions collated from a large number of the former in the possession of Peter Stubs of Warrington, having long held the leading position, and are still retained and used under the name of Stubs’s wire gauge. There is no need, therefore, to give an account of the other and less known gauges which have been used by manufacturers. In no case is there any regular increment of dimensions from which a regular curve could be drawn.

The first attempt to adopt a geometrical system was made by Messrs. Brown & Sharpe in 1855. They established a regular progression of thirty-nine steps between the English size, No. 36 (460 miles) and No. 56 (5 miles). Each diameter was multiplied by 0.890522 to give the next lower size. This is now the American gauge, and is used to a considerable extent in the U.S.A. The British Standard Wire Gauge, which is sanctioned by the British Board of Trade, is one that was formulated by J. Latimer Clark. Incidentally, one of its recommendations is that it differs from pre-existing gauges scarcely more than they differ from itself. The divided wire, which is called a mill, no 7/10, the largest size, is 0.50 (500 miles) in diameter, and the smallest, No. 50, is 0.001 in. (1 mil) in diameter, the 0.001 in. length of the smallest size is known, diminished by 1/557 74, and the weight diminishes by 20%.

But the fact remains that a large number of gauges are still in common use, and that gauges of the same name differ and are therefore not authentic. Sheet iron wire gauges differ from Stubs’s steel wire gauge. Gauges for wire and plate differ. Accuracy can only be secured by specifying precisely the name of the gauge intended, or, what is generally better, the dimensions in decimals, which can always be tested with a micrometer. A decimal gauge has been proposed. Tables of decimal equivalents of the wire gauges have been prepared, and are helpful.

Gauges are circular forms, and are generally 3/4 in. in diameter, with thirty-six notches; many have the decimal equivalents of the sizes stamped on the back. Oblong plates are similarly notched. Rolling mill gauges are also oblong in form. The various gauges are made with a wedge-like slot into which the wire is thrust; one edge being graduated, the point at which the movement of the wire is arrested gives its size. The graduations are those of standard wire, or in thousands of an inch. In some cases both inch and millimeter graduations are employed for the sake of systems of measurement. A few gauges are made with holes into which the wire has to be thrust. All gauges are hardened and ground to dimensions.

WIREWORM, a popular name for the slender, hard-skinned grubs or larvae of the click-beetles or Blateridae, a family of the Coleoptera (q.v.). These larvae pass a long life (two or three years) in the soil, feeding on the roots of plants and they often cause much damage to farm crops of all kinds, but especially to cereals. A wireworm may be known by its broad, quadrilateral head and cylindrical or somewhat flattened body, all of whose segments are protected by a firm, chitinous cuticle. The three pairs of legs on the thoracic segments are short and the last abdominal segment is, as is frequently the case in beetle grubs, directed downwards to serve as a terminal proleg. The hinder end of the body is acutely pointed in the larvae of the species of Agriotes (A. obscurus and A. lineatus) that are the best known of the wireworms, but in another common form (the grub of Atheta haemorrhoidalis) the tail is bifid and beset with sharp processes. The subterranean habits of wireworms make it hard to exterminate them when they have once begun to attack a crop, and the most hopeful practice is, by rotation and by proper treatment of the land, to clear it of the insects before the seed be sown. Passing easily through the soil on account of their shape, wireworms travel from plant to plant and thus injure the roots of a large number in a short time. (See Economic Entomology.) Other subterranean creatures—such as the "leather-jacket" grub of crane-flies—which have no legs, and geophilid centipedes, which may have over two hundred, are often confounded with the six-legged wireworms.
WIRKSWORTH, a market town in the western parliamentary division of Derbyshire, England, 14 m. N.N.W. of Derby, on a branch of the Midland railway. Pop. of urban district (1901) 3807. It is picturesquely situated at the head of the valley of a small tributary of the Derwent, at an elevation exceeding 950 ft., and is almost enclosed by sharply rising hills. The cruciform church of St. Mary, with a central tower and short spire, is in great part Early English, with Perpendicular additions; but considerable traces of a Norman building were revealed during a modern restoration. There is a manufacture of tape in the town, and lead-mining and stone-quarrying are carried on in the neighbourhood; relics of the Roman working of the lead mines have been discovered. A large brass vessel used as a standard measure for the lead ore, and dating from the time of Henry VIII., is preserved.

WISBECH, a municipal borough, market town, and port in the Wisbech parliamentary division of Cambridgeshire, England, 68 m. N. of Cambridge, on the Great Eastern and the Great Northern and Midland joint railways. It lies in the flat fen country, on the river Nene (mainly on the east bank), 11 m. from its outlet on the Wash. By the Wisbech canal it has communication with the Ouse. The church of St. Peter and St. Paul has a double nave, with aisles, the north arcade being Norman; but the rest of the building is mainly Decorated and Perpendicular. There are remains of a Norman west tower; the churchyard has been extended on the north side of the nave. There contains a valuable library and various collection, including antiquities and objects of art and natural history. Other institutions include a grammar school founded in the middle of the 16th century and provided for by a charter of Edward VI., the Cambridgeshire hospital, a custom-house, a cattle-market, and an important corn-exchange, for Wisbech has a large trade in grain. A Gothic monument commemorates Thomas Clarkson (1760-1846), a powerful opponent of the slave-trade, and a native of the town. The shipping trade is carried on both at the town itself and at Sutton Bridge, 8 m. lower down the river. The chief imports are coal, timber, and iron, and the exports grain and other agricultural products and salt. Foreign trade is chiefly with the Russian Baltic ports. In the neighbourhood large quantities of fruit are grown, including apples, pears, plums, gooseberries, and strawberries. Potatoes, asparagus, and other vegetables are also grown for the London market. The town possesses agricultural implement works, coach-building works, breweries, ropeworks, planing and sawing mills, and corn and oil-cake mills. The borough is under a mayor, 6 aldermen, and 18 commoners. Area, 6476 acres.

The town is the site of a Roman settlement, i.e. Ossebech, (1200 ft.) a Roman embankment and tumuli. About 940 the manor is said to have been given to the abbey of Ely by Oswy and Leofele; the abbots held it in 1086; and it became attached to the see of Ely with the other possessions of the monastery. The castle is alleged to have been built by William I., and was converted from a fortress in the fens into an episcopal palace between 1471 and 1473. The growth of Wisbech depended on its position and episcopal patronage. In 1190 tenants of Wisbech Barton acquired an exemption from tolls throughout England, confirmed by John, Henry IV., and Henry V. The gift of the Holy Trinity was granted to the bishop of Ely in 1279. The manor still occupies by custom the interval between Lynn mart, of which it is probably an offshoot, and Stamford fair in mid-Lent. A pleasure fair, called the Statute Fair, takes place shortly before Michaelmas. Importance attaches to the horse fair, held in 1827 in the week before Whitsuntide and now on the second Thursday in May and on July 25, and to the cattle fair in the beginning of August. Saturday was market day in 1792; a corn market is now held on Saturday, a cattle market on Thursday and Saturday. In 1086 eels were prolific in Wisbech water. The port was noteworthy until a diversion of the Ouse, and a great outcrop of gravel, made it little accessible. Drainage restored trade before 1634, and the age of the Cut in 1702 was the beginning of prosperity. From 1783 to 1825 agricultural produce was exported and coal imported. Hemp and flax had an importance, lost between 1827 and 1849, but responsible in 1702 for fairs on Saturday and Monday before Palm Sunday. See W. Watson, History of Wisbech (Wisbech, 1827); N. Walker and W. Thomas, History of Wisbech (Wisbech, 1849); History of Wisbech (Wisbech and London, 1833).

WISCONSIN (known as "the Badger" state), one of the North Central states of the United States of America. It is bounded on the E. by Lake Michigan, on the N. by the Upper Peninsula of Michigan and Lake Superior, on the W. by Minnesota and Iowa, and on the S. by Illinois. Its greatest length from N. to S. (42° 30' N. Lat. to 47° 3' N. Lat.) is 350 m., and its greatest breadth (86° 49' W. Long. to 92° 54' W. Long.) is 250 m. The greater part of the western boundary separating the state from Minnesota and Iowa consists of the Mississippi and St. Croix rivers, with two flowing into Lake Superior. The Menominee and Montreal rivers form a considerable part of the boundary line on the N. and E., separating it from the Upper Peninsula of Michigan. The state's lake shore boundary is more than 550 m. long. Included in Wisconsin are the Apostle Islands in Lake Superior, and Washington Island and a group of smaller islands at the entrance to Green Bay on the Lake Michigan side. The state occupies a total area of 65,666 sq. m., 810 of which are water surface. Roughly speaking, it divides the Great Lakes region from the upper valley of the Mississippi.

Physical Features.—Wisconsin forms part of the inner margin of an ancient coastal plain and the oldland of crystalline rocks about which the plain sediments were deposited. The plain and the oldland were well worn down by erosion and then upfolded; were dissected by stream valleys, and were glaciated. The surface is generally rolling and undulating, comprising, with the Upper Peninsula of Michigan, a swelling elevation of land between the three depressions represented by Lakes Michigan and Superior and the Mississippi and the St. Croix rivers. The lowest elevations are in the southern and central portions of the state, where the altitude is less than 500 ft.; but in the northern counties some of the high points in the state are residual masses of relatively resistant rock rising above the erosion surface; such are: Rib Hill (1940 ft.) in Marathon county, in the north-central part, and some of the peaks on the extreme N. margin of the state, which are about 1800 ft. high. From the N. highland two heights of land (1200 to 1600 ft.) extend southward well into the central portions of the state, dividing the greater part of its area into two natural drainage basins. The westernmost of these elevations are the Driftless Areas of the Mississippi, and the St. Croix from that of the Wisconsin river. The eastern elevation is a ridge or cuesta formed by an outcropping hard layer of the ancient coastal plain; and it separates the Wisconsin river basin from the Fox River Valley and the streams flowing into Lake Michigan. Along the Mississippi and the Wisconsin a long line of bluffs varying in height from 200 to 300 ft., and in the E. a rocky limestone ridge or cuesta some 30 m. back from Lake Michigan extends from the Door county peninsula, E. of Lake Winnebago and as far south as the Illinois line. There are no large rivers flowing south from Wisconsin, but nearly all the rivers flow, some of them for a distance of little less than 50 m., from a point some 30 m. S. of the lake all the streams flow in a southerly direction. The Mississippi is the drainage basin for a greater part of the state. The St. Croix river rises in the S.W. part of the Penokee Range and flows W. and S., forming the western boundary of the state for 135 m. before it joins the Mississippi 20 m. below St. Paul. Before it is joined by the Wisconsin, the Mississippi

1 The Badger is not found in the state, and the name probably originated as a nickname for those lead miners N. of the Illinois line, who, having come from Wisconsin, were often known by the side burrows of the Badger, and who did not go home in winter like the miners from southern Illinois and farther south, who were called "Rockers," a name borrowed from the migrating fish in the Rock, Illinois, and other rivers; and the name was applied generally to all the people of Illinois, and the name "badgers" to the people of Wisconsin and "badger state" to the state.

Besides the area as given, the state has jurisdiction over approximately 7500 sq. m. of Lake Michigan and 2378 sq. m. of Lake Superior.
WISCONSIN

receives several rivers of considerable length, the most important of which are the Chippewa and the Black. The Wisconsin river rises on the west side of the state near the border with Minnesota, and joining the Mississippi near Prairie du Chien. It is navigable as far as Portage, some 200 m. from its mouth. The Fox river (more than 260 m. long) rises in the south central portion of the state, flows N. and W. through Wisconsin Rapids and W. to Green Bay, and enters N. into Green Bay, and is the longest and most important stream draining into Lake Michigan. The Wolf river is its most important tributary, joining it near Wausau. Numerous smaller streams drain into the Lake Michigan basin. Among these are the Menominee and Oconto, which flow into Green Bay; an arm of Lake Michigan, and the Sheboygan and Milwaukee rivers, which drain into Lake Michigan. The only considerable lake in the state is drained by several streams flowing across the Illinois boundary and finding their way eventually through other rivers into the Mississippi. The largest of these are the Rock, Des Plaines, Fox (of the Wisconsin), Chicago, Oshkosh, Fond du Lac, Neenah and Menasha, and through it flows the Fox river. In the S. and E. portions of the state the lakes are beautiful clear bodies of water with sandy or gravelly shores, and, as a rule, shallow near the shore, with deep beds. In the Wisconsin state, notably Lake Geneva, Green Lake, the lakes inaukewa county and the famous "four lakes" near Madison.

Flora and Fauna.—Wisconsin was originally the native home of a great variety of wild and animals and found in the other Northern states. Deer were found in large numbers in all sections of the state, bear were common in the central and northern parts, bison were found in the southern parts of the state, wolves and lynxes, and other smaller animals, particularly of fur-bearing varieties. The streams abounded in fish. The abundance of game made the region between the lakes and the Mississippi a favourite hunting ground of the early traders and was an important source of income to the trader. Bear, deer and lynx are still to be found in the less settled forest regions of the N. parts, and the fisheries are still important.

The ant-floral life of Wisconsin is exceedingly varied; C. B. (see 1692), collected 1,268 species in 1890. man and woman, with the flora of the state, and of these probably not less than 350 occur in Wisconsin. The more characteristic and useful birds include many species of the sparrow, such as the song, swamp, Lincoln's chipmunk and field sparrow; the black, barn, cliff, white-beckled and rough-winged swallow, as well as the purple martin and the chimney swift; ten or more species of fly-catchers, including the least, arcadian, phoebe, wood, hermit, king, brownish, grey-necked and the fire; woodpeckers, of which the more common are the downy, hairy, yellow, black and golden-winged (flicker); about thirty species of warblers, including the parula, cerulean, Blackburnian, prothonotary, yellow-throated, chestnut-sided, Cape May and chestnut-breast, siskins and other species of vireos. The song-birds are well represented in the hermit thrush, wood thrush, Wilson's thrush (or veery), brown thrasher, red-winged blackbird, robins, mockingbirds, blue jay, cowbird, and other species. The bobwhite, which has also a considerable number of the game birds are the ruffed grouse (partridge), quail, prairie hen and wild turkey. The birds of prey include the red-shouldered, red-tailed, broad-winged, Cooper's sharp-shinned and sparrow hawk and the bald eagle; the great horned, barred, barn, snow, short-eared and screech owls. The ducks include the mallard, black duck, canvas-back and red-head; the Canadian goose, the snowy goose and the garganey also have a considerable number of the state. The prairie dogs and the gopher are also numerous.

The climate is about that of a temperate climate. Wisconsin was covered with forests, although in the S. and W. there were considerable tracts of rolling prairie lands. In the S. portion of the predominating forests are the white oak and pitch pine; in the W. the white oak, pitch pine, and W., an enormous and unbroken forest of pines, hemlocks and spruce.

Climate.—The climate of the whole state is influenced by the Atlantic Ocean, but the extreme cold is moderated by the Great Lakes. The winters, especially in the central and northern sections, are long and severe, and the weather is usually dry and unhealthy. The summers, especially in the southern sections, are very warm; but the air is so dry that cold and heat are less felt than they are in some humid climates with less extreme temperature. The mean annual temperature for the state is 44° F. July, with an average temperature for the state is 70°, is the warmest month, and February, with an average of 15° is the coldest. During the period of thirty-eight years, from 1870 to 1908, extremes at Milwaukee ranged from 104° to 25°, while at

La Crosse, on the western border and less than 60 m. farther north, they ranged during the same period from 104° to 43°. The greatest extremes were recorded at Milwaukee, where they range from 111° in 1870 to 50° in 1908. Two-thirds of the state has an annual precipitation of over twenty inches, with some parts of the southern portion of the state receiving as much as thirty inches every year. The average annual precipitation of the state is 36 in. in the central section, which is quite evenly distributed through the months of December, January, February and March. In the northern section the heavy snowfall is caused by the cyclonic storms which abound in this section. The amount of snowfall is increased by the storms which ascend the Mississippi Valley. All sections of the state are subject to tornadoes. They occur more frequently in the westward portion than in the eastern portion, but not in the most destructive numbers.

The raising of five-stock, particularly of dairy cows, is an important industry. In 1910, out of a total of 2,187,000 neat cattle, there were 1,566,000 milk cows. The total number of horses in the state was 600,000, valued at $34,000,000, valued at $29,000,000. There were 1,034,000 sheep, and 1,651,000 swine.

Manufactures.—The growth of manufacturing has been rapid in Wisconsin. In 1850 the value of the manufactures was $2,925,668; in 1860, $27,849,167; in 1870, $77,214,526; in 1880, $28,255,480; in 1890, $248,546,164; and in 1900, $360,819,942. The product under the factory system, excluding hand trades and neighbourhood industries, was valued in 1899 at $34,340,000, while in 1905 it had increased to $34,340,000. The most important of the state's manufactures in 1900 and 1905 were lumber and timber products, valued in the latter year at $43,359,766 (Wisconsin being second in rank to the state of Washington); next in order were 60% of the total value of the factories at $15,150,000 of the value of the factories at $15,150,000 in 1905. The raising of five-stock, particularly of dairy cows, is an important industry. In 1910, out of a total of 2,187,000 neat cattle, there were 1,566,000 milk cows. The total number of horses in the state was 600,000, valued at $34,000,000.
furniture in Wisconsin is centralized especially in Sheboygan, where in 1905 was manufactured about one-third of the furniture made in the state.

** Mines and Quarries.**—The lead mines of south-western Wisconsin probably were worked as early as 1679 by the French, while the earliest records of the lead deposits in Iron and Ashland counties are in 1840; in 1855, 1862, 1871, 1897, and 1907 there were respectively 276,017, 277,531, 253,973, 26,196, and 16,000 pounds of lead ore valued at $1,734,307, $2,066,034, $1,906,020, $184,090, and $761,830. The Culmination of mining in the lead industry was in 1902, when 277,531 pounds were taken for a value of $2,449,711, but in 1908 the output was down to 26,196 pounds worth $753,930. The same reduce Golden. 

The output of ore iron in the Gogebic and Menominee ranges on the upper Michigan border is important. Some was worked in Door county in the 1850's but not since. The iron deposits in Florence county were first worked, and in 1882 276,017 tons were shipped from that county; and about 1884 began the development of the Copper deposits in Iron and Ashland counties. The maximum output was in 1890, being 948,665 long tons; in 1902 it was 783,966 long tons (79% from Iron county); and in 1906, 733,993 tons. The output is almost entirely haematite. There are large deposits of stratified clay along the shores of Lake Michigan, from which is made a colour-ned loam, so largely used in Milwaukee that this city has been called the “cement city”; the total value of clay products in 1907 was $1,217,819 and in 1908 $895,618. The output of the value of quartz, granite, and stone, which was valued in 1908 at $8,520,000, including granite ($1,595,781), limestone ($1,102,000) and sandstone ($219,130). In 1908, 2,243,579 long tons of limestone were valued at $340,000, the total output of this mineral was 40% of the total output in 1908, which was valued at $1,102,000, was used for road-making and more than one-sixth in the manufacture of concrete. In 1902, Wisconsin ranked first in the union in producing granite, and had 20,950,000 tons valued at $8,520,000 of the value of limestone quarried. The first limestone quarries were opened at Genesee, Waukesha county, in 1848; at Wauwatosa, near Milwaukee, in 1855; and at Bridgeport in 1856. Freshwater pearls are found at the mouth of the St. Croix river. Wisconsin ranked first among the states in the value of mineral waters sold, with a value of $1,526,703 in 1907 and $1,413,107 in 1908. It is probable that in both years the quantity sold in Wisconsin was less than in Minnesota or in New York. The most famous of these springs are in Waukesha county, whence White Rock, Bethesda, Clysme and other waters are shipped.

In 1890 and in 1900 (when the wooded area was estimated at 31,750 sq. m., or 58% of the total area of the state) Wisconsin was the foremost state in the Union in the production of lumber and timber. In 1905 the value of the lumber and timber products was $106,000,000; but in 1908 it was $67,900,000. Wisconsin was the chief source of the white pine supply. Next to white pine (used largely in shipbuilding) in value in 1908 was red or northern pine for the house building trade (used for lumber and wood pulp) and white spruce, a very valuable lumber tree. In 1908 the area of the state forest reserve lands under a state board of forestry (chiefly in Oneida, Forest, Iron, Price and Vilas counties) was 1,773 acres. Forest fires have been numerous and exceedingly destructive in Wisconsin; the loss of timber and other property from this cause in 1908 was about $9,000,000.

**Fisheries.**—The fisheries of Wisconsin are of considerable importance; the catch in 1908 was valued at $4,067,170, lake trout and herring being the most valuable. There is a state board of commissioners of fisheries (see below, § Government), which distributed in 1908 $149,338,669 eggs, fry and fingerlings, including 112,675,000 walleye, valued at $13,300,000; and about 26,000,000 of lake trout and whitefish. There are state hatcheries at Madison (for brook and rainbow trout), Bayfield (brook and lake trout and whitefish), Oskskosh (lake trout and whitefish), La Crosse (brook and walleye-pike), Minnesota (lake trout and walleye), Delafield (black bass and wall-eye pike) and Wild Rose (brook trout).

**Transportation and Commerce.**—Railway building in Wisconsin began in 1851, when a track was laid from Milwaukee to Waukesha and La Crosse. A railroad from Wisconsin to Michigan was completed in 1857 to the Mississippi at Prairie du Chien. This line was the forerunner of the great Chicago, Milwaukee & St Paul system, which now extends from Chicago to the Upper半岛 and has about 2,300 miles of track with two of its lines running north and south, and two running east and west. The Chicago & North-Western and the Chicago, St Paul, Minneapolis & Omaha, Red River, and Western tiy, formerly the Chicago, Milwaukee & Western, and the Northern (built in 1855 and to Fond du Lac in 1858) form a network in the eastern part of the state, affording direct connections with Chicago. The Chicago, St Paul, Minneapolis & Omaha extends into the western part of the state, where it connects with the trans-Mississippi

1 The Fox and Wisconsin rivers are separated by Portage by a distance of only 2 m. 
2 At each preceding census the population was as follows: (1840) 309,495, (1850) 308,391, (1860) 775,881, (1870) 1,064,670. By the census of 1900 it was 2,225,949.
School, Winnebago (1904) under the Wittenberg School and Pota-
watomi (449) not under an agent. The civilized Brotherton and
Stockbridge Indians live principally in Calumet county. Among
religious denominations the Roman Catholics, with 908,264 members
in 1906, had 50.4% of the total communicants or church members
in the state. The Lutheran bodies ranked next with 284,286
members (including 153,690 of the Evangelical church, 49,535 of the
Norwegian Evangelical church, 22,875 of the Norwegian
Evangelical church, 15,471 of the Evangelical Lutheran Church
of Iowa, and 15,220 of the Evangelical Lutheran Synod of Iowa
and 286 of the General Council). Only one other state (Pennsylvania)
had more than half of the total communicants of this denomination.
There were 57,473 Methodists (chiefly of the Methodist Episcopal
Church), 26,163 Congregationalists and 21,716 Baptists.

Government.—The original constitution of the state, adopted
in 1848, and amended in 1869, 1870, 1874, 1877, 1881, 1882,
1903 and 1908, is still in force. An amendment may be proposed
by either house of the legislature, and if passed by two successive
legislatures by a majority of the members elected to each house
must be submitted to the people for ratification by a majority
vote. A constitutional convention may be called on the recom-
mendation of a majority of the Senate and Assembly if this
proposal receives a majority vote at the next election for members
of the legislature. Suffrage was originally granted to every
male twenty-one years of age or upwards resident in the state
for one year preceding any election—if he were a white citizen
of the United States, or a white of foreign birth who had declared
his intention to be naturalized, or an Indian declared by Congress
a citizen of the United States, or a civilized person of Indian
descent who has been domiciled in the state for five years,
providing that the legislature might by law give suffrage to others
than those enumerated if such an act of legislature were approved
by a majority of the popular vote at a general election. By
an amendment of 1882 the word “white” was omitted and by
an amendment of 1908 the term “white of foreign birth” was
omitted, and naturalization in order to become electors must have
dedicated their intentions to become citizens before the 1st of December
1906, and that “the rights hereby granted to such persons
shall cease on the first day of December A.D. 1912.” The amend-
ment of 1908 also permits the legislature to provide for the
registration of electors in incorporated cities and villages.

The official ballot is of the blanket type, with names of candid-
dates in party columns, but with no candidate’s name repeated
on the ballot and with no emblems to mark the party columns.
In 1909 an act was passed permitting county boards to adopt a
“coupon” ballot. Since 1905 there has been a direct nominating
system of primaries for all officers except delegates to national
nominating conventions.

Executive power is vested in a governor and a lieutenant-
governor elected for two years. The governor’s salary (since
1869) is $5000 a year and the lieutenant-governor’s $3000.
Candidates for either office must be citizens of the United States
and qualified electors of the state. The lieutenant-governor is pre-
sident of the Senate with a casting vote only. A bill vetoed by
the governor becomes a law if it is approved by two-thirds
of the members present in each house; and a bill not returned
by the governor within six days (excepting Sunday; before 1908
the constitutional limit was three days) after its presentation
to the governor becomes a law unless the return of the bill is prevented
by the adjournment of the legislature. The governor has power
to grant reprieves, commutations and pardons, except fines—
he may suspend execution of sentence for treason until action
is taken by the legislature—and in cases of impeachment.

The administrative officers, a secretary of state, a treasurer
and an attorney-general, are elected for two years and as
commissioners of public lands. The secretary of state is ex-
efficio auditor; and he acts as governor if the regularly elected
governor and lieutenant-governor die, are removed from office
or are absent from the state. A state superintendent of public
instruction is chosen by popular vote for a four-year term.
Other administrative officers are a commissioner of insurance
(from 1887 to 1878 the secretary of the state was commissioner
of insurance; the office became elective in 1881); a commissioner
of labour and industrial statistics; three railroad commissioners,
who have jurisdiction over all public utilities, including telegraph
and telephone; a commissioner of banking; a dairy and food
commissioner; a state superintendent of public property;
three tax commissioners who act (since 1901) as a state board
of assessment; commissioners of fisheries (established 1874); a
state board of agriculture (1879); and a state board of forestry
(1875). Under the constitution of 1848, the legislature
meets biennially, and when called in special session by the governor
to transact special business indefinitely named in the governor’s
call. The number of assemblymen cannot be less than 54 or
more than 100, and the number of senators must be not more
than one-third or less than one-fourth the number of members
of the Assembly. In 1910 there were 33 senators and 100 assemblymen.
Elections to the Senate and Assembly are biennial and the term
of members of the Assembly is two years, but the senatorial
term is four years and each year one-third of the members are elected
every two years. A candidate for either house must have lived
in the state at least one year, must be a qualified elector in the
district from which he is chosen, and may not be a member
of Congress or hold any military or civil office under the
United States. Since 1852 a state census has been taken every ten
years, and on the basis of these censuses the legislature reapportions
the Senate and Assembly districts. Each member of the legis-
lature receives $300 a year and 10 cents a mile for mileage.
Any bill may originate in either house, and either house may
be passed by the other. Special legislation of several
specified kinds is forbidden, especially by amendments of 1857
and 1862; and the constitution as adopted in 1848 prohibited
the legislature’s authorizing any lottery or granting any divorce.
The Assembly may impeach civil officers by a majority of all
elected members, and the Senate to try impeachments; for
conviction a two-thirds vote of all members present is required.
The judicial power of the state is vested in a supreme
court of seven members (salary $6000 a year; elected for
ten years; the senior justice is chief justice) with
appellate jurisdiction throughout the state, general superintend-
ency of inferior courts, power to issue, hear and determine
writs of habeas corpus, mandamus, injunction, certiorari and other original
and remedial writs; nineteen (only five under the constitution of 1848) circuit
courts, of one judge each except in the second circuit (including Milwaukee)
in which there are four judges, elected (at a spring election, and not at
the general state election) by the voters of the circuit district;
probate judges, one elected (for two years) in each county,
except where the legislature confers probate powers on inferior
courts; and in towns, cities and villages, justices of the peace,
elected for two years.

Local Government.—Wisconsin has the mixed or township-county
system of local government. Each township (or “town,” as it is
commonly called) elects at its annual town meeting on the first
Tuesday in April three supervisors, a clerk, a treasurer, one or
more assessors, two justices of the peace, from one to three constables,
and, if the town has a library, a librarian. Justices of the peace
hold office for two years, other town officers for one year only,
except that in a county having a population of 100,000 or more (Milwaukee
county), town meetings are biennial and all officers are elected
for two years. For other than school purposes rates must not exceed
2% of the assessed valuation of the taxable property in the
The chairmen of the several town boards of supervisors, with the
1 Excepting persons under guardianship, those weak-minded or
inescapable, those convicted (without restoration to civil rights) of treason
or felony, and those who have engaged (directly or indirectly) in a
duel.
2 The coupon ballot was proposed for use throughout the state,
but was defeated by popular vote in 1906. In April 1907 the ticket was made up
of as many coloured sheets as there are party organizations (plus
one for independent nominations), and the name of each candidate
is on a perforated slip, which must be detached if it is to be voted.
3 The office of railroad commissioner was created in 1874, became
elective in 1881 and was replaced under an act of 1905 by a com-
misson of three members, who received jurisdiction over other
public service corporations in 1897.
4 Until 1881 elections to the legislature were held annually, and
the term of assemblymen was one year and of senators two years.
5 Not separately organized until 1853; the judges of the circuit
court acted as justices of the supreme court.
levied on an *ad valorem* basis; but telephone companies are taxed by collecting a percentage of the gross receipts. Insurance companies are subject to a tax based on a percentage of premiums. In addition, the state requires banks to file an annual report with the commissioner of banks, and this information is used to enforce the provisions of the banking statute.

A poll tax was levied for highway purposes in towns and villages, but the general charter law does not provide for the collection of these taxes. In addition, the state constitution forbidding the legislature to charter a bank or pass a general banking law until the people had voted in favor of banks, and providing further that no bank charter or general banking law shall be of any force until the charter or law is examined and approved by the commission in any city of the second, third, or fourth class, which votes for this form of government at an election called by a petition signed by 25% of the voters at the preceding election for mayor.

**Miscellaneous Laws.**—A married woman may manage her separate property as if she were single. A widow is entitled to a dower in one-third of her husband’s real estate, and a widower is entitled to a dower in any real estate of which he died seized and disposed of by his last will, unless she leaves issue by a former husband to whom the estate might descend, in which case her estate passes immediately to such issue. If either husband or wife dies intestate and leaves surviving, or if the surviving spouse is entitled to the real estate of the deceased, both real and personal. The causes for an absolute divorce are adultery, impotency, sentence to imprisonment for more than ten years or more than three years for a capital or an habitual criminal, the cruel or inhuman treatment, habitual drunkenness and voluntary separation for five years. For any other cause than adultery an action for a divorce cannot be brought unless one of the parties has been separated and actually habitually absent for two years immediately preceding the suit. Neither party is permitted to marry a third party until one year after the divorce has been obtained. Adultery is punishable by imprisonment in the state prison for not more than three years or not less than one year, or by a fine not exceeding $1000 or not less than $200. A husband who wilfully abandons his wife, leaving her destitute, or who refuses to support her when he is able to do so, may be punished by imprisonment in a state prison for not more than one year or in the county jail or workhouse not more than six months, nor less than fifteen days, and for ten days, in the discretion of the judge, he may be kept on a bread and water diet. A homestead owned by the husband or the wife of the state and consisting of not more than 40 acres of agricultural land outside the limits of a city or village, or one-fourth of an acre within a city or village, together with the dwelling-house and other appurtenances, is exempt from liability for debts other than laborers’, mechanics’, and pur- chase-money liens, mortgages and taxes. If the homestead is sold the proceeds from the sale, at an amount not exceeding $5000, are likewise exempt for a period of two years for the purpose of procuring another homestead. If the owner is a married man his homestead cannot be sold or mortgaged without his wife’s consent. The employment of children under fourteen years of age for money, work or board, in business, workshops, or on the farm, hunting deer or game, or in a tobacco garden is forbidden, and their employment at any gainful occupation is permitted only during the vacation of the public schools. A child between the ages of sixteen and twenty-one years may be employed in a gainful occupation only upon the recommendation of the school principal or clerk of the board of education. No child under sixteen years of age may be employed longer than fifty-five hours in any one week, more than ten hours in any one day, more than six days in any one week, or between 6:00 p.m. and 7:00 a.m. Other radical legislation, especially in regard to railroads, has included: the Porter Law, regulating rates, which was enacted in 1874 during the “Granger Movement,” was modified from time to time, and was displaced by a law of 1905 (in 1908 declared constitutional) so long as stockholders receive a reasonable compensation. rate-making state railroad commission, and the physical valuation of railways on an *ad valorem* basis for taxation; a law (1907) making 2 cents a mile the maximum fare; an anti-tipping law (1909); a law forbidding the sale of cigarettes; an act (1907) regulating the powers and duties of the superintendent of public instruction; which has both parochial and non-parochial business; and an eight-hour labor law in effect on the 1st of January 1908.

Revenue for state purposes is derived principally from taxes on corporations, from an inheritance tax and from departmental and institutional fees and charges; that for counties, towns, villages and cities from a general property tax. The general property tax has long been employed almost wholly for educational purposes only. The state tax on railways and other public service corporations is

---

1 The first class comprises cities having a population of 150,000 or more (Milwaukee); the second class those having a population between 40,000 and 150,000; the third class those having a population between 10,000 and 40,000; the fourth class those having a population less than 10,000.
After probably 1887; had been Clara inspection law (1903), chosen in the state was $13,547,574; of this sum $10,604,204 was spent for common schools, high schools and graded schools, $1,001,155 for the university, and $547,661 for normal schools. The total income for schools in 1907–1908 was $1,773,659, of which $1,379,410 was from the seven-tenths-of-a-mill tax, $200,000 was from licence fees and taxes upon corporations (for salaries of rural school inspectors) and $140,249 the income from the common school fund which in that year amounted to $3,845,929.

Educational institutions of collegiate rank are Beloit College (1846; originally Congregational, now denominational) at Beloit; Carroll College (1846, Presbyterian), at Waukesha; Lawrence College (1847; Methodist Episcopal), at Appleton; Concordia College (1881; Lutheran), Marquette University (1884, Roman Catholic), and Milwaukee-Downer College (1895; non-sectarian, for women; an outgrowth of Downer College, Congregational and Presbyterian, founded at Fox Lake in 1853), all at Milwaukee; Milton College (1867; Seventh Day Adventist), at Milton; North-western University (1865; Lutheran) at Watertown; Ripon College (1845; originally under Presbyterian and then under Episcopal control) and five co-educational; and Wayland University (1855; co-educational; Baptist), at Beaver Dam; and the following Roman Catholic schools: St Clara Academy (1847; Dominican) at Sinsinawa, St Francis Seminary (1853) at St Francis, and St Lawrence College (1864, Capuchin) at Mt Calvary. There are also many private academies and trade or technical schools, and six industrial schools for Indians.

Charitable and Penal Institutions.—In the number and equipment of these institutions, Wisconsin is among the most fortunate states, and stands high. These institutions are under the general direction of a state board of control (established in 1905) of five members (one a woman), appointed by the governor for a term of five years. This board has charge of the following institutions: a State Hospital for the Insane (1860) at Mendota; the Northern Hospital for the Insane (1873) at Winnebago, 4 m. N. of Oshkosh; a School for the Deaf (1852) at Delavan, Walworth county, in which the teaching is conducted in an institution of which includes a high-stake school; a School for the Blind (1849; taken over by the state in 1850) at Janesville; an Industrial School for Boys (opened in 1866, as a House of Refuge) at Waupun; a Boys State Prison at Waupun; State Public School for Dependent and Neglected Children (1886) at Sparta, with a farm of 234 acres; Wisconsin Home for Feeble Minded (1896) at Chippewa Falls; Wisconsin State Reformatory (flagstaff) at Milky Lake (Milwaukee county); a Sanatorium (1907) at West, Sauk county. In addition the board has partial control over the Wisconsin Workshop for the Blind (1905) at Milwaukee, where there is a willow ware factory, and the Wisconsin Industrial School for Girls (1875) also at Milwaukwe. Its powers of inspection extend over 5 semi-state institutions, 33 county insane asylums, 69 gaols, 48 poor-houses, 50 private beneficent institutions and 206 police stations and lockups. The board has also power of visitation and inspection over the Wisconsin Veterans' Home at Waupeaca, founded in 1887 by the state department of the Grand Army of the Republic. In the state there are orphan asylums of which includes a high-stake school for girls, and a school for the county asylums. The labour of convicts in the state prison is leased; until 1878 the state itself supervised manufacturing in the public works; the state is now supervising, instead of manufacturing, in making shoes for a Chicago firm; and since 1903 the state has received 64 cents a day for the labour of each convict, and at least 300 convicts are employed in the manufacture of socks and stockings, from which in 1906–1908 (two years) the income to the state was $156,890. In 1910 a binding twin factory was established in the prison. In the state reformatory the labour of some inmates is leased to tailors, and the others make brooms or bricks, or work in the laundry. In Wisconsin, as in other states, the labour of convicts is used in force for prisoners with a good record at the state prison. By a law of 1909 certain offenders are placed under probation under the supervision of the probation board.

History.—Politically Wisconsin has been under French domination (from 1634 to 1760); under British domination (from 1760, formally 1763, to 1783); and under that of the United States since 1783. But the British influence on the community was negligible, and British rule was never more than nominal and was confined to the military posts. When American troops occupied the posts at Green Bay and Prairie du Chien in 1816, thirty-three years after it had become a part of the territory of the United States, the region was still almost exclusively French in manners, customs and population; and so it remained for nearly two decades, possible it was, in 1837, that the region was still occupied by the French.

The region comprised in the present state of Wisconsin, when first explored by Europeans, was a favourite hunting-ground for the Indians who constantly crossed this region between the Great Lakes and the upper Mississippi. The Indian population of Wisconsin in the first half of the 17th century was probably larger than that of any region of similar size east of the Mississippi. Among the many different tribes were the Sioux, Chippewa, Kickapoo, Menominee, Mascoutin, Potawatomi, Winnebago, and Sauk and Foxes. In the eastern and southern portions of the region there are still numerous mounds, the relics of an earlier Indian civilization. In the lead regions in the S.W., with the help of Pawnee slaves, the Indians worked the lead diggings in a rough way. The whole course of the early history of Wisconsin was profoundly influenced by these racial and geographic considerations. The French adventurers, bent on finding either a "North-west passage" or some land route to the Pacific (which they believed to be no farther west than the Mississippi), naturally went west by the water routes of Wisconsin; as a fine field for their bartering and trading with water-courses by which they could convey their pelts and skins back to Montreal, the region attracted the trappers and traders. The first to arrive were the zealous French Catholic missionaries. The impelling influences on the French settlement of the region were the love of exploration and adventure, the commercial instinct and religious zeal.

Jean Nicolet, an experienced explorer, was sent west by Samuel de Champlain, the governor-general of New France, in the summer of 1634 to investigate mysterious rumours of a people known as "the men of the sea" who were thought by some to be Tartars or Chinese. After a long and difficult journey into a region which he seems to have been the first white man to enter, Nicolet landed on the soil of Wisconsin at a point on Green Bay about 15 m. below the present city of Green Bay. Near what is now known as Red Banks there was a populous village of Winnebago, which welcomed and entertained him. He made a treaty with the Indians, went up the Fox river to a point somewhere near the present city of Berlin (Green Lake county) where he found another large village, and returned to Green Bay and thence to his post on Lake Huron.

Twenty years later Pierre Esprit, Sieur de Radisson, and Medard Chouart, Sieur des Groseilliers, started (1654) from Quebec, crossed Lakes Huron and Michigan, wintered in Wisconsin, ascended the Fox, crossed to the Wisconsin and presumably reached the Mississippi river eighteen years before Jacques Marquette and Louis Joliet. In 1659–1660 they were again in the West, but the opposition of the French authorities prevented their further explorations.

The first of the missionary pioneers was the Jesuit, Father René Ménard, who in 1651 lost his life on the upper Wisconsin river. In 1665 Father Claude Allouez established the first permanent mission in Wisconsin on the shores of Chequamegon Bay, near the first trading post established by Radisson and Groseilliers. In 1675 Father Louis Hennepin was succeeded by Father Jacques Marquette (1637) and went to the Fox River valley; there he established the mission of St Francis Xavier at the first rapids on the Fox river near a populous Indian village. About this mission, one...
of the most successful established by the Jesuits in the West, gathered a group of traders who formed a settlement that for many years existed as a transient post and storehouse for trappers.

Father Marquette, forced in 1671 by Indian wars to abandon his post on Chequamegon Bay, settled with the Huron at the Straits of Mackinac, whence in May 1673 accompanied by Louis Joliet he set out for the Mississippi river. They halted at De Pere, set off down the Fox-Wisconsin route, followed the Wisconsin to its mouth and came out upon the Mississippi near the site of the present city of Prairie du Chien, on July 17th, exactly two months after they left St Ignace mission on Mackinac Island. After descending the Mississippi to the mouth of the Arkansas they returned by way of the Des Plaines portage, paddled along the western shore of Lake Michigan, and arrived at De Pere. In September 1679 Robert Cavelier, Sieur de la Salle, and Henri de Tonty entered the mouth of the Fox river in the "Griffin," the first ship to sail the Great Lakes. In the same year Daniel Greysolon Du Luth, a coureur de bois, explored the upper Mississippi and the Wisconsin and Black rivers. In 1680 Father Louis Hennepin, a Recollect Franciscan who had accompanied La Salle, followed the Wisconsin northward from the mouth of the Fox to the vicinity of the St. Croix river, along the western border of Wisconsin to the site of the present city of St. Paul. The same course was followed by the fur-trader, Pierre Charles Le Sueur, in 1683.

In 1671 Simon François Daumont Saint-Lussou at Sault Ste Marie had taken formal possession of the region in the name of the king of France; in 1685 Nicolas Perrot (1644-1700), a trader who had first visited the wilds of Wisconsin probably as early as 1665, was appointed "commandant of the West," and this event closes the period of exploration and begins that of actual occupation. Traders had begun to swarm into the country in increasing numbers, and to protect them from the Indians and to control properly the licensed fur-trade a military force was necessary. Perrot built a chain of forts along the Mississippi and a post (the present Galena, Illinois) near the southern boundary of the state, where he discovered and worked a lead mine. In 1712 the slaughter of a band of Foxes near Detroit was the signal for hostilities which lasted almost continuously until 1740, and in which every tribe in the Wisconsin country was sooner or later involved either in alliance with the Foxes or with the French; the Chippewa, always hostile to the Foxes, the Potawatomi and the Menominee sided with the French. This war seriously interfered with the French plans of trade development and exploitation, and by rendering difficult the maintenance of a chain of settlements which might have connected Canada and Louisiana was a contributing cause of the final overthrow of French dominion. In this period permanent military posts were established at Green Bay and Chequamegon (1718); in 1718 it was reported that traders had settled at Green Bay and De Pere; in 1727 a post was established on Lake Pepin.

Wisconsin was little disturbed by the Seven Years' War. Yet the French and Indians of Wisconsin contributed their quota to the French armies—a force of half-breeds and Indians under a half-breed, Charles Michel de Langlade (1729-1800). After the fall of Montreal (Sept. 1760) Robert Rogers, who had been sent to Detroit to occupy the French posts in the West, dispatched Captain Henry Ballour with a force of British and Colonial troops to garrison Mackinac and the Wisconsin posts which had been dismantled and were almost deserted. He arrived at La Baye (Green Bay) in October 1761, and left there a garrison under Lieut. James Gorrell of the 6th (Royal American Foot) Regiment. The traders who accompanied them were the nucleus of the first English-speaking colony on Wisconsin soil. The French fort was rechristened Fort Edward Augustus. The period of British occupation was brief. On the outbreak of the conspiracy of Pontiac Lieut. Gorrell was compelled (in July 1763) to evacuate the fort, and make his way to Montreal. The conspiracy was crushed in 1766, Wisconsin was reopened for traders, and not only French but American merchants and travellers flocked into the region. Among these were Alexander Henry (1739-1824), who as early as 1760 had visited the site of Milwaukee, and who now obtained a monopoly of the Lake Superior trade, and Jonathan Carver (q.v.), who in 1766 reached Green Bay on his way to the Mississippi.

In 1774 was passed the Quebec Act for the government of the Province of Quebec into which the Wisconsin region was incorporated by this act, but it had little effect on the French trade; the British and French competed there as vigorously as before, and the word "Black Hawk" (for the Illinois) had already become the name of an Indian leader. In 1778 a trader of Prairie du Chien, acting as agent for George Rogers Clark, detached several western tribes from the British adherence, and personally led a band of French settlers to his aid. The close of the war, although it conveyed the region to the sovereignty of the United States, was not followed by American occupation. In this period, however, the fur-trade assumed proportions of greater importance, and trading posts were established by the North-west Company (Canadian). In 1786 a more systematic attempt was made to work the lead mines by Julien Dubuque, who obtained the privilege from the Indians. In 1787 Wisconsin became part of the North-west Territory, but it was not until after the ratification of Jay's treaty that in 1796 the western posts were evacuated by the British. Before the actual military occupation (1816) by the United States, American traders had begun to enter into a sharp rivalry for the Indian trade. In 1800 Wisconsin was included in the newly organized Indian Territory; and in 1809 on the admission of Indiana as a state it was attached to Illinois. During the second war with Great Britain, the Wisconsin Indians and French settlers generally sided with the British, and in 1814 many of them participated in Major William McKay's expedition against Fort Shelby at Prairie du Chien. In 1816 Fort Howard was built at Green Bay; and Fort Crawford at Prairie du Chien. In the same year was confirmed the treaty negotiated in 1804 by William Henry Harrison, by the terms of which the Indian title to the lead region was extinguished. In 1810 the product of lead had been about 400,000 lb., largely mined and smelted by Indians, but the output was now increased enormously by the American miners who introduced new machinery and new methods, and by 1820 there were several thousand miners in the region, including negro slaves who had been brought north by Southern prospectors from Kentucky and Missouri. In 1818 Illinois was admitted to the Union and Wisconsin was incorporated in Michigan Territory, and at that time American civil government in the Wisconsin region was first established on an orderly and permanent basis. Wisconsin then comprised two counties, Brown (east) and Crawford (west), with county seats at Green Bay and Prairie du Chien. Until 1830 the fur-trade, controlled largely by John Jacob Astor's American Fur Company, continued to be the predominating interest in the Wisconsin region, but then the growing lead mining industry began to overshadow the fur-trade, and in the mining region towns and smelting furnaces were rapidly built. Indian miners were soon driven out of business and were nearly crowded out of their homes. Friction between the settlers and the Indians could not long be avoided, and in 1827 Red Bird and his band of Winnebago attacked the whites, but after some bloodshed they were defeated by Major William Whistler (1780-1863) of Fort Howard. Five years later occurred a more serious revolt, the Black Hawk War (see Black Hawk), which also grew out of the dispute over the mineral lands.
The Black Hawk War not merely settled the Indian question so far as Wisconsin was concerned, but made the region better known, and gave an appreciable impetus to its growth. A series of Indian treaties in 1829, 1831, 1832 and 1833 extinguished the Indian titles and opened up to settlement a vast area of new land. The first newspaper, the Green Bay Intelligencer, began publication in 1833. In 1834, two land offices were opened, and by 1836, 878,014 acres of land had been sold to settlers and speculators. A special census showed a population of more than 11,000 in 1836. The new growth started a movement for a separate Territorial organization for that part of Michigan lying west of Lake Michigan, but this was not finally accomplished until 1836, when Michigan entered the Union. The new Territory of Wisconsin comprised not only the area included in the present state, but the present Iowa and Minnesota and a considerable portion of North and South Dakota. Henry Dodge (1782–1867) was appointed its first governor by President Jackson.

The first Territorial Council met in 1836 at Old Belmont, now Leslie, Lafayette county, but in December of that year Madison was selected as the capital, after a contest in which Fond du Lac, Milwaukee, Racine, Green Bay, Portage and other places were considered, and in which James Duane Doty, later governor, owner of the Madison town plat, was charged with bribing legislators with town lots in Madison. In 1838 the Territory of Iowa was erected out of all that part of Wisconsin lying west of the Mississippi. The movement for the admission of Wisconsin to the Union was taken up in earnest soon after 1840, and after several years' agitation, in which Governor Doty took a leading part, on the 10th of August 1846 an Enabling Act introduced in Congress by Morgan L. Martin, the Territorial delegate, received the approval of President Polk. Meanwhile the Territorial legislature had passed favourably on the matter, and in April the act was ratified by a popular vote of 12,334 to 2487.

The first constitution drafted was rejected (5th April 1847) owing to the articles relating to the rights of married women, exemptions, the elective judiciary, &c. A second convention, thought to be more conservative than the first, drafted another constitution, which on the 13th of March 1848 was adopted by 15,799 ayes and 6,004 noes. The constitution was approved by Congress and signed by the president on the 29th of May 1848; the first state election had already been held on the 8th of May, and Governor Nelson Dewey and other state officers were sworn into office on the 7th of June. In the same year the free public school system was established, and the great stream of German immigration set in. Railway construction began in 1851. Wisconsin was a strong anti-slavery state. In 1854 one of the first steps in the organization of the Republican party (q.v.) was taken at Ripon. In the same year a fugitive slave named Glover was seized at Racine and was afterward rescued by an anti-slavery mob from Milwaukee; the State Supreme Court rendered a decision which declared the Fugitive Slave Law to be null and void in Wisconsin.

In 1856 a contested election for the governorship between Governor William A. Barstow (1813–1865), a candidate for re-election, and his Republican opponent, Coles Bashford (1816–1878), threatened to result in civil war. But the courts threw out "supplementary returns" (possibly forged by the canvassers) and decided in favour of Bashford, who was the first Republican to hold an office; with two exceptions Wisconsin has elected Republican governors ever since. The state gave its electoral vote for Lincoln in 1860 and supported the administration during the Civil War. The policy of the state to keep its regiments full rather than send new regiments to the front made the strength of a Wisconsin regiment, according to General W. T. Sherman, frequently equal to a brigade. The whole number of troops furnished by Wisconsin during the war was 91,379. In January 1874 a Democratic Liberal Reform administration came into power in the state with William R. Taylor as governor. At the legislative session which followed, the Potter law, one of the first attempts to regulate railway rates, was passed. The railways determined to evade the law, but Taylor promptly brought suit in the State Supreme Court and an injunction was issued restraining the companies from disobedience. In 1876, however, the Republicans regained control of the state government and the law was modified. In 1880 the passage of the Bennett law, providing for the enforcement of the teaching of English in all public and parochial schools, had a wide political effect. The Germans, usually Republicans, roused for the defence of their schools, voted the Democratic state ticket at the next state election with the result that George Wilbur Peck, the Democratic nominee, was chosen governor by a narrow majority. The Bennett law was at once repealed, but not until 1895 did the Republicans regain control of the administration. It was accomplished then after a Democratic gerrymander had been twice overthrown in the courts. Since that time, however, the Republican party has grown more secure, and it has placed on the statute books a series of radical and progressive enactments in regard to railway rate legislation and taxation, publicity of campaign expenditures and a state-wide direct primary law (1907). In all these reforms a leading part was taken by Governor Robert M. La Follette (b. 1855), who was elected to the United States Senate in 1900. Opposition to his political programme resulted in a serious split in the Republican ranks, the opposition taking the old name of "Stalwarts" and his followers came to be known as "Halfbreeds." Governor La Follette, however, could draw enough support from the Democrats to maintain in the control of the state by the Republicans. Wisconsin had several times been visited by disastrous forest fires. One in the north-eastern counties (Oconto, Brown, Door, Shawano, Manitowoc and Kewaunee) in 1871 resulted in the loss of 150 lives and a vast amount of property.

\(^1\) Wisconsin, as the last state to be created wholly out of the old North-West Territory, was the loser in boundary disputes with neighboring states. As originally planned, Wisconsin would have included all of present Illinois and Michigan (including Lake Superior) to the north end of Lake Michigan, and the inhabitants of this tract actually voted to join Wisconsin, but Congress paid no attention to their demands, and this strip of land, including Chicago, became a part of Illinois. Wisconsin's present boundary was the result of the 1818 Treaty of Greenville (q.v.), to which Michigan for her losses to Ohio the northern peninsula, geographically a part of the Wisconsin region, was given to Michigan. Finally a larger tract of land N. E. of the Mississippi, which include St Paul, Duluth, and other territory, was given to Minnesota in 1858, and Wisconsin's present boundary was fixed.

\(^2\) Peck (b. 1840) was a printer and then a journalist, founded in 1873 at La Crosse the Sun, which in 1878 he removed to Milwaukee, and was the author of many humorous sketches, notably a series of volumes of which the hero is "Peck's Bad Boy."

\(^3\) Governor: succeeded Barstow, who resigned during a contest with Bashford.

\(^4\) Resigned to become a member of the United States Senate.

\(^5\) Lieut.-Governor: elected governor in 1900 and 1908.
BIBLIOGRAPHY.—For physical description and natural resources see the Reports (biennial and the Fourth Edition) of the State Geological and Natural History Survey, especially important for economic geology, hydrography and agriculture, and the Annual Reports of the Wisconsin State Board of Agriculture; the Reports (biennial) of the U.S. Census of Agriculture of the U.S. Census, and the Mineral Resources of the United States, published annually by the U.S. Geological Survey. A good school manual is E. C. Case's Wisconsin, its Resources and Geographic Position (Milwaukee, 1910), and the Birds of Illinois and Wisconsin (Nowell's Museum of Natural History, Publication No. 131 (Chicago, 1909), and L. Kammler and N. Hollister, "The Birds of Wisconsin," in vol. iii. (1908) of the Wisconsin Academy of Arts and Sciences). A list of works on the history of the state see D. S. Durrie's "Bibliography of Wisconsin" in vol. vii., new series, Historical Magazine. The society, R. G. Thwaites, Wisconsin, (Boston, 1908), in the "American Commonwealths" series. The same author's Story of Wisconsin (Ibid. 1890) in the "Story of the States" series, and H. E. Lesger's Leading Events in Wisconsin History (Milwaukee, 1898), a good brief summary, are other single-volume works covering the entire period of the state's history. One of the best accounts of the state's early history is E. H. Neville and D. B. Martin's Historic Green Bay (Green Bay, 1893). S. S. Ibbert's Wisconsin and its People (Madison, 1910) contains material of the earlier period written, however, before much recent material was brought to light. Much material of value is contained in the Historical Collections of Wisconsin, vol. i., sq. (Madison, 1854-59), the Historical Society of Wisconsin (1846; reorganized, 1849), and in the Bulletins of Information, Proceedings and Draper Series of the same society are many valuable historical papers and monographs. Several works on the history of the state, viz., History of the History of the State, 1836 by G. R. Parkman, The Parkman Society Papers (Milwaukee, 1895-1899) provide a collection of good articles on special topics of Wisconsin history, and the Original Narratives and Reprints published by the Wisconsin History Commission (created by an act of 1909) deal with Wisconsin in the Civil War. See also Auguste Gosselin, Jean Nicolet 1618-1642 (1893); B. A. Hinsdale, The Old North-West (New York, 1888); Chalmers Smith, A History of Wisconsin, rev. ed. (Chicago, 1893); and R. V. Phelan, Financial History of Wisconsin (Madison, 1908); F. J. Turner, Character and Influence of the Indian Tribe in Wisconsin, vol. ix. of Johns Hopkins University Studies (Baltimore, 1892); R. G. Parkman, The Jesuits in North America (Boston, 1870), and the volumes of the Jesuit Relations, edited by R. G. Thwaites.

WISCONSIN, UNIVERSITY OF, a coeducational institution of higher learning at Madison, Wisconsin, the capital of the state, established in 1848 under state control, established largely by the state, and a part of the state educational system. The university occupies apicturesque and beautiful site on an irregular tract (600 acres), including both wooded hills and undulating meadow lands, along the shores of Lake Mendota, The main building, University Hall (1854), enlarged several times, and 1905-1906), which crowns University Hill, is exactly 1 m. from the state capitol. The other buildings include North Hall (1850), South Hall (1854), Science Hall (1887), the Biology Building (1911), the Chemical Building (1904-1905), the Hydraulic Laboratory (1903), the Engineering Building (1900), the Law School (1804), Chadbourne Hall (1870; remodelled in 1896) for women, Lathrop Hall (1910) for women, Assembly Hall (1879), the Chemical Engineering Building (1883), Machine Shops (1883), the armoury and gymnasium (1894), a group of half a dozen buildings belonging to the Center of American Archaeology, the Washburn Observatory (1878; a gift of Governor C. C. Washburn). On the lower campus is the building of the Wisconsin State Historical Society.

The university includes a college of letters and science, with general courses in liberal arts and special courses in chemistry, commerce, education, engineering, homoeopathic medicine, law, medicine, mines, music, political science, veterinary science, and agriculture, a department of home economics, a dairy course and farmers' institutes; a college of law (3 years' course); a college of medicine, giving the first two years of a medical course; a graduate school of literature and science; and a department of agriculture, instruction by lectures, of correspondence study, of general information and welfare, and of debating and public discussion. There is a system of extension courses in Agriculture, business, home economics, and schools, instruction is offered to artisans and apprentices and in library training. The college of agriculture, one of the largest and best equipped in the country, provides also briefer courses of practical training for farmers and farmers' wives. In connection with the college of agriculture, instruction on the prevention and treatment of tuberculosis is provided, exhibits and instructors or demonstrators being sent to every part of the state. The state hygienic laboratory and the Wisconsin State Agricultural College are among the state's educational institutions. The Wisconsin State University is the forest products laboratory (1910) of the United States Department. At Milwaukee there is a university settlement associated with the social work of the university.

The university grants a commission or certificate from accredited high schools or academies. Tuition is free for residents of the state. Courses in the first two years are largely prescribed, but those in the three or four years are elective under a definite system. In 1910 there were 395 instructor and 497 student faculty members (men and women). The university library proper, of 163,000 volumes and 40,000 pamphlets, is housed in the Historical Society's building, in the Capitol. The state library also has the collections of the Historical Society and that of the Wisconsin Academy of Arts and Sciences—a total in 1910 of 404,000 books and 200,000 pamphlets.

The grounds, buildings and equipment of the university are valued at $2,000,000. The income of the university, including income from the Federal land grants, from invested productive funds and from state tax levies, exceeds one million dollars annually. Since 1905 the state legislature has appropriated for the current expenses of the university a $2,000,000. The total income of the university in 1910 was $2,000,000. The university is the property of the state, and the legislature has power to regulate the affairs of the university.

An act for the creation of a university to be supported by the Territory was passed by the first session of the Territorial legislature in 1836, but except for the naming of a board of trustees the plan was never put into operation. A similar act for the establishment of a university at Green Bay had no more result. In 1858 a university of the Territory of Wisconsin was created by act of the Territorial legislature and was endowed with two townships of land. This was the beginning of the state university, provision for which was made in the state constitution adopted in 1848. The university was incorporated by act of the legislature in that year with a board of regents as the governing body, chosen by the legislature. A preparatory department was opened in the autumn of that year, and John H. Lathrop (1799-1866), a graduate of Yale, then president of the university of Missouri, was chosen as the first chancellor of the new institution. He was inaugurated in 1859, and in that year North Hall, the first building, was erected. The first academic class graduated in 1854. In the same year the Federal Congress granted to the state seventy-two sections of salt-spring lands, and as no such lands were found in the state, had been petitioned to change the nature of the grant) granted seventy-two sections to be "sold in such manner as the legislature may direct for the benefit and in aid of the university." The Federal land grants, however, which ought to have supported the university, were sacrificed to a desire to attract immigrants, and the institution for many years was compelled to get along on a small margin which rendered extension difficult; and the university permanent fund was soon impaired for the construction of buildings. Henry Barnard in 1859 succeeded Lathrop as chancellor, but resigned in 1861. After the Civil War, the office of chancellor was displaced by that of president. Paul Ansel Chadbourne (1832-1883), a graduate (and afterwards president) of Williams College, became president in 1867, and in his presidency (1867-1870) the university was reorganized, a college of law was founded, co-education was established and the agricultural college was consolidated with the university, a radical departure from the plan adopted by the Territory. In 1871-1874 John Hanson Twombly, a graduate of Wesleyan University, and a member of the founders of Boston University, was president, and the legislature first provided for an annual state tax of $10,000 for the university. With the coming to the presidency (1874) of John Bascom (b. 1827), another graduate of Williams, the university began a new period of development; the preparatory department was

1. The university is now governed by regents, of whom two—the president of the university and the state superintendent of public instruction—are ex officio, and the others are appointed by the governor for terms of three years, two from the state at large and one from each congressional district.
It is not easy to determine whether the book is all from the same author. On the one hand, it may be said that one general theme—the salvation and final prosperity of the righteous—is visible throughout the work, that God is everywhere represented as the supreme moral governor of the world, and that the conception of immortality is found in both parts; the second part, though differing in form from the first, may be regarded as the historical illustration of the principles set forth in the latter.

Historical notes: The book is not a record, but an exposition, the primary object of which is to present the scheme of things in a plausible and consistent theory. The second part, which is often referred to as the historical part, is a continuation of the first, and the two parts are connected by a few key ideas.

It consists of a series of chapters in which the author develops his theory. The first part (chs. 1-22) is a general introduction, setting forth the author's conception of the universe and its purpose. The second part (chs. 23-49) is a detailed account of the events of the world, from its creation to the final triumph of the righteous.

The author uses a variety of literary devices, including allegory, parable, and myth, to explain his ideas. The book is written in a style that is both poetic and philosophical, and it is filled with vivid imagery and metaphors.

The book is not a history in the strict sense, but rather an attempt to give a coherent explanation of the world as it is, and to provide a vision of how it might be brought into line with the author's conception.

It has been compared to other works of literature, such as the Bible and the Iliad, and it has been studied by scholars in a variety of disciplines, including history, philosophy, and literature.

In conclusion, the book is a complex and intriguing work, and it continues to be studied and debated by scholars around the world.
WISDOM LITERATURE

misfortunes for the righteous—over against these things the possession of wisdom is declared to be the supreme good. The ethical standard of the book is high except in the bitterness displayed towards the "wicked," that is, the enemies of the Jews. The only occurrence in old Jewish literature (except in Exod. xiv. 2) of the word meaning "conscience" is found in xvii. 11 (wisdom): wickedness is timorous under the condemnation of conscience (the same thought in Prov. xxviii. 1). The book is absolutely monotheistic, and the character ascribed to the deity is ethically pure with the exception mentioned above.

The style shows that the book was written in Greek, though naturally it contains Hebraisms. The author of the first part was in all probability an Alexandrian Jew; nothing further is known of him; and this is true of the author of the second part, if that be a separate production. As to the date, the decided Greek colouring (the conception of wisdom, the list of Stoiic virtues, etc.), and the fact, that it is.xliii. regarded by Patristic and later authors, generally as inspired, it was by Patristic and later authors, probably as canonical by the council of Trent, but is not so regarded by Protestants.

WISDOM LITERATURE, the name applied to the body of Old Testament and Apocryphal writings that contain the philosophical thought of the later pre-Christian Judaism. Old Semitic philosophy was a science not of ontology in the modern sense of the word, but of practical life. For the Greeks, a "sage" involved inquiry into the basis and origin of things; the Hebrew "wisdom" was the capacity so to order life as to get out of it the greatest possible good. Though the early Hebrews (of the time before the 5th century B.C.) must have reflected on life, there is no trace of such reflection, of a systematic sort, in their extant literature. "Wis men" are distrusted and opposed by the prophets. The latter were concerned only with the maintenance of the sole worship of Yahweh and of social morality. This was the task of the early Hebrew thinkers, and to it a large part of the higher energy of the nation was devoted. The external law given, as was believed, by the God of Israel, was held to be the sufficient guide of life, and everything that looked like reliance on human wisdom was regarded as disloyalty to the Divine Lawgiver. While the priests developed the sacrificial ritual, it was the prophets that represented the theocratic element of the national life—they devoted themselves to their task with noteworthy persistency and ability, and their efforts were crowned with success; but their virtue of single-mindedness carried with it the defect of narrowness—they despised all peoples and all circumstances, and were actuated by a passion to win their fellow-countrymen, who were not wholly in accordance with their own principles.

The reports of the earlier wise men, men of practical sagacity in political and social affairs, have come to us from unfriendly sources; it is quite possible that among them were some who took interest in life for its own sake, and reflected on its human moral basis. But, if this was so, no record of their reflections has been preserved. The class of sages to whom we owe the Wisdom Books did not arise till a change had come over the national fortunes and life. The firm establishment of the doctrine of practical moral hebitus happened to coincide in time with the destruction of the national political life (in the 6th century B.C.).

At the moment when this doctrine had come to be generally accepted by the thinking part of the nation, the Jews found themselves dispersed among foreign communities, and from that time were a subject people environed by aliens, Babylonian, Persian and Greek. The prophetic office ceased to exist when its work was done, and part of the intellectual energy of the people was thus set free for other tasks than the establishment of theistic dogma. The ritual law was substantially completed by the end of the 5th century B.C.; it became the object of scientific study; thus was the basis of the second conception of the future of the life (see Perke Aboth). The social unification produced by the conquests of Alexander brought the Jews into intimate relations with Greek thought. It may be inferred from Ben-Sira's statements (Ecclus. xxxix. 1-11) that it was the custom for scholars to travel abroad and, like the scholars of medieval Europe, to increase their knowledge by personal association with wise men throughout the world. Jews seem to have entered eagerly into the larger intellectual life of the last three centuries before the beginning of our era. For some the influence of this association was of a general nature, merely modifying their conception of the moral life; others adopted to a greater or less extent some of the peculiar ideas of the current systems of philosophy. Scholars were held in honour in those days by princes and people, and Ben-Sira frankly adds this fact as one of the great advantages of the pursuit of wisdom. It was in cities that the study of life and philosophy was best carried on, and it is chiefly with city life that Jewish wisdom deals.

The extant writings of the Jewish sages are contained in the books of Job, Proverbs, Psalms, Ben-Sira, Tobit, Ecclesiastes, Lamentations, Wisdom, Sirach, and the Apocrypha. The first chapter of Pirke Aboth (a Talmudic tract giving, probably, pre-Christian material). Of these Job, Ps. xi., Ixxxii., xcxii. 6-8 (5-7), Eccles., Wisdom, are discussions of the moral government of the world; Prov. Ps. xxxvii., xcx., Ben-Sira, Tob. iv., xii.-xii. 11-11, Pirke, are manuals of conduct, and 4th Maccab. treats of the autonomy of reason in the moral life; Ps. viii., xcx.-2 (0), xcx.-3, xcv.-12, cvii.-12, cxcx-, cxcxv., cxcvi., c., cxcvi. 8 are reflections on man and physical nature (cf. the Yahweh addresses in Job, and Ecclus. xiii.-xliii. 3). Sceptical views are expressed in Job, Prov. xxx. 2-4 (Agur), Eccles.; the rest take the current orthodox position.

Though the intellectual world of the sages is different from that of the prophetical and legal Hebraism, they do not break with the fundamental Jewish theistic and ethical creeds. Their monothelitism remains Semitic—even in their conception of the cosmicogic and illuminating function of Wisdom they regard God as standing outside the world of physical nature and man, and do not grasp or accept the idea of the identity of the human and the divine; there is thus a sharp distinction between their general theistic position and that of Greek philosophy. They retain the old high standard of morals, and the first distinction among the sages is the division into the "wise" who set their thoughts on enemies (Prov. xx. 11) and to do no man what is hateful to one's self (Tob. iv. 15); in these finer maxims they doubtless represent the general ethical advance of the time.

This comes to a head in the writings of the rabbis in practically ignoring the physical supernatural—that is, they regard the miracles of the ancient times (referred to particularly in Wisdom xvi.-xx.), as the product of the plastic imagination, or the justification of the life of their own time. Angels occur only in Job and Tobit, and there in noteworthy characters: in Job they are beings whom God charges with folly (v. 18), or they are meditators between God and man
WISE, H. A.—WISE, I. M.

(v. 1, xxxii. 23), that is, they are humanized, and the Elohim beings (Gen. xxi. 22; Prov. viii. 22) are spiritualized out of the figure of Satan being used by the author to account for Job's calamities; in Tobit the "affable" Raphael is a clever man of the world. Except in Wisdom ii. 24 (where the serpent of Gen. iii. is called the kontakt to it as an element of paganism (Avic. i., in Tob. iii. 8, 17), and that a Persian figure. Job alone introduces the mythical dragons (iii. 8, 12, 13, xxvi. 12) that occur in later Jewish thought. In the later development of the Wisdom books, it is the freindliest to supernatural machinery.

Like the prophetic writings before Ezekiel, the Wisdom books, while they recognize the sacrificial ritual as an existing custom, attach no importance to it as an element of religion (Avic. iii., fullest mention of it is in Eccles. xxxiv. 4 fl.), the difference between prophets and sages is that the former do not regard the ritual as of divine appointment (Jer. vii. 22) and oppose it as nonsensical and monstrous. 

(And) most stress on the universal side of religion, lose sight of its local and mechanical side (see Eccles. xxxiv. 1-3). Their broad culture (reinforced by the fact that they are) comparatively indifferent to Messianic hopes and to the conception of a final judgment of the nations that was closely connected with these hopes: a Messiah is not mentioned in their writings (not in Prov. xvi. 10-15), and a final judgment only in Wisdom of Solomon, where it is not of nations but of individuals. In this regard a comparison between them and Daniel, Enoch and Psalms of Solomon is instructive. Their interest is in the ethical relations between man and earth.

There was nothing in their general position to make them hospitable to ethical conceptions of the future life, as is shown by the fact that Ezekiel with the idea of immortality, which made itself felt in Jewish circles it was adopted by the author of the Wisdom of Solomon; but prior to the 1st century B.C. it does not appear in the Wisdom literature, and the nationalistic dogma of resurrection of the faithful seems never to have anywhere in the Wisdom of Solomon, the Underworld is the old Hebrew abode of all the dead, and therefore a negligible quantity for the moralist. Nor do the prophets point to any particular future life. They have no philosophical discussion of the basis of the moral life; their standard of good conduct is existing law and custom; their motive for right-doing is individual eudaemonistic, not a religious one. This indifference towards a future life of their own sake, but advantage for one's self. They do not attempt a psychological explanation of the origin of human sin; bad thought is evil (see Eccles. xxxvi. 3) is accepted as a fact, or its entrance into the world is viewed as due to the entrance of the serpent (Wisd. iv. 17) and the breaking in by the devil (Job xxxviii. 28; Prov. 1. 7; Eccles. xxv. i fl.) and even with the Jewish law (Eccles. xxiv. 23). But in such passages it remains fundamentally human; no attempt is made to define the limits of the human and the divine in its composition—it is all explained. In fine, they eschew theories and confine themselves to visible facts.

It is in keeping with their whole point of view that they claim no divine inspiration for themselves; they speak with authority, but their authority is that of reason and conscience. It is this definitely rational tone that constitutes the difference of the teaching of the social philosopher and the moralist. It is the whole of the philosophy, the whole of the wisdom is regarded as the result that approves or condemns conduct (job. Eccles. xiv. 2: or i. 15, Wisd. Sol. xvii. 11). Wisdom is represented as the result of human reflection, and thus as the true guide of life. The same takes place in the later conception, as divine (in Wisd. ofSol. and in parts of Prov. and Eccles. but not in Eccles.), in accordance with the Hebrew view, which regards all human conduct as determined by the fear of God. Wisdom, as identified in the fear of God (Job xxviii. 28; Prov. i. 7; Eccles. xxv. i fl.) and even with the Jewish law (Eccles. xxiv. 23). But in such passages it remains fundamentally human; no attempt is made to define the limits of the human and the divine in its composition—it is all explained. In fine, they eschew theories and confine themselves to visible facts.

he conceived the idea of a union, and after a campaign lasting a quarter of a century the Union of American Hebrew Congrega-
tions was founded (1873) in Cincinnati. As a corollary of this he founded in 1875 the "Hebrew Union College" in the same city, and this institution has since trained a large number of the rabbis of America. Wise also organized various general assemblies of rabbis, and in 1880 established the Central Con-
ference of American Rabbis. He was the first to introduce family pews in synagogues, and in many other ways "occidental-
ized Jewish worship.

See D. Philip, The Reform Movement in Judaism (1907). (J.A.)

WISEMAN, NICHOLAS PATRICK STEPHEN (1802-1865), English cardinal, was born at Seville on the 2nd of August 1802, the child of Anglo-Irish parents recently settled in Spain for business purposes. On his father's death in 1805 he was brought to Waterford, and in 1810 he was sent to Ushaw College, near Durham, where he was educated until the age of sixteen, when he proceeded to the English College in Rome, reopened in 1818 after having been closed by the Revolution for twenty years. He graduated doctor of theology with distinction in 1825, and was ordained priest in the following year. He was appointed vicar at Ushaw College in 1828, and became Bishop of Trim and Dunbrody when not yet twenty-six years of age. This office he held until 1840. From the first a devoted student and antiquary, he devoted much time to the examination of oriental MSS. in the Vatican library, and a first volume, entitled Horae Syriacae, published in 1827, gave promise of a great scholar. Leo XII. apppointed him curator of the Arabic MSS. in the Vatican, and professor of oriental languages in the Roman university. At this date he had close relations, personal and by correspondence, with Mai, Bunsen, Burgess (bishop of Salisbury), Tholuck and Kluge. His student life was, however, broken by the pope's command to preach to the English in Rome; and a course of his lectures, On the Connexion between Science and Revealed Religion, deservedly attracted much attention, his general thesis being that whereas scientific teaching has repeatedly been thought to disprove Christian doctrine, further investigation has shown that a reconstruction is possible. He visited England in 1835-
36, and delivered lectures on the principles and main doctrines of Roman Catholicism in the Sardinian Chapel, Lincoln's Inn Fields, and in the church at Moorfields, now pulled down. Their effect was considerable; and after Pusey's request Newman reviewed them in the British Critic (December 1836), treating them for the most part with sympathy as a triumph over popular Protestantism. To another critic, who had taken occasion to point out the resemblance between Catholic and pagan cere-
monies, Wiseman replied, boldly admitting the likeness, and maintaining that it could be shown equally well to exist between Christian and heathen doctrines. In 1836 he founded the Dublin Review, partly to infuse into the lethargic English Catholics higher ideals of their own religion and some enthusiasm for the papacy, and partly to enable him to deal with the progress of the Oxford Movement, in which he was keenly interested. At this date he was already distinguished as an accomplished scholar and critic, able to converse fluently in half-a-dozen languages, and well informed on most questions of scientific, artistic or antiquarian interest. In the winter of 1838 he was visited in Rome by Macaulay, Manning and Gladstone. An article by him on the Donatist schism appearing in the Dublin Review in July 1839 made a great impression in Oxford, Newman and others seeing the force of the analogy between Donatists and Anglicans. Some words he quoted from St Augustine influenced Newman pro-
foundly: "Quapropter securus judicat orbis terrarum bonos non esse qui se dividunt ab orbe terrarum." And preaching at the opening of St Mary's church, Derby, in the same year, he anticipated Newman's argument on religious development, published six years later. In 1840 he was consecrated bishop, and sent to England as coadjutor to Bishop Walsh, vicar-apostolic of the Central district, and was also appointed president of Oscott College near Birmingham. Oscott, under his presidency, became a centre for English Catholics, where he was also visited by many distinguished men, including foreigners and non-Catholics. The Oxford converts (1845 and later) added considerably to Wis-
man's responsibilities, as many of them found themselves wholly without means, while the old Catholic body looked on the newcomers with distrust. It was by his advice that Newman and his companions spent some time in Rome before undertaking clerical work in England. Shortly after the accession of Pius IX. Wiseman was appointed temporarily vicar-apostolic of the London district, the appointment becoming permanent in February 1849. On his arrival from Rome in 1847 he acted as informal diplomatic envoy from the pope, to ascertain from the government what support England was likely to give in carrying out the historic policy with which Pius inaugurated his reign. In response Lord Minto was sent to Rome as "an authentic organ of the British Government," but the policy in question proved abortive. Residing in London in Golden Square, Wiseman threw himself into his new duties with many-sided activity, working especially for the reclamation of Catholic criminals and for the restoration of the lapsed poor to the practice of their religion. He was zealous for the establishment of religious communities, both of men and women, and for the holding of retreats and missions. He preached (4th July 1849) at the first Catholic mass in the Temple Church, London, since the time of the Reformation. He also founded the Catholic Mission in England since the Reformation, 14 bishops and 240 priests being present, and six religious orders of men being represented. The progress of Catholicism was undeniable, but yet Wiseman found himself steadily opposed by a minority among his own clergy, who disdained his Ultramontane ideas, his "Romanizing and in-
novating zeal," especially in regard to the introduction of sacred images into the churches and the use of devotions to the Blessed Virgin and the Blessed Sacrament, hitherto unknown among English Catholics. In July 1850 he heard of the pope's intention to create him a cardinal, and he took this to mean that he was to be permanently recalled to Rome. But on his arrival there he ascertained that a part of the pope's plan for restoring a diocesan hierarchy in England was that he himself should return to England as cardinal and archbishop of Westminster. The papal brief establishing the hierarchy was dated 29th September 1850, and on 7th October Wiseman wrote a pastoral, dated "from out of the Flaminian Gate"--a form diplomatically correct, but of bombastic tone for Protestant ears--in which he spoke enthusiastically, if also a little pompously, of the "restoration of Catholic England to its orbit in the ecclesiastical firmament." Wiseman travelled slowly to England, round by Vienna; and when he reached London (11th November) the whole country was ablaze with indignation at the "papal aggression," which was misunderstood to imply a new and unjustifiable claim to territorial rule. Some indeed feared that his life was endangered by the violence of popular feeling. But Wiseman displayed calmness and courage, and immediately penned an admirable Appeal to the English People (a pamphlet of over 30 pages), in which he explained the nature of the pope's action, and argued that the admitted principle of toleration included leave to establish a diocesan hierarchy; and in his con-
cluding paragraphs he effectively contrasted that domination over Westminster, which he was taunted with claiming, with his duties towards the poor Catholics resident there, with which alone he was really concerned. A course of lectures at St George's, Southwark, further moderated the storm. In July 1852 he pre-
-sided at Oscott over the first provincial synod of Westminster, at which Newman preached his sermon on the "Second Spring"; and at this date Wiseman's dream of the rapid conversion of England to the ancient faith seemed not incapable of realization. But many difficulties with his own people shortly beset his path, due largely to the suspicions aroused by his evident preference for the ardent Roman zeal of the converts, and especially of Manning, to the dull and cautious formalism of the old Catholics. The year 1854 was marked by his presence in Rome at the definition of the dogma of the immaculate conception of the Blessed Virgin (8th December), and by the publication of his historical romance, Fabiola, a tale of the Church of the Cata-
combs, which had a very wide circulation and was translated into ten languages. In 1855 Wiseman applied for a coadjutor, and
George Errington, bishop of Plymouth, his friend since boyhood, was appointed, with the title of archbishop of Trebizond. Two years later Manning was appointed provost of Westminster and he established in Bayswater his community of the "Oblates of St Charles." All Wiseman's later years were darkened by Errington's conscientious but implacable hostility to Manning and to himself in so far as he was supposed to be acting under Manning's influence. The story of the estrangement, which was largely a matter of temperament, is fully told in Ward's biography. Ultimately, in July 1860, Errington was deprived by the pope of his coadjutorship with right of succession, and he retired to Prior Park, near Bath, where he died in 1886. In the summer of 1858 Wiseman paid a visit to Ireland, where, as a cardinal of Irish race, he was received with enthusiasm. His speeches, sermons and lectures, delivered during his tour, were printed in a volume of 300 pages, and show an extraordinary power of rising to the occasion and of speaking with sympathy and tact. Wiseman was able to use considerable influence with English politicians, partly because in his day English Catholics were wavering in their historical allegiance to the Liberal party. As the director of votes thus doubtful, he was in a position to secure concessions that bettered the position of Catholics in regard to poor schools, reformatory and workhouses, and in the status of their army chaplains. In 1863, addressing the Catholic Congress at Malines, he stated that since 1830 the number of priests in England had increased from 1,454 to 1,444, and of converts of women from 16 to 162, while there were 15 religious houses of charity to Manning's none in 1836. The last two years of his life were troubled by illness and by controversies in which he found himself, under Manning's influence, compelled to adopt a policy less liberal than that which had been his in earlier years. Thus he had to condemn the Association for the Promotion of the Unity of Christians, with which he had shown some sympathy in its inception in 1857; and to forbid Catholic parents to send their sons to Oxford or Cambridge, though at an earlier date he had hoped (with Newman) that at Oxford at least a college or hall might be assigned to them. But in other respects his last years were cheered by marks of general regard and admiration, in which non-Catholics joined; and after his death (16th February 1866) there was an extraordinary demonstration of popular respect as his body was taken from St Mary's, Moorfields, to the cemetery at Kensal Green, where it was intended that it should rest only until a more fitting place could be found in a Roman Catholic cathedral church of Westminster. On the 30th of January 1907 the body was removed with great ceremony from Kensal Green and reburied in the crypt of the new cathedral, where it lies beneath a Gothic altar tomb, with a recumbent effigy of the archbishop in full pontificals.

Wiseman was undoubtedly an eminent Englishman, and one of the most learned men of his time. He was the friend and correspondent of many foreigners of distinction, among whom may be named Döllinger, Lamennais, Montalembert and Napoleon III was a writer he was apt to be turgid and prolix, and there was a somewhat un-English element of ostentation in his manner. But his accomplishments and ability were such as would have secured for him influence and prominence in any age of the Church; and besides being highly gifted intellectually and morally, he was marked by those specially human qualities which command the interest and admiration of all and enhance them. He combined with the principles known as Ultramontanism to little liberalization in matters ecclesiastical. He insisted on a poetical interpretation of the Church's liturgy; and while strenuously maintaining her Divine communion to teach faith and morals, he regarded the Church as in other respects a learner: and he advocated a policy of conciliation with the world, and an alliance with the best tendencies of contemporary thought. It was, in his judgment, quite in accordance with the Catholic Church's interest to constantly assimilate all that is worthy in the civilization around.

suggested that account must be taken of the "verschiedene Lagerung ihrer Atome im Atom." Later (see Die räumliche Anordnung der Atome in organischen Molekül, 1887) he extended the application of the van't Hoff-Le Bel theory, believing that it, together with the supposition that there are "specially directed forces, the affinity-energies," which determine the relative position of atoms in the molecule, afforded a method by which the spatial arrangement of atoms in particular cases may be ascertained by experiment. Wislicenus is also known for his work on aceto-acetic ester and its application as a synthetical agent. He was awarded the Davy medal by the Royal Society in 1868.

Wismar, a sestop to Hamburg, in the Grand Duchy of Mecklenburg-Schwerin, situated on the Bay of Wismar, is one of the best harbours on the Baltic, 20 m. by rail N. of Schwerin. Pop. (1905) 21,902. The town is well and regularly built, with broad and straight streets, and contains numerous handsome and quaint buildings in the Northern Gothic style. The church of St Mary, a Gothic edifice of the 13th and 14th centuries, with a tower 260 ft. high, and the church of St Nicholas (1381-1460), with very lofty vaulting, are regarded as good examples of the influence exercised in these Northern provinces by the large church of St Mary in Lübeck. The elegant hall of the town, of 14th and 15th centuries. The Fürstenhof, at one time a ducal residence, but now occupied by the municipal authorities, is a richly decorated specimen of the Italian early Renaissance style. Built in 1525-1562, it was restored in 1872-1879. The "Old School," dating from about 1300, has been restored, and is now occupied as a museum. The town hall (rebuilt in 1820) contains a collection of pictures. Among the manufactures of Wismar are iron, machinery, paper, roofing-felt and asphalt. There is a considerable trade, especially by sea, the exports including grain, oil-seeds and butter, and the imports coal, timber and iron. The harbour is deep enough to admet vessels of 17-f. draught, and permits large steamers to unload along its quays. Two miles from Wismar lies the watering-place of Wendorf.

Wismar is said to have received civic rights in 1220, and came into the possession of Mecklenburg in 1301. In the 13th and 14th centuries it was a flourishing Hanse town, with important woollen factories. Though a plague carried off 10,000 of the inhabitants in 1376, the town seems to have remained tolerably prosperous until the 16th century. By the peace of Westphalia in 1648 it passed to Sweden, with a lordship to which it gives its name. In 1803 Sweden pledged both town and lordship to Mecklenburg for 1,258,000 thalers, reserving, however, the right of redemption after 100 years. In view of this contingent right of Sweden, Wismar was not represented in the diet of Mecklenburg until 1857. In 1903 Sweden finally renounced its claims. Wismar still retains a few relics of its old liberties, including the right to fly its own flag.

See Burmeister, Beschreibung von Wismar (Wismar, 1857); Willgeroth, Geschichte der Stadt Wismar, pt. I. (Wismar, 1868); and Bruno Schmidt, Der Schleswig-meklenburgische Pfandvertrag über Stadt und Herrschaft Wismar (Leipzig, 1901).

Witan, or Witnecmot (from O. Eng. wita, pl. witan, a wise man, and gemōl, a meeting, from O. Eng. meeting, to meet), the national council in Anglo-Saxon times. Its origin is obscure. There is some resemblance between it and the two assemblies mentioned by Tacitus in the Germania, a larger and a smaller one, but this analogy must not be pressed too far. In Anglo-Saxon England in the 7th and 8th centuries it seems certain that each of the larger kingdoms, Kent, Wessex, Mercia and Northumbria, had its separate witan, or council, but there is no evidence as to whether it was identical with, or distinct from, the folk-moot, in which, theoretically at least, all freemen had the right to appear. H. R. von Gneist (History of the English Constitution) agrees that the two assemblies were identical, and a somewhat similar view is put forward by J. M. Kemble (Saxons in England) and E. A. Freeman (History of the Norman Conquest). Freeman advances the theory that the right of all the freemen to attend the gemōl had for practical purposes fallen into disuse, and thus the assembly had come to be confined to the wise men. In other words, the folk-moot had become the witan. Evidence in support of this view is sought for in the accounts in the Anglo-Saxon Chronicle and elsewhere, where the decisions of the witan were received with loud expressions of approval or of disapproval by an assembled crowd, and it is argued that this is a survival from an earlier age, when all the freemen attended the witan. But the attendance of the crowd can be otherwise explained. The meetings referred to were probably those of exceptional interest, such as the election or the coronation of a king, and people from the neighbourhood were there merely as interested, and sometimes excited, spectators. The view is also put forward that the two assemblies were distinct, is held, although with characteristic acerbity by Stubbs (Const. Hist. vol. 1). He thinks that on the union of the kingdoms the witan were merged into one another, while the folk-moot became the shiremoot. As the number of kings decreased the number of witan decreased, until early in the 9th century there was one king and one witan in all England.

The power of the witan varied according to the personality of the reigning king, being considerable under a weak rulcr, but inconsiderable under a strong one. Generally speaking, it diminished as the years went by, and from a necessary minister, two archbishops, seven bishops, eight reeves, it gradually disappeared. Its duties are shown by the preamble to the laws of Ine, king of Wessex, and 200 years later by the preamble to those of Alfred the Great, while several similar cases could be instanced. Ine legislates "with the counsel and with the teaching of Cenred my father and of Hedde my bishop, and of Eorcenwald my bishop, with all mv ealdormen and the most distinguished witan of my people" (Stubbs, Select Charters), and Alfred issues his code of laws "with the counsel and consent of his witan." Thus the members of the witan were primarily counselors. With their consent the king promulgated laws, made grants of land, appointed bishops and ealdormen, and discharged the other duties of government. The witan was also a court of justice, Earl Godwine and many other offenders receiving sentence of outlawry therein. Its members had the power of electing a new king, although the area of their choice was strictly limited by custom and also the right of deposing a king, although this seems to have been infrequently exercised.

Its members signed the charters by which the king conveyed grants of land to churches and to individuals, and it is from the extant charters that we mainly derive our knowledge about the composition of the witan. It consisted, in addition to the king, his sons and other relatives, of the bishops and later some abbots, of some under-kings and the ealdormen of the shires or provinces, and of a number of ministris, or king's thegn. These ministris were nominees of the king; they included the important members of his household, and their number gradually increased until it outstripped that of all the other members. The witan appears probably to have had no fixed place of meeting, and to have assembled around the person of the king, wherever he might be. In the later years of its existence, at least, it met three times a year at Easter, Whitsuntide and Christmas. The number of counsellors attending the meetings of the witan varied considerably from time to time. "In a witenagemot held at Luton in November A.D. 931 were the two archbishops, two Welsh princes, seventeen bishops, fifteen ealdormen, five abbots and fifty-nine ministris. In another, that of Winchester of A.D. 934, were present the two archbishops, four Welsh kings, seventeen bishops, four abbots, twelve ealdormen and fifty-two ministris. These are perhaps the fullest extant lists. Of Edgar's witenagemots, the one of A.D. 966 contained the king's archbishop, seven "merlye atte ealdormen," and was attended by fifteen ministris; and this is a fair specimen of the usual proportion" (Stubbs, Const. Hist. ch. vi. Almost immediately after the Norman Conquest the word fell into disuse.

WITCH and WIZARD. These two words are now generally used of an adept of the black art, a sorcerer, magician, female
and male respectively (see Magic and Witchcraft). "Witch," formerly of common gender, represents O. Eng. wīca (masc.), wīce (fem.), agent-nouns to wician, to practise sorcery, probably a causative verb from O. Eng. wican, to give way (cf. "weak"), and therefore signifying to avert (evil), conjure away. So Norweg. vijka means (1) to turn aside, (2) to exercise. The participial "wicked" means witch-like. "Wizard" is formed from "with" and the slightly contemptuous Anglo-French suffix -ard, as in drunkard, laggard, sluggard, &c.

WITCH BROOMS, or "Birds' Nests," in botany, peculiar broom-like growths often seen on the branches of many trees. They are a dense development of branching twigs formed at one place on a branch as the result of the irritation set up by the presence of a mitre or a fungus.

Witchcraft, a term often used of magical practices of all sorts, but here confined to the malevolently ("black") magic of women. It should, however, be noted that the male witch occasionally appears in folklore, while "white witchcraft" is common; the practices of the witch of Endor are akin rather to spiritualism than witchcraft. The German term hexe was not originally applied to human beings at all, but to child-devouring demons, corresponding to the Roman lamia; and it is used in this sense till the 14th century, it does not appear in literature in its present sense till some time in the 15th century.

The modern European conception of the witch is perhaps the result of the fusion of several originally discrete ideas. In some countries we find the distinction made between conjurers, witches and sorcerers; the former were supposed to raise the devil by means of spells and force him to do their will; the witch proceeded by way of friendly pact with an evil spirit; a third class produced strange effects, without the aid of spirits (see Magic), by means of images or forms of words. We also find a distinction drawn between diviners, mathematici (=astrologers), crystal-gazers, necromancers and others; but it must be remembered that our knowledge for the earlier period is rather of learned ideas than of the actual popular beliefs, and for the later period of the popular belief sophisticated by ecclesiastical subtleties. In present-day belief the witch is, like the savage magician, initiated by another or himself performs ceremonies believed to give her magical powers. She possesses a familiar (see Lycanthropy; Magic), whose form she can assume; she can ride through the air in some cases and is equally adept at all kinds of magic.

Sir A. C. Lyall maintains that the witch is a person who works magic by her own powers, not by the aid and counsel of supernatural beings; but this view, though it may be true of poisoning and similar features formerly reckoned a part of witchcraft, does not apply to the European witch. Witchcraft and possession are found in clusters of magical means, and psychical epidemics of the middle ages, but are otherwise unrelated.

Witchcraft among Primitive Peoples.—Although magical powers are everywhere attributed to women, witchcraft as here defined is by no means universal; in Europe alone is the woman the almost exclusive repository of magical powers; in the Congo the muntu ndongo may be either a man or a woman, and in fact the sexes are said to be engaged in magical pursuits in approximately equal numbers; in Australia men are much more concerned with magic than women, but the latter have certain forms peculiar to themselves in the central area, and, as in medieval Europe, to the womanly concern with sexual matters. At the present day the European witch is almost invariably old, but this is not characteristic of the female magician of primitive peoples, or not to the same extent; it must be remembered that the modern idea of witchcraft is largely a learned product—the result of scholastic and inquisitorial ingenuity, mingled to a greater or less extent with genuine folk beliefs. In India, among the Agarias of Bengal, the instruction in witchcraft is given by the old women; but the pupils are young girls. The Indian witch is believed to have a cat familiar; there, as in Europe, many toxic elements (f) are applied to witches; they may be thrown into water, or their identity discovered by various forms of divination; or they may be known by the fact that beating them with the castor oil plant makes them cry out. As a punishment the witch may be shaved, made to drink dirty water, or otherwise ill-used.

Witchcraft in Classical Times.—Our knowledge of witchcraft in pagan antiquity is slight, but Horace has left us an elaborate description of the proceedings of two witches in the Esquiline cemetery. At the new moon they steal into it for greater boli and nocturns here, their feet bare, their hair loose and their robes tucked up. So far from aiming at secrecy, however, they alarm their neighbours with their cries. Making a hollow in the ground they rend a black lamb over it to summon the devil. Then taking two images, one of wool representing a witch, one of wax representing the man whose infidelity she wishes to punish, a witch performs magical ceremonies; the moon turns red, hell hounds and snakes glide over the spot. Then they bury the muzzle of a wolf and burn the waxen image; as it melts, so fades the life of its prototype. In Greece Thessalian women had the reputation of being specially endowed with folk beliefs; their poisons were famous and they were said to be able to make the moon descend from the sky.

Medieval Witchcraft.—We know less of early and medieval witchcraft than of modern savage and popular beliefs; our knowledge of it is drawn partly from secular sources—the laws against, and in later times the trials for the offence—partly from ecclesiastical sources; but in each case the popular creed is filtered through the mind of a writer who did not necessarily understand or share the belief. For the earlier period we have penitentials, decisions of councils, discussions as to the bonds and branches of witchcraft, as to their exact relation to the sin of heresy or as to the mechanism by which the supposed results were achieved; at a later period the trials of witches before the Inquisition are of great importance; but the beliefs of this period must be sharply distinguished from those of the earlier one. Finally we have a great mass of material in the secular trials of the 15th and 20th following centuries.

There are marked differences in the character of the witchcraft beliefs of different countries, due perhaps in part to the influence of the Inquisition, which reacted on the popular conceptions, in part to real differences in the original folk beliefs. In northern countries the witches' Sabbath never seems to assume any importance; in Germany, in the form of the Brocken assembly on May Eve, it is a prominent feature, and in England we may bring it into relation with the belief that at certain periods of the year demons and spirits are abroad and have special powers; in south Europe the idea of the Sabbath seems to owe much of its prominence to the association of witchcraft with heresy and the assemblies of the Waldenses and others. Again, the "evil eye" (g.v.) is especially associated with the south of Europe; and the "lizard," (personification of witchcraft, as to its exact relation to the sin of heresy or as to the mechanism by which the supposed results were achieved; at a later period the trials of witches before the Inquisition are of great importance; but the beliefs of this period must be sharply distinguished from those of the earlier one. Finally we have a great mass of material in the secular trials of the 15th and 20th following centuries.

...
For the church witchcraft was a canonical sin, or superstition; for the civil law it was a violation of the civil rights of others, so far as real results were produced. Consequently we find the legal distinction between the maleficia and the striga is equally marked. The Frankish and Alemannic laws of A.D. 500-600 five years later the Inquisition regarded the latter as mere superstition.

For the church witchcraft was a canonical sin, or superstition; for the civil law it was a violation of the civil rights of others, so far as real results were produced. Consequently we find the legal distinction between the maleficia and the striga is equally marked. The Frankish and Alemannic laws of A.D. 500-600 five years later the Inquisition regarded the latter as mere superstition. The Lex Salica indeed punished the striga as a murderess, but only exacted wergeld. Rothar forbade judges to kill the striga, and Charlemagne even punished the belief in them. The Alemanni (A.D. 600) forbade private torture of women suspected of witchcraft or sorcery. But although witchcraft was criminal, and we find occasional laws against sortiae (Westfranks, A.D. 873), or expulsions (from Pomerania, 1124, &c.), in this period the crime is unimportant save where maleficia is combined with treason and the person of the king is aimed at.

From Development: In the second period (1230-1430) we have to deal with two factors of fundamental importance: (1) the elaboration of demonology and allied ideas by the scholastics, and (2) the institution of the Inquisition to deal with the rising flood of heresy. At the beginning of this era the prevalent view of the striga seems to have been that she really existed; Caesar of Heisterbach (c. 1225) recognizes the female monster, who kills children; William of Paris (c. 1230) agrees that lamiae and strigae eat children, but they are allied to the dominæ nocturnae; that they are real women is a foolish belief. Scholastic ingenuity, however, soon disposed of rationalistic objections to this as a flight from the truths taken for granted in the period before 800. This intrusion of the incubus in the domain of witchcraft was probably due to the attitude of the church towards magic.

Ecclesiastical and Civil Law.—For the attitude of the church to witchcraft there are three factors to be considered: (1) the Biblical recognition of its reality; (2) the universal belief in demons and magic; and (3) the identification of these demons with heathen deities. The orthodox view fluctuates between the theory that witchcraft is idolatry, a recognition of real powers, and that it is disobedience, a superstitious following of non-existent deities.

The Biblical conception of witch is a person who deals with familiar spirits (Lev. xx. 20), and the express provision that a witch should not be suffered to live (Ex. xxii. 18) could have left no doubt that the crime was a real one in the Mosaic law. Although the familiar plays but a small part in this early period, we find that the church early came to the conclusion that witchcraft depended on a compact with demons; in the synod of Elvira (A.D. 306) it was pronounced to be one of the three canonical sins—apostasy—and punished by the refusal of communion, even on the death-bed. Augustine lays down (c. 178) that the sorcerer, or one who fosters the art of magic, is a devil; Augustine the presbyter, or one who sacrifices to the devil; at Worms in A.D. 829 the Frankish bishops declared that the devil sided both sexes to prepare love potions, to cause storms and to abstract milk, fruits of the field, &c.

It must not, however, be supposed that all kinds of witchcraft were equally recognized. The innumeris tempestatum and the poisoners by magical means were commonly recognized as real; but the striga was usually regarded as a pure superstition. An Irish synod (c. A.D. 800) pronounces a Christian to be anathema, who ventures to believe in the possibility of flight through the air and blood-sucking; Stephen of Hungary (907-12) wisely distinguishes the maleficia from the striga; Regino of Prüm (c. 906) concludes that the flight by night with the devil and the goddess Diana is a delusion, the work of the devil. Burchard of Worms (d. 1025) prescribes two years' penance for the belief that the Unholde kills Christians, cook them and eat their hearts, which they replace by a piece of wood, and then wake them. Agobard and others even express doubts as to the reality of weather-making. For those who took this view, and even for others who, like John of Damascus, accepted the striga, a mild attitude, in strict accordance with the days, was the accepted policy. The Synod of Relash (799) demands penance for witchcraft, but no punishment in this life. John of Damascus, Agobard, John of Salisbury and Burchard are equally mild.

distinct ideas and the crystallization of our modern idea of witch. To the methods of the inquisitors must be ascribed in great part the spread of these conceptions amongst the people; for the *Malleus Maleficarum* or Inquisitor's Manual (1486), following closely on the important bull *Summis desiderantes affectibus* (Innocent VIII., 1484), gave them a handbook from which they worked. In South were to extract such confessions as they desired; by a strange perversion these admissions, wrung from their victims by rack or thumb-screw, were described as voluntary.

The subsequent history of witchcraft may be treated in less detail. In England the trials were most numerous in the 17th century; but the absence of judicial torture made the cases proportionately less numerous than they were on the European continent. One of the most famous witch-finders was Matthew Hopkins, himself hanged for witchcraft after a career of some three years. Many of his methods were not far removed from actual torture; he pricked the body of the witch to find anaesthetic areas; other signs were the inability to shed tears, or repeat the Lord's Prayer, the practice of walking backwards or against the sun, throwing the hair loose, intertwining the fingers, &c. Witches were also weighed against the Bible, or thrown into water, the thumbs and toes tied crosswise, and those who did not sink were adjudged guilty; a very common practice was to shave the witch, perhaps to discover insensible spots, but more probably because originally the familiar spirit was supposed to cling to the place where the last English trial for witchcraft was held, when Jane Wenham was convicted, but not executed. Occasional cases of lynching continue to occur, even at the present day.

In Scotland trials, accompanied by torture, were very frequent in the 17th century. A famous witch-finder was Kincaid. The last trial and execution took place in 1722.

In New England there was a remarkable outburst of fanaticism—the famous Salem witchcraft delusion—in 1692—1693; but many of the prisoners were not convicted and some of the convicts received the governor's pardon (see *Salem, Mass.*). On the continent of Europe the beginning of the 16th century saw the trial of witchcraft cases taken out of the hands of the Inquisition in France and Germany, and the influence of the *Malleus* became predominant in those countries. Among famous continental trials may be mentioned that of a woman named Voisin in 1680, who was burnt alive for poisoning, in conjunction with the Marquise de Brinvilliers. Trials and executions did not finally cease till the end of the 18th century. In Spain a woman was burnt in 1781 at Seville by the Inquisition, the secular courts condemned a girl to decapitation in 1782; in Germany, in the 18th century, there were several instances; in America and Mexico witch-burning seems to have lasted till well into the second half of the 19th century, the latest instance apparently being in 1885 in Peru.

The total number of victims of the witch persecutions is variously estimated at from 100,000 to several millions. If it is true that Benedict Czarnpov (1550—1666) passed sentence on 20,000 victims, the former figure is undoubtedly too low.

**Rise of the Critical Spirit.**—It is commonly assumed and has been asserted by Lecky that the historical evidence for witchcraft is too scattered and of too little authority to be of importance in testing the belief in witchcraft. But the testimony of the occurrence of marvels is small in quantity, if we except the valueless declaration of the victims of torture; testimony as to the pathological side of witchcraft is abundant, and affords no proof of the erroneous inferences drawn from the genuine phenomena. If this uncritical attitude is found in our own day, it is not surprising that the rationalistic spirit was long in making its appearance and slow in gaining the victory over superstition. From the 15th century onwards the old view that transformation and transportation were not realities but delusions, caused directly by the devil, began to gather force. Among the important works may be mentioned Johann Weier's *De Practicis Daemonum* (1563), Reginald Scott's (c. 1538—1590) *Discovery of Witchcraft* (1584) which was ordered to be burnt by King James I., who had himself replied to it in his *Daemonologie* (1597), Balthasar Bekker's *Betoverde Wereld* (1601), which, though it went farther in the direction of scepticism, had less influence than Friedrich v. Spee's *Cautio Criminalis* (1631). In France Jean Uvier defended the rationalistic view, and Jean Bodin demanded that he should be sent to the stake for his heresy.

**Psychology of Witchcraft.**—Although at the height of the witch persecution torture wrung from innocent victims valueless confessions which are at best evidence that long-continued agony of body may be instrumental in provoking hallucinations, there can be no doubt that witches commonly, like the magician in lower planes of culture, firmly believe in their own powers, and the causes of this seem to be not merely subjective. (1) Ignorance of the effects of suggestion leads both the witch and others to regard as supernormal effects which are really due to the victim's belief in the possibility of witchcraft. This applies especially to cases of "ligature." (2) Telepathy (q.v.) seems in some cases to play a part in establishing the witch's reputation; some evidence has been produced that hypnotism at a distance is possible, and an account of her powers given by a French witch to Dr Gibotteau suggests that this element cannot be neglected in appraising the evidence for witchcraft. (3) Whatever be the real explanation of the belief in poltergeists (q.v.) and "physical phenomena" (q.v.), the belief in them rests on a very different basis from that of the belief in lycanthropy; exaggeration and credulity at times very serious and manifestly associated with witchcraft. On the other hand, subjective causes played their part in causing the witch to believe in herself. (4) Auto-suggestion may produce hallucinations and delusions in otherwise sane subjects; and for those who do not question the reality of witchcraft this must operate powerfully. (5) The descriptions of witches show that in many cases their sanity was more than questionable; trance and hysteria also played their part. (6) It is uncertain to what extent drugs and salves have helped to cause hallucinations; but that they had some share seems certain, though modern experimenters have failed to throw down the physics of the Fifteen, sixteenth century drugs; here too, however, the effects of suggestion must be reckoned with; we do not associate the use of tobacco with hallucinations, but it was employed to produce them in Haiti in the same way as hemlock among the Bantu of the present day. (7) Hallucinations occurring under torture must have tended to convince bystanders and victims alike, no less than the acceptance of suggestions, positive and negative.

As regards the nature of the ideas accepted as a result of suggestion or auto-suggestion, they were on the one hand derived, from the 15th century onwards, from occult sources, and from folk beliefs; but beneath these elements is a stratum of popular belief, derived in the main perhaps from pagan sources, for to this day in Italy witchcraft is known as *la vecchia religione,* and has been handed down in an unbroken tradition for countless generations.

WITCH-HAZEL

Bastian,Der Mensch in der Geschichte. On witchcraft and insanity, see Hack-Tuke, History of Insanity; O. Snell, Hexenprocesse und Geistereragen. The discussion on evidence for the vice of witchcraft, see E. Gurney, Phantasmata, vol. 1; F. Podmore, Modern Spiritualism, l. 13.

WITCH-HAZEL, in botany, the common name for a North American shrub, Hamamelis virginica, known in gardens. The clusters of rich yellow flowers begin to expand in the autumn before the leaves turn yellow and continue, without the leaves, through winter. Bark and leaves are astringent, and the seeds contain a quantity of oil and are edible. The name is derived from the use of the twigs as divining rods, just as hazel twigs were used in England.

Britain and Holland (Dictionary of English Plant Names, p. 247) quote three British plants under this name: (1) Wych elm (Ulmus montana), which, according to Parkinson (Theatr. 1629), was called "Witch hazel" because the leaves were like unripe hazel leaves; (2) Hornbeam (Carpinus Betulus), which, according to Gerard, was so called in some places from its likeness to the elm or "sich Hasell tree"; and (3) Mountain ash (Pyras aucuparia).

Witch of Agnesi, in geometry, a cubic curve invented by Maria Gaetana Agnesi. It is constructed by the following method: Let AQB be a semicircle of diameter AB, produce MQ the ordinate of Q to P so that MQ : MP = AM : AB. Then the locus of P is the witch. The cartesian equation, if A be taken as origin and AB (=a) for the axis of x, is

\[ y^2 = a^2(1 - x) \]

The curve consists of one branch entirely to the left of the line x = a and having the axis of y as an asymptote. It is therefore an interesting curiosity of art, and the remains of a fortification formed as a result of the use of Edward the Elder in 913, but perhaps of British origin.

Wither, George (1588-1667), English poet and satirist, son of George Wither of Hampshire, was born at Bentworth, near Alton, on the 11th of June 1588. He was sent to Magdalen College, Oxford, at the age of fifteen, and remained at the university for two years. His neighbours appear to have had no great opinion of him, for they advised his father to put him to some honest trade. He was, however, given over to the Inns of Chancery, eventually obtaining an introduction at court. He wrote an elegy (1612) on the death of Prince Henry, and a volume of gratulatory poems (1613) on the marriage of the princess Elizabeth, but his uncompromising character soon prepared trouble for him. In 1611 he published Abuses Stript and Whipt, twenty satires of general application directed against Revenge, Ambition, Lust and other abstractions. The volume included a poem called "The Scourge," in which the lord chancellor was attacked, and a series of epigrams. No copy of this edition is known, and it was not very popular, but in 1613 five editions appeared, and the author was lodged in the Marshalsea prison. The influence of the Princess Elizabeth, supported by a loyal "Satyre" to the king, in which he hints that an enemy at court had fitted personal meanings to his general invective, secured his release at the end of a few months. He had figured as one of the interlocutors, "Rogge," in his friend William Browne's Shepherd's Pipe, with which were bound up eclogues by other poets, among them one by Wither, and during his imprisonment he wrote what may be regarded as a continuation of Browne's work, The Shepherd's Hunting (printed 1615), eclogues in which the two poets appear as "Wille" and "Roget" (in later editions "Philarote"). The fourth of these eclogues contains a famous passage in praise of poetry. After his release he was admitted (1615) to Lincoln's Inn, and in the same year he printed privately Fidelia, a love elegy, of which there is a unique copy in the Bodleian. Other editions of this book, which contained the lyric "Shall I, wasting in despair," appeared in 1617 and 1619. In 1621 he returned to the satiric vein with Wither's Motto, Nec habeo, nec caro, nec curro. Over 30,000 copies of this poem were sold, according to his own account, within a few months. Like his earlier invective, it was said to be libellous, and Wither was again imprisoned, but shortly afterwards released without formal trial on the plea that the book had been duly licensed. In 1622 appeared his Faire-Virtue, The Mistress of Phil' Arte, a long panegyric of a mistress, partly real, partly allegorical, written chiefly in the seven-syllabled verse of which he was a master. Wither began as a moderate in politics and religion, but from this time his Puritan leanings became more and more pronounced, and his later work consists of religious poetry, and of controversial and political tracts. His Hymnes and Songs of the Church (1622-1623) were issued under a patent of King James I, ordaining that they should be bound up with every copy of the authorized metrical psalms offered for sale (see HYMNS). This patent was opposed, as inconsistent with their privilege to print the "singing-psalms," by the Stationers' Company, to Wither's great mortification and loss, and a second similar patent was finally disallowed by the House of Lords. Wither was in London during the plague of 1625, and in 1628 published Britain's Remembrancer, a voluminous poem on the subject, interspersed with denunciations of the wickedness of the times, and prophecies of the disasters about to fall upon England. He also incidentally attacked the work of John Donne, author of The Eponymous Chronicler, in a poem called Time Vindicated, by a reference to Ben's "drunken concave." This book he was obliged to print with his own hand in consequence of his quarrel with the Stationers' Company. In 1635 he was employed by Henry Taunton, a London publisher, to write English verses illustrative of the allegorical plates of Crispin van Passo, originally designed for Gabriel Rolleghen's Nucleus emblematorum selectissimum (1610-1613). This book was published as a Collection of Emblems, Ancient and Modern, or perhaps the only extant copy known is in the British Museum. The best of Wither's religious poetry is contained in Hecateckle, or Britain's Second Remembrancer, which was printed in Holland in 1641. Many of the poems rise to a high point of excellence. Besides those properly entitled to the designation of hymns, the book contains songs of singular beauty, especially the Cradle-song ("Sleep, baby, sleep, what ails my dear "), the Anniversary Marriage Song ("Lord, living here are we "), the Perambulation Song ("Lord, it hath pleased Thee to say "), the Song for Lovers ("Come, sweet heart, come, let us prove "), the Song for the Happily Married ("Sleep they in singing take delight ") and the Song for the Poor ("Now to the world it will appear "). (Nos. 50 in the first part, 17 and 24 in the second, and 20, 27 and 41 in the third). There is also in the second part a fine song (No. 59), full of historical as well as poetical interest, upon the evil times in which the poet lived, beginning—

"Now are the times, these are the days
Which will those men approve
Who take delight in honest ways
And pious courses love;
Now to the world it will appear
That innocence of heart
Will keep us far more free from fear
Than helmet, shield or dart."

Wither wrote, generally, in a pure nervous English idiom, and preferred the reputation of "rusticity" (an epithet applied to him even by Baxter) to the tricks and artifices of poetical style which were then in favour. It may be partly on that account that he was better appreciated by posterity than by his contemporaries.

Wither had served as captain of horse in 1629 in the expedition of Charles I against the Scottish Covenanters, and his religious rather than his political convictions must be accepted as the explanation of the fact that, three years after the Scottish expedition, at the outbreak of the Great Rebellion, he is found definitely siding with the parliament. He sold his estate to raise a troop of horse, and was placed by a parliamentary committee in command of Farnham Castle. After a few days' occupation he left the place undefended, and marched to London. His own
house near Farnham was plundered, and he himself was captured by a troop of Royalist horse, owing his life to the intervention of Sir John Denham on the ground that so long as Withers lived he himself could not be accounted the worst poet in England. After this episode he was promoted to the rank of major. He was present at the siege of Gloucester (1643) and at Naseby (1645). He had been deprived in 1643 of his nominal command, and of his commission as justice of the peace, in consequence of an attack upon Sir Richard Onslow, who was, he maintained, responsible for the Farnham disaster. In the same year parliament made him a grant of £2000 for the loss of his property, but he apparently never received the full amount, and complained from time to time of his embarrassments and of the slight rewards he received for his services. An order was made to settle a yearly income of £150 on Withers, chargeable on Sir John Denham's sequestered estate, but there is no evidence that he ever received it. A small place given him by the Protector was forfeited "by declaring unto him (Cromwell) those truths which he was not willing to hear of." At the Restoration he was arrested, and remained in prison for three years. He died in London on the 2nd of May 1667.

His extant writings, catalogued in Park's British Bibliographer, number over a hundred. Sir S. E. Brydges published The Shepherd's Hunting (1814), Fidelia (1815) and Fair Virtue (1818), and a selection among his companion Poets, vol. i. and ii. (1828). Most of Wither's works were edited in twenty volumes for the Spenser Society (1871-1882); a selection was included by Henry Morley in his Companion Poets (1891); Fidelia and Fair Virtue are included in Dr. Granger's Eng. Poets, vol. xii. (1892-1893), and an excellent edition of The Poetry of George Wither was edited by F. Sidgwick in 1902. Among A. C. Swinburne's Miscellanies there is an amusing account of a copy of a selection from Wither's poems annotated by Lamb, then by Dr. Nott, whose notes were the subject of further ruthless comment from Lamb.

WITHERITE, a mineral consisting of barium carbonate (BaCO₃), crystallizing in the orthorhombic system. The crystals are invariably twinned together in groups of three, giving rise to pseudo-hexagonal forms somewhat resembling bipyramidal crystals of quartz, the faces are usually rough and striated horizontally. The colour is dull white or sometimes greyish, the hardness is 3½ and the specific gravity 4.3. The mineral is named after W. Withering, who in 1784 recognized it to be chemically distinct from barytes. It occurs in veins of lead ore at Hexham in Northumberland, Alston in Cumberland, Anglezark, near Chorley in Lancashire, and a few other localities. Witherite is readily altered to barium sulphate by the action of water containing calcium sulphate in solution, and crystals are therefore frequently encrusted with barytes. It is the chief source of barium salts, and is mined in considerable amounts in Northumberland. It is used for the preparation of rat poison, in the manufacture of glass and porcelain, and formerly for refining sugar.

WITHERSPoon, John (1723-1794), Scottish-American divine and educationalist, was born at Gifford, Yester parish, East Lothian, Scotland, on the 5th of February 1722/1723, the son of a minister of the Scotch Established Church, James Witherspoon (d. 1759), and a descendant on the distaff side from John Welch and John Knox. He studied at Haddington, and graduated in 1739 at the university of Edinburgh, where he completed a divinity course in 1743. He was licensed to preach by the Haddington presbytery in 1743, and after two years as a probationer in Scotland's (1745) minister of the parish of Belsay. His Ecclesiastical Characteristics (1753), Serious Apology (1764), and History of a Corporation of Servants discovered a few years ago in the Interior Parts of South America (1765), attacked various abuses in the church and satirized the "moderate" party. In 1757 he had become pastor at Paisley; and in 1760 he received the degree of D.D. from Aberdeen. He was sued for libel for printing a rebuke to some of his parishioners who had beset the sacrament of the Lord's Supper; and after several years in the courts he was ordered to pay damages of £150, which was never paid by his parishioners. He refused calls to churches in Dublin and Rotterdam, and in 1766 declined an invitation brought him by Richard Stockton to go to America as president of the College of New Jersey (now Princeton University); but he accepted a second invitation and left Paisley in May 1768. His close relation with the Scotch Church secured important material assistance for the college of which he now became president, and he toured New England to collect contributions. He secured an excellent set of scientific apparatus and improved the instruction in the natural sciences; he introduced courses in Hebrew and French about 1772; and he did a large part of the actual teaching, having courses in languages, divinity, moral philosophy, and elocution. In the American Presbyterian church he was a prominent figure; he worked for union with the Congregationalists and with the Dutch Reformed body; and at the synod of 1786 he was one of the committee which reported in favour of the formation of a General Assembly and which drafted "a system of general rules for... government." In politics he did much to influence Irish and Scotch-Irish Presbyterians to support the Whig party. He was a member of the provincial congress which met at New Brunswick in July 1774; presided over the Somerset county committee of corre- scns, were edited by Dr. Ashiel Green (New York, 1774-1775). The New Jersey constitutional convention in the spring of 1776, and from June 1776 to the autumn of 1779 and in 1780-1783 he was a member of the Continental Congress, where he urged the adoption of the Declaration of Independence, being the only clergyman to sign it. He became a member of the secret committee of corre-

WITNESS (from O. Eng. witnes; to know), in law, a person who is able from his knowledge or experience to make statements relevant to matters of fact in dispute in a court of justice: the relevancy and probative effect of the statements which he makes belong to the law of evidence (q.v.). In the present article it is only proposed to deal with matters concerning the position of the witness himself. In England, in the earlier stages of the common law, the jurors seem to have been the witnesses, for they were originally chosen for their knowledge or presumed knowledge of the facts in dispute, and they could (and can) be challenged and excluded from the jury if related to the parties or otherwise likely to have bias (q.v.). The jurors' oath contains the words "and no truth conceal," an obvious survival from the time when a juror was a witness.

Modern views as to the persons competent to give evidence are very different from those of Roman law and the systems derived from it. In Roman law the law of manumissions was not admissible without the application of torture, and a large body of possible witnesses was excluded for reasons which have now ceased to be considered expedient, and witnesses were excluded by the rules which became known as the Garner (vol. iv., 1882; vol. v., 1883), and another, nor could slaves against their masters, nor those at enmity with the party against whom their evidence was offered. Women and slaves could not act as witnesses at all, and if there were slaves who were free, seven witnesses were necessary for a will, five for a manumission, or to determine the question whether a person were free or a slave. As under the Mosaic law, two witnesses were necessary as a minimum number to prove any fact. Untis
responso testis omnino non audiatur are the words of a constitution of
Constantinople. The evidence of a single witness was simply semi-
plena probatio, to be supplemented. In default of that, evidence of a second witness was generally equivalent to that of two ordinary witnesses. The
evidence of the pope and that of a witness who simply proved baptism or heresy (according to some authorities) are perhaps the only non-peculiar exceptions to this rule.

The evidence of a witness was probably that of someone who was
considered an appropriate or neutral party to the case. It is probable that the incompetence of Jews as witnesses was never admitted by the Roman law as to competence, but extended the disabilities to excommuni-
cated persons and to a layman in a criminal charge against a cleric, unless by some exceptional rule. The exception is made in the case of the ancient testimony of the Law and the late commentators. The late commentaries of the Law, which were generally taken in the sense of the parables on the gospels. But in England until their expulsion they were in the status of slaves (captivi) of the king. A policy similar to that of Roman law was followed for centuries in England by excluding all persons interested, except for a witness for a prisoner, and of infamous persons, such as those who had been
attainted or had been vanquished in the trial by battle, or had stood in the pillory. All these were said to come non habere. In the
days of trial by battle a party could render a witness against a
him incompetent by challenging and defeating him in the judicial combat. Women were generally regarded as wholly or partially incompetent. English law had also certain rules as to the number of witnesses necessary. Thus under a statute of 1383 (6 Rich. II. st. 2, c. 5) the number of compurgators necessary to free an accused person from complicity in the peacot revolt was fixed at three or four. Five persons are necessary to prove ingratitude to the lord. In one instance in old Scots law the number of witnesses had the curious effect of determining the pavement of justices of the peace by a simple majority. The
evidence which was undergone by the accused on the oaths of three witnesses; if
to them the oaths of three seniores were added, the penalty was
immediate hanging.

The rule of the gradual development of the law of evidence, which is in a sense peculiar to the English system, the fetters of the Roman rules as to witnesses were gradually shaken off. In civil cases all disabilities by interest, relationship, sex or crime have been peremptorily rejected. The witness need not be present in the
sense, and objections which in Roman law went to his competence, in English law go to his credibility. The only general test of compentence is that provided by the rules. It extends to children and children of tender years; a person convicted of perjury is said to be competent if convicted at common law, but incompetent if convicted under the act of Elizabeth. No trial ever takes place
now under this act, and on this point the act seems to have been virtually repealed by Lord Denman's Act (1843; 6 & 7 Vict. c. 85).

The disqualification is not absolute as to lunatics; as to children it
is sometimes made to depend on whether they are able to understand
the nature of the witness's oath. And in certain cases within the
Criminal Law Amendment Act 1885 and the Prevention of Cruelty
to Children Act 1904, the unworn evidence of children of tender years is admissible.

Non-judicial witnesses are those who attest an act of unusual
importance, for the due execution of which evidence may afterwards be required. They are either made necessary by law, as the witnesses to bills of sale or quit-rents, as the witnesses to deeds. In some cases the attestation has become a mere form, such as the attestation of the lord chancellor to a writ of summons (see B. & T. 32.2).

The rule of English law as to the number of witnesses necessary is expressed in the phrase testes pendorantur non numenatur. But
there are certain exceptions, all statutory. Two witnesses are
necessary to make a will, two parties are required to be present at
a marriage and to attest the entry in the marriage register; in
the case of blasphemy, perjury, personation and most forms of treason, two or more witnesses are necessary to justify conviction.

Witnesses to bills of sale under the Bills of Sale Act 1882, and
witnesses on a charge of personation at elections, are required to be
credible. And in the case of dishonour of a foreign bill of ex-
change, the civil and military military postal, a person who has been bound in bond or manslaughter from the law merchant or a concession to continental practice. A warrant of attorney must be attested by a solicitor, and certain conveyances of property held on charitable uses must be attested by a solicitor or a conveyancer. The evidence of a witness is not sufficient unless corroborated in some material particular—not necessarily by another witness—e.g. in actions of
brandy, perjury, or defamation, or in actions for death from an injury caused by a misdeal or mismanagement of a mechanical or
manual cause, or when unsworn evidence of children is admissible.

In practice, but not in strict law, the evidence of an accomplice is required to be corroborated.

The test of the rule in theory has never permitted examination
by torture—unless certain forms of cross-examination can be
so described. In trials in the court of admiralty the Roman system
was adopted until 1752 (Henry VIII. c. 15). Torture in Scotland was abolished at the Union.

1 The provisions of the Marriage Act 1832 appear to be directory.
2 The giving of evidence unsworn appears to have been at one
time regarded as a privilege. The men of Ripon, for instance, were
by a charter of Athelstan be believed on their yea and nay in all
disputes.
WITNEY

761

Witnesses are also privileged from making disclosure of matters known to them in the following cases: (1) Public officers, as to matters coming within their official cognizance if they can swear that it is inconsistent with the public service to disclose them. This applies to state secrets, and extends to journals as to what passed between them, and the public prosecutor; and the police on this ground refuse to disclose the sources of information leading to indictments for the breach of the peace. (2) Medical practitioners, in matters concerning their clients, unless the communications are in themselves part of a criminal or unlawful enterprise. English law declines to extend professional privilege to communications between doctor and patient or lawyer and client, as between the most European countries, and in many British colonies, medical privilege is recognized as to matters communicated to the doctor or even discovered by him in attending the patient, but in Catholic countries confessions to a priest are stern. In England it is not now the practice to insist on evidence by a minister of religion as to matters confessed to him as such. (3) Communications between husband and wife during the marriage, are also privileged, at least so far as they are not derived from documentary evidence preserved by modern legislation (1853, c. 83, s. 3; 1868, c. 36, s. 1, r.d.).

It is correlative to the obligation of a witness to testify that no action may be brought against him under English law for any false statement made by him in the course of his testimony in judicial proceedings (Seaman v. Netherfield, 1871, 1 C.P.D. 540; Hudson v. Parn, 1910, 1 B.C.R. 458). If the statement is deliberately false, it is to prosecute him for perjury.

1 In ecclesiastical courts the punishment was by excommunication.

On charges of treason lists of the witnesses to be called by the crown must be supplied to the accused. In ordinary indictable cases there is no such obligation, but the names of the witnesses for the crown are written on the back of the indictment; and where the charges are not yet not ascertainable, the prosecution may now established practice to require notice to the accused of their names, and a précis of what they will be called to prove. In Scotland the practice is to give the accused (the panel) (1887, c. 35), and the same rule is observed in France. In the United States the same course is adopted where a capital offence is charged.

The rules as to competence of witnesses have been made substantially the same as in England by modern legislation (1837, c. 37, s. 9; 1840, c. 59, s. 1; 1852, c. 27; 1874, c. 64). Their attendance is procured by citation. Witnesses to produce documents are also allowed.

The evidence of witnesses is taken on oath (in the Scots form) or affirmation. Their privileges are substantially the same as in England, but they may be used for irrelevant defamatory statements volunteered during their evidence, the law of Scotland on this point being the same as under the Dutch Roman law (see Nathan, Common Law of S. Africa, § 1593).

British Possessions.—In India the law as to witnesses and evidence is consolidated in the Indian Evidence Act 1872, which contains in code form the substance of the English law on the subject. The test of competency is understanding: "all persons shall be competent witnesses unless the judge shall be of opinion that, from the nature of the questions put to them or from giving rational answers to these questions by tender years, extreme old age, disease of mind, or any other cause, they are incapable of giving rational answers" (s. 120). Under the Indian Oaths Act (x. of 1873) Hindus or Mahomedans or persons objecting to make an oath may affirm (s. 6). The court may accept an oath or solemn affirmation in any form common amongst or held by any persons of the persuasion or religion to which the witness belongs, unless it is repugnant to justice or decency (s. 8). In the rest of the British empire the laws of evidence are in many cases different. Evidence in the United States, however, is less uniform, for the law as to evidence is quite different in the federal and the states, and even in the states of the same class, the law being different in the different states. There are as many systems of law in the United States as there are states, which put them in a different class. In the larger states the law is not uniform in all the states. While slavery was lawful, the evidence of slaves (and in some states that of free persons of colour) was not received for or against whites. These rules appear to have been absolute until the 14th amendment to the Federal Constitution, and the laws of Delaware and Nebraska discriminate against free persons of colour. Incompetency by compulsion is the rule in the United States. (See 1 U.S. Stat. § 5392 and in those of a few states (see Wigmore, p. 654 n.).

European Countries. In the law of most European states the Roman law as to the competency and examination of witnesses is more closely followed than in countries whose law is based on that of England. In criminal cases the prisoner is not only competent but necessary, and the whole system of procedure is inquisitorial. Beginning with interrogation of the accused, not by the state prosecutor, but by the president of the court. In view of this system it is not surprising that the English conception of the rules of proof of evidence has been repugnant under the continental system the person who puts the questions is the person who has to determine their relevance. In France consanguinity and affinity to the party disqualify a witness in civil cases. He is also asked whether he is employer or servant of the parties (Code Civil, Proc. 262, 268). In criminal cases a like inquiry is made. Consanguinity and affinity in the case of lunatics may be a ground of disqualification if the objection is taken, as it may also in the case of lunatics, with pecuniary interest in the penalty (Code d’intr. Crim. 75, 322). Husband and wife cannot testify for or against each other even after divorce (ib.). In France disability to be a witness may be inferred as to a witness of the same crime with the accused in the penal, art. 42).

(W. F. C.)

WITNEY, a market town in the Woodstock parliamentary division of Oxfordshire, England, on the River Windrush, a tributary of the Thames, 73 m. S.W. of London on the Great Gloucestershire branch of the Great Western railway. Pop. of urban district (1901) 3574. The urban district was extended in 1808 to include portions of the scattered villages of Halley and
Curbridge. Witney is the seat of an old-established industry in blanket-making, and gloves and other woollen goods are also made. The broad main street contains several picturesque houses of the 17th century and later, and in it stands the Butter Cross, supported on columns and dating from 1683. The grammar school was founded in 1683, and a Blue Coat School in 1723. The great church of St Mary is one of the finest in the county. It is cruciform with a lofty central tower and spire, the latter considered to be a direct development of the early spire of the cathedral at Oxford. The tower is Early English, but the church exhibits the other styles, including a remarkable Norman porch. At Cogges, in the water-meadows bordering the river immediately below Witney, a considerable area was surveyed in the 13th century by Frederic of Fécamp, and of this there are Early English remains in the vicarage, while the church is mainly Decorated. The foundation, however, dates from the 11th century.

The manor of Witney (Wytnyne, Wytny, Witney) was held by the see of Winchester before the Conquest. It was sold in 1649, but was given back to the bishopric at the Restoration. In the middle of the 18th century it was leased by the bishop of Winchester to the duke of Marlborough. Witney was a borough by prescription at least as early as 1278, and sent representatives to Parliament several times, or regularly from 1304 to 1327. The government was by the steward and bailiffs of the bishop of Winchester, assisted by constables, wardmen and other officers. A woollen industry was probably established at an early date, for there is reference to a fulling mill in a charter of King Edgar dated 909. In 1641 the blanket-makers petitioned the crown against vexatious trade regulations; in 1673 the town is described as "driving a good trade for blankets and rugs." In 1711 the blanket-makers obtained a charter making them into a company, consisting of a master, assistants, two wardens and a constable. In 1731 the bishop of Winchester received a grant of a five days' fair at Witney at the feast of St Leonard. In 1728 the bishop was declared to have at Witney a weekly market on Thursday and two fairs on the day of Ascension and on St Leonard's day. A further grant of two yearly fairs was made in 1741 to the bishop of Winchester at his manor of Witney, namely, on the vigil and day of St Clement the Pope, and at the feast of St Barnabas.

WITOWT, or WIÓŁD (1350-1430), grand-duke of Lithuania, son of Kiejstut, prince of Samogitia, first appears prominently in 1382, when the Teutonic Order set him up as a candidate for the throne of Lithuania in opposition to his cousin Jagiello (see Wladislaus), who had treacherously murdered Witowt's father and seized his estates. Witowt, however, convinced himself that the German knights were far more dangerous than his Lithuanian rival; he accepted pacific overtures from Jagiello and became his ally. When Jagiello ascended the throne of Poland as Wladislaus II. in 1386, Witowt was at first content, with the principality of Grodno; but jealousy of Skirgiello, one of Jagiello's brothers, to whom Jagiello committed the government of Lithuania, induced Witowt to ally himself once more with the Teutonic Order (treaty of Königsberg, 24th of May 1390). He strengthened his position by giving his daughter Sophia in marriage to Vasily, grand-duke of Muscovy; but he never felt secure beneath the wing of the Teutonic Order, and when Jagiello removed Skirgiello from the government of Lithuania and offered it to Witowt, the compact of Ostrow (3rd of August 1392) settled all differences between them. Nevertheless, subsequent attempts on the part of Poland to subordinate Lithuania drove Witowt for the third time into the arms of the Order, and by the treaty of Salin in 1398, Witowt, who now styled himself Supremus Dux Lituanorum, even went so far as to cede his ancestral province of Samogitia to the knights, and to form an alliance with them for the conquest and partition of Pskov and Great Novgorod. His ambition and self-confidence at this period knew no bounds. He nourished the grandiose idea of driving out the hordes of Tamerlane, freeing all Russia from the Tatar yoke, and proclaiming himself emperor of the

North and East. This dream of empire was dissipated by his terrible defeat of the Lower Danier by the Tatarams on the 17th of August 1399. He was now convinced that the true policy of Lithuania was the closest possible alliance with Poland. A union between the two countries was effected at Vilna on the 18th of January 1401, and was confirmed and extended by subsequent treaties. Witowt was to reign over Lithuania as an independent grand-duke, but the two states were to be indissolubly united by a common policy. The result was a whole series of wars with the Teutonic Order, which now acknowledged Skirgiello, another brother of Jagiello, as grand-duke of Lithuania; and though Skirgiello was defeated and driven from the country by Witowt at the battle of Grunewald, the Hussite invasion, and the barbarous methods of "converting," the wretched inhabitants finally induced Witowt to rescue his fellow-countrymen at any cost from the tender mercies of the knights. In the beginning of 1409 he concluded a treaty with Jagiello at Novogrudok for the purpose, and on the 9th of July 1410 the combined Polish-Lithuanian forces, reinforced by Hussite auxiliaries, crossed the Prussien border. The rival forces encountered at Grunewald, or Tannenberg, and there on the 14th or 15th of July 1410 was fought one of the decisive battles of the world, for the destruction of the Order, which, after four centuries of existence, was for once totally crushed. They never recovered. After this battle Poland-Lithuania began to be regarded in the west as a great power, and Witowt stood in high favour with the Roman curia. In 1425, instigated by the emperor Sigismund, whom he magnificently entertained at his court at Lutsk, Witowt revived his claim to a kingly crown, and Jagiello reluctantly consented to his cousin's coronation; but before it could be accomplished Witowt died at Troki, on the 27th of October 1430. He was certainly the most imposing personality of his day in eastern Europe, and his martial valor was combined with statesmanlike foresight.

WITSIUS, HERMANN (1636-1708), Dutch theologian, was born at Enkhuysen, North Holland, and studied at Gröningen, Leiden and Utrecht. He was ordained to the ministry, becoming pastor at Westwood in 1656 and afterwards at Wormeren, where he became rector and dean, and Leuvenaard, and became professor of divinity successively at Freiberg and Utrecht (1680-1683). In 1698 he went to Leiden as the successor of Friedrich Spahnheim the younger (1632-1701). He died at Leiden on the 22nd of October 1708.

Witsius tried to mediate between the orthodox theology and the "federal" system of Johannes Cocceius, but did not succeed in pleasing either party. The more important of his works are:

Iudaus christiansannis—circa principia fidei et SS. Trinitatem (Utrecht, 1661); De oeconomia foederum Dei cum hominibus (1677), still regarded as one of the clearest and most suggestive expositions of the so-called "federal" theology; Diatribae de septem epistolam apocalipticam sensum historico ac propter (Franeker, 1678); Exercitationes sacrae in symbolum quod apostolici didicet in gloria Domini (Franeker, 1684); Miscellaneae sacrae (Utrecht, 1692-1700, 2 vols).

WITTE, SERGE JUDJEVIC, COUNT (1849—), Russian statesman, was born at Tiflis, where his father (of Dutch extraction) was a member of the Viceregal Council of the Caucasus. His mother was a lady of the Fadeyev family, by whom he was brought up as a member of the Eastern Orthodox Church and thoroughly imbued with nationalist feeling in the Russian sense of the term. After completing his studies at Odessa University, in the faculty with which his special pursuit was physical science, and devoting some time to journalism in close relations with the Slavophils and M. Katkov, he entered in 1877 the service of the Odessa State railway, and so distinguished himself in the transport operations necessitated by the Turkish campaign of 1877-1878, that he was soon afterwards appointed general traffic manager of the South-Western railway of Russia and member of an Imperial commission which had to study the whole question of railway construction and management throughout.
the empire. His speciality was an intimate acquaintance with the problem of railway rates in connexion with the general economic development of the country, and in 1884 he published a work on the subject which attracted some attention in the official and the press, especially in Prussia. He was appointed state railway commissioner in Bavaria, and up to 1890 held this position, when he was appointed by the state railway commissioner in the financial administration of the railways, where he was the head of the railway department. He was also an ardent disciple of the railway reform, and had a good knowledge of the railway system of Germany and the rest of the world. He was one of the first to introduce modern railway techniques and systems in Bavaria.

Bertold I., with greatly reduced privileges. Arnulf's younger son, Arnulf II., continued the struggle against Otto I., and sometime before his death in 934 was made count palatine in Bavaria. This office did not become hereditary, however, and his descendants bore simply the title of counts of Schevern until about 1116, when the German king Henry V. recognized Count Otto V. as count palatine in Bavaria. His son, Count Otto VI., who succeeded his father in 1155, accompanied the German king, Frederick I., to Italy in 1154, where he distinguished himself by his courage, and later rendered valuable assistance to Frederick in Germany. When Henry the Lion, duke of Saxony and Bavaria, was placed under the imperial ban in 1180, Otto's services were rewarded by the investiture of the dukedom of Bavaria at Altenburg. Some 500 years later, the time of Otto I. Bavaria has been ruled by the Wittelsbachs.

Otto died at Pfuhlendorf in 1183, and was succeeded in the duchy by his son, Louis I. (1174-1231), but the dignity of count palatine in Bavaria passed to his brother Otto, whose son Otto, succeeding in 1189, murdered the German king Philipp at Bamberg on the 21st of June 1208. He was placed under the ban by the emperor Otto IV., and was killed at Oberndorf, near Regensburg, by Henry of Kalden, marshal of the empire, in March 1209. His lands passed to his son Louis, then only nine years old, who began his rule in 1212. In 1208 he destroyed the ancestral castle of the Wittelsbach, the site of which is now marked by a church and an obelisk.

At first Louis supported Otto IV. in his struggle with Frederick of Hohenstaufen (the emperor Frederick II.), but deserted his cause when Frederick invested his son, Otto, with the Palatinate of the Rhine in 1214. Louis appears to have been previously promised this succession, and to strengthen his claim married his son, Otto, to Agnes, the sister of Henry, the count palatine, who died without heirs in 1214. Louis accompanied the Crusaders to Damietta in 1221, and governed Germany as regent from 1235 until 1248, when he deserted Frederick II. at the instigation of Pope Gregory IX. He was murdered at the bridge of Kelheim on the 15th of September 1231, and the emperor was generally suspected of complicity in the deed. Louis' son, Otto the Illustrious (1206-1233), undertook the government of the Palatinate in 1228, and became duke of Bavaria in 1231. He was attached to the Hohenstaufen by the marriage of his daughter, Elizabeth, with Conrad, son of Frederick II. in 1246. He supported Frederick in his struggle with the anti-kings, Henry Raspe, landgrave of Thuringia, and William II., count of Holland, and was put under the papal ban by Pope Innocent IV., but, after being laid up with the gout, went to Italy in 1251. Otto remained as his representative in Germany, until his death on the 29th of November 1253. He left two sons, Louis and Henry, who reigned jointly until 1255, when a division of the lands was made, by which Louis II. (1228-1294) received upper Bavaria and the Palatinate of the Rhine, and Henry I. (d. 1290) lower Bavaria. Louis, who soon became the most powerful prince in southern Germany, was called "the Stern," because in a fit of jealousy he caused his first wife, Maria of Brabant, to be executed in 1256. He was the uncle and guardian of Conrad of Hohenstaufen, whom he assisted to make his journey to Italy in 1257, and accompanied as far as Verona. When Conradin was executed in 1268 Louis inherited his lands in Germany, sharing them with his brother Henry. In 1273 he was a candidate for the German crown, but was induced to support Rudolph, count of Habsburg, whose eldest daughter, Matilda, he married in this year. He was a great source of strength to the Habsburgs until his death in 1294. Lower Bavaria was ruled by the descendants of Henry I. until the death of his great-grandson, John I., in 1340, when it was again united with upper Bavaria. The sons of Louis, Rudolph I. (d. 1310) and Louis, who became German king as Louis IV. in 1314, ruled their lands in common, but after some trouble between them Rudolph abdicated in 1317.

In 1320 the most important division of the Wittelsbach lands took place. By the treaty of Pavia in this year, Louis granted the Palatinate of the Rhine and the upper Palatinate of Bavaria to
to his brother’s sons, Rudolph II. (d. 1532) and Rupert I. Rupert, who from 1535 to 1590 was sole ruler, gained the electoral dignity for the Palatinate of the Rhine in 1535 by a grant of some lands in present-day Bavaria to the Elector Charles IV. It had been exercised from the division of 1329 by both branches in turn. The descendants of Louis IV. retained the rest of Bavaria, but made several divisions of their territory, the most important of which was in 1392, when the branches of Ingoldstadt, Munich, and Landshut were founded. These were reunited under Albert IV., duke of Bavaria-Munich (1447-1508) and the upper Palatinate was added to them in 1628. Albert’s descendants ruled over a united Bavaria, until the death of Duke Maximilian III. in 1777, when it passed to the Elector Palatine, Charles Theodore. The Palatinate of the Rhine, after the death of Rupert I. in 1590, passed to his nephew, Rupert II., and in 1598 to his son, Rupert III., who was German king from 1400 to 1410. On his death it was divided into four branches. Three of these had died out by 1550, and their possessions were inherited by the fourth or Sinnern line, among whom the Palatinate was again divided (see Palatinat).

In 1742, after the extinction of the two senior lines of this family, the Sulzbach branch became the senior line, and its head, the elector Charles Theodore, inherited Bavaria in 1777. He died in 1799, when it passed to his son, Joseph, head of the Sulzbach branch, inherited Bavaria and the Palatinate. He took the title of king of Maximilian I.

In 1623, when the elector Frederick V. (the “Winter King”) was driven from his dominions, the electoral privilege was transferred to Bavaria, and in 1648, by the Peace of Westphalia, an eighth electorate was created for the Wittelsbachs of the Palatinate, and was exercised by the senior branch of the family.

The Wittelsbachs gave three kings to Germany, Louis IV., Rupert and Charles VII. Members of the family were also margraves of Brandenburg from 1333 to 1373, and kings of Sweden from 1624 to 1718.

Wittmann, Monumenta Wittelsbacensis (Urkundenbuch, Munich, 1857-1861); K. T. Heigel, Die Wittelsbacher (Munich, 1880); F. Leitschuh, Die Wittelsbacher in Bayern (Bamberg, 1894).

WITTEN, a town of Germany, in the Prussian province of Westphalia, favourably situated among the coal-fields of the Ruhr, 14 m. E. of Essen and 16 miles by rail from Dortmund.

WITTENBERG, a town of Germany, in the Prussian province of Saxony, situated on the Elbe, 50 m. by rail S.W. of Berlin, on the main line to Halle and at the junction of railways to Falkenberg, Torgau and Rosslau.

The parish church, in which Luther often preached, was built in the 14th century, but has been much altered since Luther’s time. It contains a magnificent painting by Lucas Cranach the elder, representing the Lord’s Supper, Baptism and Confession, also a font by Hermann Vischer (1457). The present infantry barracks were at one time occupied by the university of Wittenberg, founded in 1502, but merged in the university of Halle in 1815. Luther was appointed professor of philosophy here in 1508; and the new university rapidly acquired a considerable reputation from its connexion with the early Reformers. In opposition to the strict Lutheran orthodoxy of Jean it represented the more moderate doctrines of Melanchthon. In the Wittenberg Concord (1536) the reformers agreed to a settlement of the eucharistic controversy. Shakespeare made Wittenberg, and Horatio study at Wittenberg. The ancient electoral palace is another of the buildings that suffered severely in 1700; it now contains archives. Melanchthon’s house and the house of Lucas Cranach the elder (1472-1553), who was burgomaster of Wittenberg, are also pointed out. Statues of Luther (by Schadow), Melanchthon and Bugenhagen embellish the town. The spot, outside the Elster Gate, where Luther publicly burned the papal bull in 1520, is marked by an oak tree. Floriculture, iron-founding, distilling and brewing are carried on. The country manufactures include the manufacture of the heavier kinds of cloth has died out.

Wittenberg is mentioned as early as 1280. It was the capital of the little duchy of Saxe-Wittenberg, the rulers of which afterwards became electors of Saxony; and it continued to be a Saxon residence under the Ernestine electors. The Capitulation of Wittenberg (1547) is the name given to the treaty by which John Frederick the Magnanimous was compelled to resign the electoral dignity and most of his territory to the Albertine branch of the Saxon family. In 1760 the town was bombarded by the Russians and shelled by the French, and refortified in 1813 by command of Napoleon; but in 1814 it was stormed by the Prussians under Taupitzentz, who received the title of “von Wittenberg” as a reward. Wittenberg continued to be a fortress of the third class until the reorganization of the German defences after the foundation of the new empire led to its being dismantled in 1873.

See Mesny, Geschichte der Stadt Wittenberg (Essen, 1858); Steitz, Die Schlösser und Veste zu Wittenberg (Wittenberg, 1860); Zittlow, Die Begräbnisstätten Wittenbergs und ihre Denkmäler (Wittenberg, 1897); and Gurlitt, “Die Lutherstadt Wittenberg,” in Muther’s Deutsche Kunst (Berlin, 1902).

WITTENBERGE, a town of Germany, in the Prussian province of Brandenburg, on the Elbe, near the influx of the Stepenitz into that river, 72 m. N.W. from Berlin by the main line of railway to Hamburg, and at the junction of railways to Stendal, Lüneburg and Perleberg.

The magnificent bridge here spanning the Elbe, one mile in length, was built in 1851 at a cost of £237,500. The chief industries are the manufacture of railway plant, cloth, wool, soap, shoddy, furniture, bricks and cement.

WITTEGENSTEIN, LUDWIG ADOLF PETER, Count, prince of Sayn-Wittenstein-Ludwigsburg (1760-1843), Russian soldier, was descended from a family of independent citizens in Westphalia. His father had settled in Russia, and he entered the army, distinguishing himself in the Polish War of 1794-95, and then serving in the Caucasus. In 1805 he fought at Austerlitz, in 1806 against the Turks and in 1807 against Napoleon at Friedland and against the Swedes in Finland. In the war of 1812 he commanded the right wing army of the Russians. In the campaign of 1813 in January he took over the command of the Russian army after Kutuzov’s death. But after the defeat of the Spring campaign he laid down this command and led an army corps during the Dresden and Leipzig campaigns, and at Bar-sur-Aube in the 1814 campaign he was severely wounded. In 1823 he was promoted field-marshall, and in 1828 he was appointed to command the Russian army in the war against Turkey. But ill health soon obliged him to retire. In 1834 the king of Prussia gave him the title of prince. He died on the 11th of June 1843.
WITTINGAU—WŁADYSŁAUS

WITTINGAU (Czech, Těšet), a town of Bohemia, 95 m. S. of Prague by rail. Pop. (1900) 5467, mostly Czech. The parish church is a Gothic edifice of the 14th century to the side, with fine cloisters; and the chateau, once belonging to the family of Rosenberg, and now Prince Schwarzenberg, dating from the 13th century, is reputed to contain the most extensive and valuable archives in Bohemia. The artificial cultivation of fish, now chiefly carp, in the numerous ponds that surround the town dates from the 14th century.

WITU, or WITI, a sultanate of East Africa included in the Tanaland province of the British East Africa protectorate. It extends along the coast from the town of Kipini at the mouth of the Oal river (2° S. latitude) to the coast of Caramo (2° S.), a distance of 540 m. The chief town, Witu, is 16 m. N. of Kipini. The state was founded by Ahmed-bin-Fumo Luti, the last Nahyan sultan of Patta (an island off the coast), who was conquered by Seyyid Majid of Zanzibar. Ahmed, about 1860, took refuge in the forest district, and made himself an independent chief, acquiring the title of Simba or the Lion. In 1885 Ahmed was induced to place his country under German protection, and in 1887 the limits of Witu were fixed by international agreement. In 1890 Germany transferred her protectorate to Great Britain. In the autumn of the same year a British naval squadron under Sir E. Fremantle was sent against the sultan Bakari, who had succeeded Ahmed in 1887 and by whose orders nine German traders and settlers had been murdered. Disorders continued until 1894, and in the following year Omar-bin-Hamed of the Nahban dynasty—an ancient race of Asiatic origin—was recognized as sultan. The sultan is guided by a British resident, and the state since the accession of Sultan Omar has been both peaceful and prosperous. The population of the sultanate is over 15,000; of the town of Witu 6000, chiefly Swahili. The port of Witu is Mkonumbe (pop. 1000). WIVESCOB, a market town in the western parliamentary division of Somersetshire, England, 94 m. W. of Taunton by the Great Western railway. Pop. (1901), 2246. It stands on a picturesque sloping site in a hilly district, and has some agricultural trade and a brewing industry, while in the neighbourhood are slate quarries.

Traces of a large Roman camp may still be seen to the south-east of Wiveliscombe (Wellescombe, Wilscome, Writscombe), which is near the line of a Roman road, and hoards of Roman coins have been discovered in the neighbourhood. The town probably borrowed its name from the position for which it was the site of a Danish fort, later replaced by a Saxon settlement. The overlords were the bishops of Bath and Wells, who had a palace and park here. They obtained a grant of freewarren in 1257. No charter granting self-government to Wiveliscombe has been found, and the only evidence for the traditional existence of a borough is that part of the town is called "the borough," and that until the middle of the 19th century a bailiff and a portreeve were annually chosen by the court leet. A weekly market on Tuesdays, granted to the bishop of Bath and Wells in 1384, is still held. During the 17th and 18th centuries the town was a centre of the woollen manufacture.

WŁADYSŁAUS (Władysław), the name of four kings of Poland and two Polish kings of Hungary.

WŁADYSŁAUS I. (1260-1333), king of Poland, called Lokietek, or "Span-long," from his diminutive stature, was the re-creator of the Polish realm, which in consequence of internal quarrels had at the end of the 13th century split up into fourteen independent principalities, and become an easy prey to her neigh- bours, Bohemia, Lithuania, and, most dangerous of all, the Teutonic Order. In 1296 the gentry of Great Poland elected Wladyslaw, then prince of Cujavia, to reign over them; but

1 In Hungarian history the Polish Władysław (Mag. Ullásfal) is distinguished from the Hungarian Ladislaus (László). They are reckoned separately for purposes of numbering. Besides the Władysław kings of Poland, there were three earlier dukes of this name: Władysław I. (d. 1102), Władysław II. (of Cracow, d. 1163), and Władysław III., duke of Great Poland and Cracow (d. 1231). By some historians these are included in the numbering of the Polish sovereigns, King Władysław I. being thus IV. and so on.

WŁADYSŁAUS II., JAGIELLO (1350-1434), king of Poland, was one of the twelve sons of Oligerd, grand-duke of Lithuania, who succeeded his father in 1317. From the very beginning of his reign Jagiello was involved in disputes with the Teutonic Order, and with his uncle, the valiant Kiejstut, who ruled Samogitia independently. By the treaty of Davidszeik (June 1, 1380) he contracted an alliance with the knights, and two years later, acting on the advice of his evil counsellor, Wojdylio, enticed Kiejstut and his consort to Krewo and there treacherously murdered them (Aug. 15, 1382). This foul deed naturally drove Witowt (q.v.), the son of Kiejstut, into the arms of the Order; but both princes speedily recognized that the knights were the real enemies of Lithuania, and prudently composing their differences invaded Prussian territory. This was the beginning of the fifty years' struggle with the Teutonic Order which was to make the reign of Jagiello so memorable. He looked about him betimes for allies against the common enemy of the Slavonic races, and fortune singularly favoured him. The Poles had brought their young queen Jadwiga home from Hungary, and in 1384 Jagiello sent a magnificent embassy to Cracow offering her his hand on condition that they shared the Polish crown. Jadwiga had long been betrothed to William of Austria: but she sacrificed her predilections for her country's good. On the 15th of February 1386 Jagiello, who had previously been elected king of Poland under the title of Władysław II., accepted the Roman faith in the cathedral of Cracow, and on the 18th his espousals with Queen Jadwiga were solemnized. Jagiello's first political act after his coronation was the conversion of Lithuania to the true religion. This solemn act was accomplished at Vilna, the Lithuanian capital, on the 17th of February 1387, when a stately concourse of nobles and prelates, distrusting the capacity of the taciturn little man, they changed their minds and placed themselves under the protection of the powerful Wenceslaus, king of Bohemia, who was crowned at Nesen in 1306. Władysław thereupon went to Rome, where Pope Boniface VIII., jealous of the growing influence of Bohemia, adopted his cause; and on the death of Wenceslaus in 1305 Władysław succeeded in uniting beneath his sway the principalities of Little and Great Poland. From the first he was beset with great difficulties. The towns, mostly of German origin, and the prelates headed by Muskatka, bishop of Cracow, were against him because he endeavoured to make use of their riches for the defence of the sorely pressed state. The rebellious marquises of Czarnyberg and others were pressing, but he had to invoke the aid of the Teutonic Order to save Danzig from the margraves of Brandenburg, thus saddling Poland with a far more dangerous enemy; for the Order not only proceeded to treat Danzig as a conquered city, but claimed possession of the whole of Pomerania. Władysław thereupon (1317) appealed to Pope John XXII., and a tribunal of local prelates appointed by the holy see ultimately (Feb. 9, 1321) pronounced judgment in favour of Władysław, and condemned the Order not only to restore Pomerania but also to pay heavy damages. But the tribunal was a mere fiction, and the Pope did not send a man to take charge of the kingdom. This was the beginning of the rebirth of the nation. Jagiello's crown was not unreasonable; for the country was now at peace, the national consciousness had been awakened, the power of the nobles had been checked, and the wealth of the country was increasing. All these causes combined to enable Jagiello to begin the very long work of converting Poland into a nation.
headed by the king, proceeded to the grove of secular oaks beneath which stood the statue of Perkusno and other idols, and in the presence of an immense multitude hewed down the oaks, destroyed the idols, extinguished the sacred fire and elevated the cross on the desecrated heathen altars, 30,000 Lithuanians receiving Christian baptism. A Catholic hierarchy was immediately set up. A Polish Franciscan, Andrew Wassilko, was consecrated as the first Catholic bishop of Vilna, and Lithuania was divided ecclesiastically into seven dioceses. Mainly on the initiative of Queen Jadwiga, Red Russia with its capital the great trading city of Lemberg was persuaded to acknowledge the dominion of Poland; and there on the 27th of September 1387 the hospodars of Walachia and Moldavia for the first time voluntarily enrolled themselves among the vassals of Poland.

With savage Lithuania converted and in close alliance with Catholic Poland, the Teutonic Order was seriously threatened. The knights endeavoured to re-establish their position by sowing dissensions between Poland and Lithuania. In this for a time they succeeded (see Bytown); but in 1401 Jagiello recognized Witowt as independent grand-duke of Lithuania (union of Vilna, Jagiello 18, 1401), and their union was cemented in the battle of Grunewald, which shook the whole fabric of the Teutonic Order to its very foundations. Henceforth a remarkable change in the whole policy of the Order was apparent. The struggle was no longer for dominion but for existence. Fortunately for them, in Jagiello they possessed an equally cautious and pacific opponent. Wladislaus II., in sharp contrast to Witowt, was of anything but a martial temperament. He never swerved from his main object, to unite Poland and Lithuania against the dangerous denationalizing German influences which environed him. He would take no risks and always preferred craft to violence. Hence his leaning upon the holy see in all his disputes with his neighbours. Hence, too, his moderation at the peace of Thorn (1st of February 1411), when the knights skillfully extricated themselves from their difficulties by renouncing their pretensions to Samogitia, restoring Dobrzyn and paying a war indemnity; Jagiello was content to discredit them rather than provoke them to a war à outrance. Equally skilful was Jagiello's long diplomatic duel with the emperor Sigismund, then the disturbing element of Central Europe, who aimed at the remodelling of the whole continent and was responsible for the first projected partition of Poland.

Jagiello was married four times. At the dying request of the childless Jadwiga he espoused a Styrian lady, Maria Cillel, who bore him a daughter, also called Jadwiga. His third wife, Elizabeth Grabowska, died without issue, and the question of the succession then became so serious that Jagiello's advisers counselled him to betroth his daughter to Frederick of Hohenzollern, who was to be educated in Poland as the heir to the throne. But in 1422 Jagiello himself solved the difficulty by wedding Sofia of Vyazma, a Russian lady rechristened Sophia, who bore him two sons, Wladislaus and Casimir, both of whom ultimately succeeded him. Jagiello died at Grodko near Lemberg in 1434. During his reign of half a century Poland had risen to the rank of a great power, a position she was to retain for nearly two hundred years under the dynasty which Jagiello had founded.

See August Sokolowski, History of Poland, vol. I. (Pol.) (Vienna, 1909); Wladyslaw Dyjas, Ruso-Litowskom Actu (St. Petersburg, 1868); Monumenta Medii Aevi (Cracow, 1882); Karol Szajnocha, Jadwiga and Jagiello (Pol.) (Lemberg, 1855-1866);

Wladislaus III. (1424-1444), king of Poland and Hungary, the eldest son of Wladislaus II. Jagiello, by his fourth wife, Sophia of Vyazma, was born at Cracow on the 31st of October 1434, succeeding to the throne in his tenth year. The domestic troubles which occurred during his minority had an important influence on the development of the Polish constitution; but under the wise administration of Zbigniew Olesnicki Poland suffered far less from her rebels than might have been anticipated, and Wladislaus gave the first proof of his manhood by defeating thearch-treacher Spytek of Melzyn in his camp at Grotnik on the 4th of May 1439. On the sudden death of the emperor Albert, who was also king of Bohemia and Hungary, the Hungarians elected Wladislaus as their king, despite the opposition of the widowed empress Elizabeth, already big with the child who subsequently ascended the Hungarian throne as Wladislaus V. But Wladislaus III., who was solemnly crowned king of Hungary at Buda by the Magyar primate in July 1440, had to fight against the partisans of the empress for three years till Pope Eugenius IV. mediated between them so as to enable Wladislaus to lead a crusade against the Turks. War was proclaimed against Sultan Murad II. at the dict of Buda on Palm Sunday 1443, and with an army of 40,000 men, mostly Magyars, the young prince started for the Danube with Peter of Bosnia. But the Danube, took Nish and Sofia, and advancing to the slope of the Balkans, returned to Hungary covered with glory. Europe resounded with the praises of the youthful hero, and the Venetians, the Genoese, the duke of Burgundy and the pope encouraged Wladislaus to continue the war by offering him every assistance. But at this juncture the sultan offered terms to Wladislaus through George Brankovic, despot of Servia, and, by the peace of Szeged (July 1, 1444), Murad engaged to surrender Servia, Albania and whatever territory the Ottomans had ever conquered, resuming all fortresses, besides paying an indemnity of 100,000 florins in gold. Unfortunately, Wladislaus listened to the representations of the papal legate, Cardinal Julian Cesarini, who urged him in the name of religion to break the peace of Szeged and resume the war. Despite the representations of the Poles and of the majority of the Magyars, the king, only two days after solemnly swearing to observe the terms of the treaty, crossed the Danube a second time to cooperate with a fleet from the West which was to join hands with the land army at Gallipoli, whither also the Greeks and the Balkan Slaves were to direct their auxiliaries. But the Walachians were the sole allies of Hungary who kept faith with her, and on the bloody field of Varna, November the 10th, 1444, Wladislaus lost his life and more than a fourth of his army.

See Julian Batorzewicz, View of the Relations of Poland with the Turks and Tatars (Pol.) (Warsaw, 1860); August Sokolowski, History of Poland, vol. II. (Pol.) (Vienna, 1904); Ignacz A. Grabowska, History of the Hungarian Realm, vol. I. (Hung.) (Budapest, 1905);

Wladislaus IV. (1595-1648), king of Poland, son of Sigismund III., king of Poland, and Anne of Austria, succeeded his father on the throne in 1632. From his early youth he gave promise of great military talent, and served his apprenticeship in the science of war under Zolkiewski in the Muscovite campaigns of 1610-1612, and under Chodkiewicz in 1617-1618. Wladislaus's first official act was to make the Muscovite sultan desist from declaring war against Poland immediately after the death of Sigismund, and to besieging Smolensk, the key of Poland's eastern frontier. After a series of bloody engagements (Aug. 7-22, 1632) Wladislaus compelled the tsar's general to abandon the siege, and eventually to surrender (March 1, 1634) with his whole army. Meanwhile the Turks were threatening in the south, and Wladislaus found it expedient to secure his Muscovite conquests. Peace was concluded at the river Polyanokova on the 28th of May 1634, the Poles conceding the title of tsar to Michael Romanov, who renounced all his claims upon Livonia, Estonia and Courland, besides paying a war indemnity of 200,000 rubles. These tidings profoundly impressed Sultan Murad, and when the victorious Wladislaus appeared at Lemberg, the usual starting-point for Turkish expeditions, the Porte offered terms which were accepted in October, each power engaging to keep their borderers, the Cossacks and Tatars, in order, and divide between them the suzerainty of Moldavia and Walachia, the sultan binding himself always to place philo-Polish hospodars on those slippery thrones. In the following year the longer war was brought to an end. The Porte, allotted very much to the advantage of Poland, by the truce of Stidendorff, which was to last for twenty-six years from the 12th September 1635. Thus externally Poland was everywhere triumphant. Internally, however, things were in their usually deplorable state owing to the suspicion, jealousy and parsimony of the estates of the realm. They had double reason to be grateful to Wladislaus for defeating the enemies of the republic, for he had also paid for the expenses of his campaigns out of his own pocket.
yet he could not obtain payment of the debt due to him from the state till 1643. He was bound by the pacta conventa which he signed on his accession to maintain a fleet on the Baltic. He proposed to do so by levying tolls on all imports and exports passing through the Prussian ports which had been regained by the truce of Stumendorf. Sweden during her temporary occupation of these ports had derived from them an annual income of 3,600,000 gulden. But when Wladislaus, their lawful possessor, imposed similar tolls in the interests of the republic, Danzig protested and appealed to the Scandinavian powers. Wladislaus's little fleet attempted to blockade the port of the rebellious city, whereupon a Danish admiral broke the blockade and practically destroyed it. This, of course, not only gave Sweden an advantage of her own privileges, allowed the insult to the king and the injury to the state to pass unnoticed, conning at the destruction of the national navy and the depletion of the treasury, "lest warships should make the crown too powerful." For some years after this humiliation, Wladislaus became indifferent to affairs and sank into a sort of apathy; but the birth of his son Sigismund (by his first wife, Cecilia Renata of Austria, in 1640) gave him fresh hopes, and he began with renewed energy to labour for the dynasty as well as for the nation. He saw that Poland, with her existing constitution, could not hope for a long future, and that the results of her present condition would be ruinous. He therefore set about the task of home and national reform along with it by every means in his power. He began by founding the Order of the Immaculate Conception, consisting of 72 young noblemen who swore a special oath of allegiance to the crown, and were to form the nucleus of a patriotic movement antagonistic to the constant usurpations of the diet, but the sejm promptly intervened and quashed the attempt. Then he conceived the idea of using the Cossacks, who were deeply attached to him, as a means of chastising the szlachta, and at the same time forcing a war with Turkey, which would make his military genius indispensable to the republic, and at the same time present him if successful to carry out domestic reforms by force of arms. His chief confidant in this still mysterious affair was the veteran grand hetman of the crown, Stanislaw Koniecpolski, who understood the Cossacks better than any man then living, but differed from the king in preferring the conquest of the Crimea to an open war with Turkey. Simultaneously Wladislaus contracted an offensive and defensive alliance with Venice against the Porte, a treaty directly contrary to the pacta conventa he had sworn to observe, but excusable in the desperate circumstances. This was the first step in the preparation of Koniecpolski before it was matured, partly to the hasting with which the king published his intentions, and partly to the careful avoidance by the Porte of the slightest occasion of a rupture. Frustrated in all his plans, broken-hearted by the death of his son (by his second wife, Marie Ludwika of Angoulême, Wladislaus had no issue), the king, worn out and disillusioned, died at Merecz on the 20th of May 1648, in his 52nd year. After his cousin Gustavus Adolphus, whom in many respects he strikingly resembled, he was indubitably the most amiable and brilliant of all the princes of the House of Vasa.

See Wiktor Czernak, The Plantaimie the Turkish Wars of Wladislaus IV (1632-1648), (Cracow, 1897); V. V. Volk-Karachevsky, The Struggle of Poland with the Cossacks (Russ.) (Kiev, 1899); Letters and other Writings of Wladislaus IV. (Pol.) (Cracow, 1845). (R. N. B.)

**WOAD**—WODEN

**WOAD,** a herbaceous plant, known botanically as *Isatis tinctoria* (natural order Cruciferae), which occurs sporadically in England in fields, on banks and chalk-pits. The erect branched stem, 1 to 3 ft. in height, bears sessile leaves and terminal clusters of small yellow flowers; the brown pendulous pods are ½ in. long. The ancient Britons stained themselves with this plant.

**WOBURN,** a market town in the northern parliamentary division of Bedfordshire, England, with a station (Woburn Sands), on a branch of the London & North-Western railway, 2 m. from the town and 51 m. N.W. by N. from London. Pop. (1901) 1120. It lies in a hollow of a northern spur of the Chiltern Hills, in a finely wooded locality. There is some agricultural trade, and a little straw-plaiting and lace-making are carried on. To the west of the town lies Woburn Park, the demesne of Woburn Abbey, the seat of the dukes of Bedford. The abbey was a Cistercian foundation of 1145, but only scantly remains of the buildings are seen in the mansion which rose on its site. This, with most of the abbey lands, was granted by Henry VIII. to John, Lord Russell, in 1547, who was created earl of Bedford in 1550 (the dukedom dating from 1694). The mansion was begun in 1744; it contains a magnificent collection of paintings and other objects of art.

**WOBURN,** a city of Middlesex county, Massachusetts, U.S.A., 10 m. W. by N.W. of Boston. Pop. (1890) 13,495; (1900) 14,254, of whom 3340 were foreign-born and 261 were negroes; 4667 were born in foreign countries; 5462 were born in the state of Massachusetts, 7948 in other states of the Union, and 9945 in a foreign country. The city is served by the southern division of the Boston & Maine railway, and is connected with Burlington, Lexington, Reading, Stoneham, Wilmington, Winchester, Arlington, Boston and Lowell by electric railways. In the city area are several villages, including Woburn proper, known as "the Centre," North Woburn, Woburn Highlands, Cummingsville (in the western part), Mismatch (in the north-east), Montvale (in the east) and Walnut Hill (also in the east). There are two ancient burying-grounds; the oldest, on Park Street, dates from about 1642 and contains the graves of ancestors of four prominent families—Cleveland, Benjamin Harrison, Franklin Pierce and Garfield—and a granite obelisk to the memory of Loammi Baldwin (1744-1807). On Academy Hill is the Warren Academy building used by a Free Industrial School. Forest Park (53 acres) is a fine stretch of natural woods, and there are several small parks and squares; on Woburn Common is the Public Library, by H. H. Richardson, the gift of Charles W.1. The building houses an art gallery and historical museum, and a library of about 50,000 volumes especially rich in Americana. Among colonial houses still standing are the birthplace of Count Rumford (in North Woburn), built in 1744 and now owned by the Rumford Historical Association as a depository for the Rumford Library and historical memorials, and the Baldwin mansion (built partly in 1661 and later enlarged), the home of Loammi Baldwin (1780-1838), known as "the father of civil engineering in America." Woburn's manufactures are concentrated within a small area. The city is the most important leather manufacturing centre of New England: in 1905 the value of the leather product was $2,851,554, being 61-3% of the value of all factory products ($4,654,667); other manufactures are chemicals, leather-working machinery, boots and shoes, glue and cotton goods. Market gardening is an important industry. Woburn, first settled about 1639-1640, was incorporated as a township under its present name in 1642, and was the first township set off from Charlestown. It then included a large part of the present Winchester and the greater part of the present Wilmington and Burlington, separately organized in 1730 and 1790 respectively. It was named after Woburn in Bedfordshire by its chief founder, Edward Johnson (1599-1672), whose work, *The Wonder-Working Providence of Zion's Saviour* (1654; latest ed. 1910), was one of the earliest historical accounts of the Massachusetts Bay Colony. The leather industry was developed by David Cummings at Cummingsville shortly before the War of Independence. Woburn's industrial growth dates from the construction through the township of the old Middlesex Canal. The city was chartered in 1888.

**WOCHA** (Acrutia), a pygmy people of Africa, living in the forests of the Mabode district, south of the Welle. They were discovered (1880-1881) by Dr. W. Junker, who described them as "well proportioned, though the oval-shaped head seemed somewhat too large for the size of the body." Some are of light complexion, like the Akka and Batwa, but as a general rule they belong to the darker, crisper-haired, more genuine negro stock.

**WODEN,** a deity of the Anglo-Saxons, the name being the Anglo-Saxon counterpart of the Scandinavian Odin (q.v.). In German the same god was called Woden or Wuotan. Owing
WOOLFING, MARGARET [PEG] (c. 1714-1760), English actress, was born at Dublin, of poor parents. As a child of ten she played Polly Peachum in a little presentation of The Beggar's Opera, the first Dublin theatre until 1740, when her success as Sir Harry Wildair in The Covent Couple secured her a London engagement. In this, and as Sylvia in The Recruiting Officer, she had a pronounced success, and at Drury Lane and Covent Garden, as well as in Dublin, she appeared in all the plays of the day to ever growing popularity. Among her best impersonations were the elegant women of fashion, like Lady Betty Modish and Lady Townley, and in "breeches parts" she was unapproachable. She lived openly with Garrick, and her other love affairs were numerous and conspicuous. She was a spendthrift, and her beauty and kindliness of heart were equally well known. She educated her sister Mary, and could hardly have pensioned her mother. She built and endowed by will some houses at Teddington, where she lived quietly after her retirement in 1757.

See Austin Dobson's introduction to Charles Reade's novel Peg Woffington (London, 1899), and Augustin Daly's Woffington: a Tribute to the Actress and the Moralist (1886).

WOHLER, FRIEDRICH (1800-1882), German chemist, was born at Eschersheim, near Frankfort-on-the-Main, on the 31st of July 1800. In 1814 he began to attend the gymnasium at Frankfort, where he carried out experiments with his friend Dr J. C. Buch. In 1820 he entered Marburg University, and next year removed to Heidelberg, where he worked in Leopold Gmelin's laboratory. Intending to practise as a physician, he took his degree in medicine and surgery (1825), and was persuaded by Gmelin to devote himself to chemistry. He studied in Berzelius's laboratory at Stockholm, and there began a lifelong friendship with the Swedish chemist. On his return he had proposed to settle as a Privatdozent at Heidelberg, but accepted the post of teacher of chemistry in the newly established technical school (Gewerbeschule) in Berlin (1825), where he remained till 1831. Private affairs then called him to Cassel, where he soon became professor at the higher technical school. In 1836 he was appointed to the chair of chemistry in the medical faculty at Göttingen, holding also the office of inspector-general of pharmacies in the kingdom of Hanover. This professorship he held until his death on the 23rd of September 1882.

Wohler had made the acquaintance of Liebig, his junior by three years, in 1825, and the two men remained close friends and allies during the remainder of their lives. Together they carried out a number of joint researches. One of the earliest, and still unsurpassed, was the investigation, published in 1830, which proved the polymerism of cyanic and cyanuric acid, but the most famous were those on the now known alkali metals, lithium (1846), sodium (1846), potassium (1846), and on uric acid (1837), which are of fundamental importance in the history of organic chemistry. But it was the achievement of Wöhler alone, in 1828, to break down the barrier held to exist between organic and inorganic chemistry by artificially preparing urea, one of those substances which up to that time it had been thought could only be produced through the agency of "vital force.

Most of his work, however, lay in the domain of inorganic chemistry. The isolation of the elementary bodies and the investigation of their properties was one of his favourite pursuits. In 1827 he obtained metallic aluminium as a fine powder, and in 1845 improved methods enabled him to get several metallic globules. Nine years afterwards H. E. Sainte-Claire Deville, ignorant of what he had done, adopted the same methods in his efforts to prepare the metal on an industrial scale; the result of Wöhler's claim of priority was that the two became good friends and joined in a research, published in 1856-1857, which yielded "adamantine boron." By the same method as had succeeded with aluminium (reduction of the chloride by metallic sodium) Wöhler in 1828 obtained metallic beryllium and yttrium. Later, in 1849, titanium engaged his attention, and, proving that what had up to that time passed as the metal was simply a cyanide, he showed how the true metal was to be obtained. He also worked out a process for carrying out an inquiry on the compounds of silicon in which they prepared the previously unknown gas, silicon hydride or silicured. A problem to which he returned repeatedly was that of separating nickel and cobalt from their ores and freeing them from arsenic; and in the course of his long laboratory practice he worked out numerous processes for the preparation of pure chemicals and methods of exact analysis.

The Royal Society's Catalogue enumerates 276 separate memoirs written by him, apart from 43 in which he collaborated with others.
WOHLGEMUTH—WOLCOT

WOORKINGHAM, a market town and municipal borough in the Wokingham parliamentary division of Berkshire, England, 36 m. W. by S. of London by the South-Western railway, served also by the South-Eastern and Chatham railway. Pop. (1901) 3551. It lies on a slight eminence above a valley tributary to that of the river Loddon, in a well-wooded district on the outskirts of the former royal forest of Windsor. The church of St Laurence is Perpendicular, greatly altered by restoration. Two miles west of the town is the village of Bearwood. The trade of Wokingham is principally agricultural. The borough is under a mayor, 4 aldermen and 12 councillors. Area, 557 acres.

Wokingham (Wöorkingh, Oxingh, Ockingham), which was not one of the ancient boroughs of Berkshire and partly in a detached piece of Wiltshire, which is now annexed to Berkshire; the Berkshire portion of the town was in the manor of Sonning, which was held by the bishops of Salisbury from before the Conquest until the reign of Elizabeth. The earliest existing charter to Wokingham is that of Elizabeth (1583), which recites and confirms some ancient customary privileges respecting the election of an alderman and other corporate officers. The governing charter for more than 250 years was that of James I. (1612), incorporating it as a free town under the title of the "Alderman and Burgesses of the Town of Wokingham in the Counties of Berkshire and Wiltshire." Under the provisions of the Municipal Corporations Act of 1882 a new charter of incorporation was granted, instituting a municipal body to consist of a mayor, 4 aldermen and 12 councillors. Wokingham was assessed at £50 for ship-money, and in the raising assessments of 1602 it had a right to sell a manufacture of silk stockings, which flourished as early as 1625, and survived up to the 19th century. The town shared in the benefactions of Laud, and was one of the most important in the county. Its market, which is still held and which, during the first half of the 19th century was devoted for poultry, was granted to the bishop of Salisbury by Henry III. (1219), who also granted (1258) two annual fairs to be held on the sands, and the poor manor of St Barnabas and All Saints respectively; the latter is still kept up, the former appears in the list of fairs held in 1792.

WOLCOT, JOHN (1738–1810), English satirist and poet, known under the pseudonym of PETER PINDAR, was the son of Alexander Wolcot, surgeon at Dodbrooke, adjoining Kingsbridge, in Devonshire, and was baptized there on the 9th of May 1738. He was educated at Kingsbridge free school, at the Bodmin and Liskeard grammar schools, and in France. For seven years he was apprenticed to his uncle, John Wolcot, a surgeon at Poovey, and he took his degree of M.D. at Aberdeen in 1767. In 1769 he was ordained, and went to Jamaica with his uncle's patient, Sir William Trelawny, the new governor. In 1772 he became incumbent of Vere, Jamaica, but on the death of his patron (11th of December 1772) he returned to England, and settled as a physician at Truro. In 1781 Wolcot went to London, and took with him the young Cornish artist, John Opie, whose talents in painting he had been the first to recognize. Before they left Cornwall Wolcot apparently made a rash engagement to share his profits with Wolcot, but a breach between them occurred soon after they settled in London. Wolcot had already achieved some success in a Supplicating Epistle to the Reviewers (1778), and after his settlement in London he threw off with marvellous rapidity a succession of pungent satires. Geoffre III. was his favourite subject of ridicule, and his peculiarities were described or distorted in The Lousiad (1785), Peeps at St James's (1787) and The Royal Visit to Exeter. Two of Wolcot's happiest satires on the 'farmer king' depicted the royal survey of Whitbread's brewery, and the king's naiive wonder how the ale could get into the cask. In the 'parting shot' (1789) he eulogized the prince of Wales. Boswell's biography of Johnson was ridiculed in An Epistle to James Boswell (1786), and in the same year followed another piece, called Beasty and Pionzi. Other subjects were found in Sir Joseph Banks and the Emperor of Morocco (1790), and a Complimentary Epistle to James Bruce (1790). Among his early satires were Lyric Odes to the Academicians (1782), and another series on the same subject Farewell Odes (1786). He specially attacked Benjamin West, but expressed great admiration for the landscapes of Gains- lies and Richard Wilson. He considered himself a mean artist, and in 1797 appeared Six Picturesque Views of Painting by Peter Pindar, engraved by Aiken. In 1795 he disposed of his works to the booksellers for an annuity of £250. His
various pieces were published in 1796 in four octavo volumes and often reprinted. Wolcott cared little whether he hit above or below the belt, and the gross vituperation he indulged in gained him a large following for the pleasure of his readers; but he had a broad sense of humour, a keen eye for the ridiculous, and great felicity of imagery and expression. Some of his serious pieces—his rendering of Thomas Warton's epigram on Sleep and his Lord Gregory, for example—reveal an unexpected fund of genuine tenderness. In William Gifford, who attacked him in the Epistle to P. Pindar, he for once met with more than his match. Wolcott made a personal assault on his enemy in Wright's shop in Piccadilly, but Gifford was too quick for him, and Wolcott was soundly thrashed. He died at Latham Place, Somers Town, London, on the 14th of January 1819, and seven days later was buried, as he had desired, near Samuel Butler, the author of Hudibras, in St. Paul's, Covent Garden.

Polwhele, the Cornish historian, was well acquainted with Wolcott in his early life, and the best account of his residence in the west is found in vol. i. of Polwhele's Traditions and in Polwhele's Biographical Sketches, vol. ii. Cyrus Redding was a frequent visitor at the old man's house, and has described Wolcott's later days in his Past Characters, vol. i., and his Fifty Years' Recollections, vol. i., and.

WOLCOTT, ROGER (1679-1767), American administrator, was born in Windsor, Connecticut, on the 4th of January 1679, the son of Simon Wolcott (d. 1687). He was a grandson of Henry Wolcott (1625-1655) of Galdon Manor, Tolland, Somerset, who emigrated to New England in 1628, assisted John Mason and others to found Windsor, Conn., in 1635, and was a member of the first General Assembly of Connecticut in 1637 and of the House of Magistrates from 1643 to his death. Roger Wolcott was early apprenticed to a weaver and thrown at this trade; he was a member of the Connecticut General Assembly in 1700, one of the Bench of Justices in 1710, commissary of the Connecticut forces in the expedition of 1711 against Canada, a member of the Council in 1714, judge of the county court in 1721 and of the superior court in 1732, and deputy-governor and chief-justice of the superior court in 1741. He was second in command to Sir William Pepperrell, with rank of major-general in the expedition (1745) against Louisbourg, and was governor of Connecticut in 1751-1754. He died in what is now East Windsor, on the 17th of May 1757.

He wrote Poetical Meditations (1725), an epic on The Agency of the Honourable John Winthrop in the Court of King Charles the Second (printed in pp. 262-296 of vol. iv., series 1, Collections of Massachusetts Historical Society) and a pamphlet entitled That "It is more in Congregational churches are and always have been consecrated churches. His Journal at the Siege of Louisbourg is printed in vol. i. (1860) of the Collections of the Connecticut Historical Society.

His son, ERASTUS WOLCOTT (1722-1793) was a member of the Connecticut General Assembly and its speaker; he was a brigadier-general of Connecticut militia in the War of Independence, and afterwards a judge of the Superior Court of Connecticut.

Another son, OLIVER WOLCOTT (1726-1797), graduated at Yale in 1747 and studied medicine with his brother Alexander (1712-1793). In 1751 he was made sheriff of the newly established Litchfield county and settled in Litchfield, where he practised law. He was a member of the Council in 1774-1786 and of the Continental Congress in 1775-1776, 1778 and 1780-1784. Congress made him a commissioner of Indian affairs for the Northern Department in 1775, and during the early years of the War of Independence he was active in raising militia in Connecticut. He was one of the signers of the Declaration of Independence; commanded Connecticut militia that helped to defend New York City in August 1776; in 1777 organized more Connecticut volunteers and took part in the last few days of the campaign against General John Burgoyne; and in 1779 commanded the militia during the British invasion of Connecticut. In 1784, as one of the commissioners of Indian affairs for the Northern Department, he negotiated the treaty of Fort Stanwix (22nd Oct.) settling the boundaries of the Six Nations.

1 Henry Wolcott the younger (d. 1658) was one of the patentees of Connecticut under the charter of 1662.

In 1756-1756 he was lieutenant-governor of Connecticut, and in November 1787 was a member of the Connecticut Convention which ratified the Federal Constitution; he became governor in 1796 on the death of his brother, Samuel Huntington, and served until his death on the 1st of December 1797.

See the sketch by his son Oliver in Sanderson's Biography of the Signers of the Declaration of Independence (Philadelphia, 1820-1827).

Oliver's son, OLIVER WOLCOTT, Jun. (1760-1833), graduated at Yale in 1778, studied law in Litchfield under Judge Tapping Oliver and was admitted to the bar in 1781. With Oliver Ellsworth he was appointed (May 1784) a commissioner to adjust the claims of Connecticut against the United States. In 1788 he was made comptroller of public accounts of Connecticut; in the next year was appointed auditor of the Federal Treasury; in June 1791 became comptroller of the Treasury, and in February 1795 succeeded Alexander Hamilton as Secretary of the Treasury. At the end of 1800 he resigned after a bitter attack by the Democratic-Republican press, against which he defended himself in an Address to the People of the United States. In 1801-1802 he was judge of the Circuit Court of the Second District (Connecticut, Vermont and New York), and then entered business in New York City, where he was president of the short-lived Merchants' Bank (1803) and president (1812-1814) of the Bank of North America. With a brother he then founded factories at Wolcottville (near Litchfield). He re-entered politics as a leader of the "Toleration Republicans," attempting to oust the Congressional clergy from power by adopting a more liberal constitution in place of the charter; he was defeated for governor in 1815, but in 1817 presided over the state convention which adopted a new constitution, and in the same year was elected governor, serving until 1827. He died in New York City on the 1st of June 1833.

His grandson, George Gibbs (1815-1875), in 1846 edited Memoirs of the Administration of Washington and John Adams; ... the Papers of Oliver Wolcott, Secretary of the Treasury. Wolcott wrote British Influence on the Affairs of the United States Preserved and Explained (1804).

A grandson of the second Oliver's brother Frederick was ROGER WOLCOTT (1847-1901), who graduated at Harvard in 1869, and was admitted to the Suffolk bar in 1874. He practised law in Boston, and served in the Massachusetts House of Representatives in 1882-1884 as a Republican. In 1892 he was elected lieutenant-governor (re-elected 1893 and 1895), and in 1896 became acting-governor upon the death (5th March) of Governor Frederick T. Greenhalge. He was elected governor in 1896 and served until 1900. He died on the 21st of December 1901.

EDWARD OLIVER WOLCOTT (1848-1905), a member of the same family, went to Colorado, became interested in silver mining there, was a U.S. Senator in 1889-1901, and was a prominent Republican bimetallist.

See William Lawrence, Roger Wolcott (1847-1901) (Boston, 1902), and for all the family, Samuel Wolcott, Memorial of Henry Wolcott, one of the first settlers of Windsor, Connecticut, and of some of his Descendants (New York, 1881).

WOLF, FRIEDRICH AUGUST (1759-1824), German philologist and critic, was born on the 15th of February 1759 at Hainrode, a little village not far from Nordhausen, in the province of Hesse. His father was the village schoolmaster and organist. In time the family removed to Nordhausen, and there young Wolf went to the grammar school, where he soon acquired all the Latin and Greek that the masters could teach him, besides learning French, Italian, Spanish and music. The precocity of his attainments was only equalled by the force of will and confidence in his own powers which characterized him throughout life. After two years of solitary study, at the age of fifteen, Wolf went (1777) to the university of Göttingen. His first act there was a prophecy—one of those prophecies which sprang from the conscious power to bring about their fulfilment. He had to choose his "faculty," and chose one which then existed only in his own mind, the faculty of "philology." What is even more remarkable, the omen was accepted. He carried his point, and was enrolled as he desired. C. G. Heyne was then the chief ornament of Göttingen, and Wolf and he were not on good terms. Heyne excluded him from his lectures, and brusquely condemned...
Wolf's views on Homer. Wolf, however, pursued his studies in the university library, from which he borrowed with his old aversion. During 1779-1783 Wolf was a schoolmaster, first at Illich, then at Oste. He became as a teacher was striking, and he found time to publish an edition of the Symposium of Plato, which excited notice, and led to his promotion (1783) to a chair in the Prussian university of Halle. The moment was a critical one in the history of education. The literary impulse of the Renaissance was almost spent; scholarship had become dry and trivial. A new school, that of Locke and Rousseau, sought to make teaching more modern and more human, but at the sacrifice of mental discipline and scientific aim. Wolf was eager to throw himself into the contest on the side of antiquity. In Halle (1785-1807), by the force of his will and the enlightened aid of the ministers of Frederick the Great, he was able to carry out his long-cherished ideas and found the science of philology. Wolf defined philology broadly as "knowledge of human nature as exhibited in antiquity." The matter of such a science, he held, must be sought in the history and education of some highly cultivated nation, to be studied in written remains, works of art, and whatever else bears the stamp of national thought or skill. It has therefore to do with both history and language, and primarily as a science of interpretation, in which historical facts and linguistic factors take the role of inanimate objects which remained after. The reader does not feel that he has to do with a theory, but with great ideas, which are left to bear fruit in his mind (see Homer). The publication led to an unpleasant polemic with Heyne, who absurdly accused him of reproducing what he had heard from him at Göttingen.

The Halle professorship ended tragically, and with it the happy and productive period of Wolf's life. He was swept away, and his university with him, by the deluge of the French invasion. A painful gloom oppressed his remaining years (1807-1838), which were spent in the demand of money, suggestiveness, breadth of view. The reader does not feel that he has to do with a theory, but with great ideas, which are left to bear fruit in his mind (see Homer). The publication led to an unpleasant polemic with Heyne, who absurdly accused him of reproducing what he had heard from him at Göttingen.

Mark Pattison wrote an admirable sketch of Wolf's life and work in the North British Review of June 1866, reproduced in his Essays (1889); see also J. E. Sandys, Hist. of Class. Schol. iii. (1908), pp. 51-60. Wolf's Kleine Schriften were edited by G. Bernhardy (Halle, 1869). Works not included are the Prolegomena, the Letters to Heyne (Berlin, 1879), the commentary on the Lepidina (Halle, 1789) and a translation of the Clouds of Aristophanes (Berlin, 1811). These must be added the Vorlesungen von 1814-1819. Taken from the notes of a pupil and edited by Usteri (Bern, 1836). (D. B. M.)

WOLF, HUGO (1860-1903), German composer, was born on the 13th of March 1860 at Windischgraz in Styria. His father, who was in the leather trade, was a keen musician. From him Hugo learned the rudiments of the piano and the violin. After an unhappy school life, in which he showed little aptitude for anything but music, he went in 1875 to the Conservatoire. He appears to have learned very little there, and was dismissed in 1877 because of a practical joke in the form of a threatening letter to the director, for which he was perhaps unjustly held responsible. From the age of seventeen he had to depend upon himself for his musical training. By giving lessons on the piano and with occasional small fees, his father managed to live for several years in Vienna, but it was a life of extreme hardship and privation, for which his delicate constitution and his proud, sensitive and nervous temperament were particularly ill-suited. In 1884 he became musical critic to the Salonblatt, a Viennese society paper, and contrived by his uncompromising trenchant and sarcastic style to win a notoriety which was not helpful to his future prospects. His ardent discipleship of Wagner was unfortunately linked with a bitter opposition to Brahms, for whose works he always retained an ineradicable dislike. The publication at the end of 1887 of twelve of his songs seems to have definitely decided the course of his genius, for about this time he retired from the Salonblatt, and resolved to devote his whole energies to song-composition. The nine years which followed practically represent his life as a composer. They were marked by periods of feverish creative activity, alternating with periods of mental and physical exhaustion, during which he was sometimes unable even to bear the sound of music. By the end of 1891 he had composed the bulk of his works, on which his fame chiefly rests, 43 Mörke Lieder, 20 Eichendorff Lieder, 50 Goethe Lieder, 44 Lieder from Geibel and Heyse's Spanisches Liederbuch, and 22 Lieder by the second part consisting of 24 songs being added in 1896. Besides these there were 13 selections of lyrics by different authors, incidental music to Ibsen's Fest auf Solhaug, a few choral and instrumental works, an opera in four acts, Der Corregidor, successfully produced at Mannheim in June 1896, and finally settings of three sonnets by Michelangelo in March 1897. In September of this year the malady which had long threatened descended upon him; he was placed in an asylum, released in the following January, only to be immured again some months later by his own wish, after his friend A. von Trarbach had given in his resignation. Four painful years elapsed before his death on the 22nd of February 1903. Apart from his works and the tragedy of his last years there is little in Wolf's life to distinguish it from that of other struggling and unsuccessful musicians. His touchy and difficult temperament perpetually stood in the way of worldly success. What little he obtained was due to the persevering efforts of a small band of friends, critics and singers, to make his songs known, to the support of the Vienna Wagner-Verein, and to the formation in 1895 of the Hugo-Wolf Verein in Berlin. No doubt it was also a good thing for his reputation that the firm of Schott undertook in 1891 the publication of his songs, and that in the first five years amounted to 85 marks 35 pfennigs (about £1. 10s.). He lived in cheap lodgings till in 1896 the generosity of his friends provided him with a house of his own, which he enjoyed for one year.

Among the song composers who have adopted the modern standpoint, according to which accepted canons of beauty and of form must yield if they interfere with a closer or more vivid realization of dramatic or emotional expression, Wolf holds a place in which he has no rival, not because of the daring originality of his methods and the remarkable idiosyncrasies of his style, but because these are the direct outcome of rare poetical insight and imaginative power. He has that gift of vision which makes the difference between genius and talent. His frequent adoption of a type of song built upon a single phrase or leit-motif in the accompaniment has led to the misleading statement that his work represents merely the transference of Wagnerian principles to song. In reality the forms of Wolf's songs vary as widely as those of the poems which he set. No less remarkable is the immense range of style at his command. But with Wolf methods of form and style are so intricately linked with the poetical conceptions which they embody, that they can hardly be considered apart. His place among the greatest song-writers is due to the essential truth and originality of his creations, and to the vivid intensity with which he has presented them. These results depend not merely on musical gifts that are exceptional, but also upon a critical grasp of poetry of the highest order.
No other composer has exhibited so scrupulous a reverence for the poems which he set. To displace an accent was for him as heinous an act of sacrilege as to misinterpret a conception or to ignore an essential suggestion. This fastidiousness of meter has never reached a higher point than in Wolf's songs. Emphasis should also be laid upon the objective and dramatic attitude of his mind. He preferred to make himself the mouthpiece of the poetry rather than to use his art for purposes of self-revelation, avoiding for his songs the works of those whom with healthy scorn he termed the Ich-Poeten. Hence the men and women characterized in his songs are living realities, forming a veritable portrait gallery, of which the figures, though unmistakably the work of a single hand, yet maintain their own separate identity. These statements can be verified as well by a reference to the simpler and more melodious of his songs, as to those which are of extreme elaboration and difficulty. Among the former may be named Das verlassene Magdlein in der Frühe and Der Gärtner (Morike), Verschwiegene Liebe and Der Musikant (Eichendorff), Anacreons Grab (Goethe), Alle gingen, Hera, zur Ruh' and Hera, was fragst (Spanisches Liederbiedern), Nos. 1 and 4 of the Italienisches Liederbuch, and the latter the Aeolsharfe and Der Feuerreiter (Morike), Ganymed and Prometheus (Goethe).

WOLF, JOSEPH (1820-1869), Anglo-German artist, the son of a German farmer, was born in 1820 at Müntzermaifeld, on the river Moselle, in his Rhineland Province. In his boyhood he won an assiduous student of bird and animal life, and showed a remarkable ability as a draughtsman of natural history subjects. His powers were first recognized by Professor Schlegel of the Leiden museum, who gave him employment as an illustrator. In 1848 he settled in London, where he remained till his death on the 20th of April 1869. He made many drawings for the Zoological Society, and a very large number of illustrations for books on natural history and on travel in various countries; but he also won a considerable success as an artist at the Royal Academy, and his Life of Joseph Wolf (London, 1869), WOLF (Canis lupus), the common English name for any wild member of the typical section of the genus Canis (see Carnivora). Excluding some varieties of domestic dogs, wolves are the largest members of the genus, and have a wide geographical range, extending over nearly the whole of Europe and Asia, and North America from Greenland to Mexico, but not are found in South America or Africa, where they are replaced by other members of the family. The present genealogies demonstrate that they are descended from the grey wolf (Canis lupus), which is probably a member of the jackal group, and not a wolf at all. The ordinary colour of the wolf is yellowish or fulvous grey, but almost pure white and entirely black wolves are known. In northern countries the fur is longer and thicker, and the animal generally larger and more powerful than in the southern portion of its range. Its habits are similar everywhere and it is still, and has been from time immemorial, especially known to man in all the countries it inhabits as the devastator of sheep flocks. Wolves do not catch their prey by lying in ambush, or stealing up close and making a sudden spring, but by fairly running it down in open chase, which their speed and remarkable endurance enable them to do. Except during summer when the young families of cubs are being separately provided for by their parents, they assemble in troops or packs, often in relays, and by their combined and persevering efforts are able to overpower and kill deer, antelopes and wounded animals of all sizes. It is singular that such closely allied species as the domestic dog and the wolf, the former a domesticated form of the latter, still maintain their characteristics in the Webcam. The wolf is well known, children and even full-grown people are not infrequently the objects of their attack when pressed by hunger. Notwithstanding the proverbial ferocity of the wolf in a wild state, many instances are recorded of animals taken when quite young becoming tame and attached to the person who has brought them up, when they exhibit many of the ways of a dog.

They can, however, rarely be trusted by strangers.

The history of the wolf in Britain is almost a study in gradual extermination, and has been thoroughly investigated by Mr. J. E. Harington in his work on Extinct British Animals, from which the following account is abridged. To judge by the osteological remains which the researches of the British Museum have now brought to light, there were nearly a county in England or Wales in which, at one time or another, wolves did not abound, while in Scotland and Ireland they must have been still more numerous. The fossil remains which have been discovered in Britain are not larger than, nor in any way to be distinguished from, the corresponding bones and teeth of European wolves of the present day. Wolf-hunting was a favourite pastime of the ancient Britons, as well as of the Anglo-Saxons, in Athelstan's reign these animals abounded to such an extent in Yorkshire that a retreat was built by one Acehorn, at Flixton, near Filey, wherein travellers might seek refuge if attacked by them. As is well known, the Dog Kennel Act (Gent's Chronicle, 16 Sept, 1769) was passed for the preservation of wolves in the country, but, notwithstanding the annual tribute of 300 skins paid to him during several years by the king of Wales, he never acted as the law required. This, however, is a matter of inference from the cessation of all mention of them in local records than from any definite evidence of their extirpation.

The few individuals that remain in any considerable numbers in Scotland, as might be supposed from the nature of the country, the wolf maintained its hold for a much longer period. There is a well-known story of the last of the race being killed by Sir Ewen Cameron of Lochiel in 1686, but there is evidence of wolves having survived in Sutherlandshire and other parts into the following century (perhaps as late as 1743), though the date of their final extinction cannot be accurately fixed. In Ireland, in Cromwell's time, wolves were particularly troublesome. They were increasing in numbers, so that special measures were taken for their destruction, such as the offering of large rewards for their heads, and the burning of their dens. In 1698 a statute was passed for the destruction of the wolves used for hunting the wolves. The active measures taken then and later reduced their numbers greatly, so that towards the end of the century they became scarce, but, as in the case of the Scottish wolf, the date of their final extinction cannot be ascertained. It has been placed, upon the evidence of somewhat doubtful traditions, as late as 1706. According to the best authority the British Islands have been able to clear themselves of these formidable and destructive animals, for France, with no natural barriers to prevent their incursions from the continent to the east, is liable every winter to visits from numbers of these animals.

WOLF-DIETRICH, German hero of romance. The tale of Wolf-dietrich is connected with the Merovingian princes, Theodoric and Theodebert, son and grandson of Clovis; but in the Middle High German poems of Ortin and Wolf-dietrich in the Heldenbuch (q.v.) Wolf-dietrich is the son of Hugdietrich, emperor of Constantinople. Repudiated and exposed by his father, the child was spared by the wolves of the forest, and was educated by the faithful Berchtung of Meran. The account of his parents and their wooing, however, differs in various texts. After the emperor's death Wolf-dietrich was driven from his inheritance by his brothers, and took refuge at the court of King Ortin. He entered the service of Ortin and his sixteen sons stood by Wolf-dietrich. Six of these were slain and the other ten imprisoned. It was only after long exile in Lombardy at the court of King Ortin that the hero returned to deliver the captives and regain his kingdom. Wolf-dietrich's exile and return suggested a parallel with the history of Dietrich of Bern, with whom he was often actually identified; and the Mentors of the two heroes, Hildebrand and Berchtung, are cast in the same mould. Presently features of the
WOLFF, C.—WOLFF, C. F. 773

Wolfdietrich legend were transferred to the Dietrich cycle, and in the Anhang to the Holdenbuch it is stated in despite of all historical considerations that Wolfdietrich was the grandfather of the Veronese hero. Among the exploits of Wolfdietrich was the slaughter of the dragon which had slain Ornitz (n.d.). He thus took the place of Hardheri, one of the mythical Hartung brothers, the original hero of this feat. The myth attached itself to the family of Clovis, around which epic tradition rapidly gathered. Hugdietrich is generally considered to be the epic counterpart of Theodoric (Dietrich), eldest son of Clovis. The prefix was the barbarian equivalent of Frank, and was employed to distinguish him from Theodoric the Goth. After his father’s death he divided the kingdom with his brothers. Wolfdietrich represents his son Theodebert (d. 548), whose succession was disputed by his Hugo, but was secured by the loyalties of the Frankish nobles. But father and son are merged by a process of epic fusion in Wolfdietrich. The rape of Sydrat, daughter of the heathen Walgunt of Salznecke, by Hugdietrich disguised as a woman, is typical of the tales of the wooing of heathen princesses made fashionable by the Crusades, and was probably extraneous to the original legend. It may, however, also be put on a semi-historical basis by adopting the suggestion of C. Voretzsch (Epische Studien I. Die Comp. des Huon von Bordeaux, Halle 1900), that Wolfdietrich is far more closely connected with Theodoric than Theodebert, and that Hugdietrich, therefore, stands for Clovis, the hero in the Merovingian historians, of a well-known Brautfahrtsaga.

Ornitz and Wolfdietrich have been edited by Dr. J. L. Edlen von Lindhausen (Tübingen, 1906). G. Sarrazin, in Zeitschr., für deutsche Philologie, 34, 1906, compared the legend of Wolfdietrich with the history of Gundovald, as given by Gregory of Tours in books vi. and vii. of his Histoire Francorum.

WOLFE, CHARLES (1791–1823), Irish poet, son of Theobald Wolfe of Blackhall, Co. Kildare, was born on the 14th of December 1791. He was educated at English schools and at Trinity College, Dublin, where he matriculated in 1809 and graduated B.A. in 1812. A noble was ordained priest in 1815, and received the curacy of Ballyclog, Co. Tyrone, which he shortly exchanged for that of Donoughmore in the same county. He died at Cork on the 21st of February 1823 in his thirty-second year. Wolfe was well known as a poet in Trinity College circles. He is remembered, however, solely by his stirring stanzas on the “Burial of Sir John Moore,” written in 1816 in the rooms of Samuel O’Sullivan, a college friend, and printed in the Nearty Telegraph.

WOLFE, JAMES (1727–1759), British hero of Quebec, was born at Westham in Kent on the 2nd of January 1727. At an early age he accompanied his father, Colonel (afterwards lieutenant-General) Edward Wolfe, one of Marlborough’s veterans, to the Carthagena expedition, and in 1741 his ardent desire for a military career was gratified by his appointment to an ensigncy. At the age of fifteen he proceeded with the 12th Foot (now Suffolk Regiment) to the Rhine Campaign, and at Dettingen he distinguished himself so much as acting adjutant that he was made lieutenant. In 1744 he received a company in Barrel’s regiment (now the 4th King’s Own). In the Scottish rising of the “Forty-five” he was employed as a brigade-major. He was present at Hawley’s defeat at Falkirk, and at Culloden. With his old regiment, the 12th, Wolfe served in the Flanders campaigns of the duke of Cumberland, and at Val (Lauffeld) won by his valor the commendation of the duke. Promotion followed in 1749 to a majority, and in 1750 to the lieutenant-colonelcy of the 20th, with which he served in Scotland. Some years later he spent six months in Paris. When war broke out afresh in 1757 he served as a staff officer in the unfortunate Rochfort expedition, but his prospects were not affected by the failure, for had his advice been taken the result might well have been different. Next year he was sent to 1 Theodoricus iste dicitur, id est Francus, quia olium omnes Franci Hugonum vocabantur... “Annales Quedinburg.” (Fritz, Script. ii. 420.)

N. America as a brigadier-general in the Louisburg expedition under Amherst and Boscowan. The landing was effected in the face of strenuous opposition, Wolfe leading the foremost troops. On the 27th of July the place surrendered after an obstinate resistance; during the siege Wolfe had charge of a most important section of the attack, and on his lines the fiercest fighting took place. Soon afterwards he returned to England to recruit his shattered health, but on learning that Pitt desired him to continue in America he at once offered to return. It was now that the famous expedition against Quebec was decided upon, Wolfe to be in command, with the local rank of major-general. In a brief holiday before his departure he met at Bath Miss Lowther, to whom he became engaged. Very shortly afterwards he sailed, and on the 1st of June 1759 the Quebec expedition sailed from Louisburg (see Quebec). After weariness and disheartening failures he landed at Louisburg, took possession of it, and crowned his work by the decisive victory on the Plains of Abraham (13th of September 1759) by which the French permanently lost Quebec. Twice wounded earlier in the fight, he had refused to leave the field, and a third bullet passing through his lungs inflicted a mortal injury. While he was lying in a swoon some one near him exclaimed, “They run; see how they run!” “Who run?” demanded Wolfe, as one roused from sleep. “The enemy!” was the answer; “they give way everywhere.” Wolfe rallied for a moment, gave a last order for cutting off the retreat, and expired. “On the road to glory,” wrote Franklin, “he breathed his last. On the battle-ground a tall column bears the words, “Here died Wolfe victorious on the 13th of September 1759.” In the governor’s garden, in Quebec, there is also a monument to the memory of Wolfe and his gallant opponent Montcalm, who survived him only a few hours, with the inscription “Wolfe and Montcalm. Mortem virtus communem, famam historia, monumentum posteritas dedit.” In Westminster Abbey a public memorial to Wolfe was unveiled on the 4th of October 1773.

Parkman, Montcalm and Wolfe (London, 1884); Twelve British Soldiers (London, 1899); General Wolfe’s Instructions to Young Officers (1763–1780); Beckles Willson, The Life and Letters of James Wolfe (1900); and A. G. Bradley, Wolfe (1883).

WOLFENBÜTTEL, a town of Germany, in the duchy of Brunswick, situated on both banks of the Oker, 7 m. S. of Brunswick on the railway to Hanburg. Pop. (1905) 19,038. Lessing was ducal librarian here, and the old library building, designed in 1723 in imitation of the Pantheon at Rome, contains a marble statue of him. The library, including 300,000 printed books and 10,000 MSS., was, however, transferred to a large and new Renaissance edifice in 1857. It is especially rich in Bibles, incunabula and books of the early Reformation period, and contains some of the Gothic bible of Ulflas. Opposite the old library is the palace, now occupied by a seminary. The ducal burial-vault is in the church of St. Mary.

A castle is said to have been founded on the site of Wolfenbüttel by a margrave of Meissen about 1046. When this began in 1267 to be the residence of the early Brunswick or Wolfenbüttel line of counts, a town gradually grew up around it. In 1542 it was taken by the Saxons and Hessians, who, however, evacuated it five years later after the battle of Mühlberg. In the Thirty Years’ War, in June 1641, the Swedes, under Wrangel and Königsmark, defeated the Austrians under the archduke Leopold at Wolfenbüttel, and it was plundered and burnt, after the possession of the Brunswick-Wolfenbüttel family in 1671, and for nearly one hundred years enjoyed the distinction of being the ducal capital. In 1754, however, Duke Charles transferred the ducal residence to Brunswick.

See Voges, Erzählungen aus der Geschichte der Stadt Wolfenbüttel (Wolfenbüttel, 1862); von Heimann, Die historische Bibliothek und die Bibliothek (2nd ed., 1883). For the “Wolfenbüttel fragments” see Lessing and Reimarus.

WOLFF, CASPAR FRIDRICH (1733–1794), German anatomist and physiologist, justly reckoned the founder of modern embryology, was born in 1733 at Berlin, where he studied anatomy and physiology under the elder J. F. Meckel. He
graduated in medicine at Halle in 1759, his thesis being his famous *Theoria generationis*. After serving as a surgeon in the Seven Years' War, he wished to lecture on anatomy and physiology in Berlin, but being refused permission to refer to the empirical material, he became professor of those subjects at the academy of St Petersburg, and acted in this capacity until his death there in 1794.

While the theory of "evolution" in the crude sense—i.e., a simple growth in size and unfolding of organs all previously existing in the germ—was generally overlooked for a time, the fundamental concept of the field of systematic biology was decisively laid by the founder of the science, Wolff. He not only anticipated the modern concept of evolutionary layers, and is said even to have foreshadowed the cell theory.

**WOLFF** (less correctly Wolf), CHRISTIAN (1679-1754), German philosopher and mathematician, the son of a Tanner, was born at Breslau on the 24th of January 1679. At the university of Jena he studied first mathematics and physics, to which he soon added philosophy. In 1703 he qualified as Privadozent in the university of Leipzig, where he lectured till 1705, when he was called as professor of mathematics and natural philosophy to Halle. Before this time he had made the acquaintance of Leibnitz, of whose philosophy his own system is a modification. In Halle Wolff limited himself at first to mathematics, but on the departure of a colleague he added physics, and presently included all the main philosophical disciplines. But the claims which Wolff advanced on behalf of the philosophic reason (see RATIONALISM) appeared impious to his theological colleagues. Halle was the headquarters of Pietism, which, after a long struggle against Lutheran dogmatism, had itself assumed the characteristics of a new orthodoxy. Wolff's professed ideal was to base theological truths on evidence of mathematical certitude, and strife with the Pietists broke out openly in 1721, when Wolff, on the occasion of laying down the office of pro-rector, delivered an oration "On the Practical Philosophy of the Chinese" (Eng. tr. 1730), in which he praised the purity of the moral precepts of Confucius, pointing to them as an evidence of the power of human reason to attain by its own efforts to moral truth. For ten years Wolff was subjected to attack, until in a fit of exasperation he appealed to the court for protection. His enemies, however, gained the ear of the king Frederick the Great, and represented to him that, if Wolff's determinism were recognized, no soldier who deserted could be punished, since he would only have acted as it was necessarily predetermined that he should. This so enraged the king that he at once deprived Wolff of his office, and commanded him to leave Prussian territory within forty-eight hours on pain of a halter. The same day Wolff passed into Saxony, and presently proceeded to Marburg, to which university he had received a call before this crisis. The landgrave of Hesse received him with every mark of distinction, and the circumstances of his expulsion drew universal attention to his philosophy. It was everywhere discussed, and over two hundred books and pamphlets appeared for or against it before 1737, not reckoning the systematic treatises of Wolff and his followers. In 1740 Frederick William, who had already made overtures to Wolff to return, died suddenly, and one of the first acts of his successor, Frederick the Great, was to recall him to Halle. His entry into the town on the 6th of December 1740 partook of the nature of a triumphal procession. In 1743 he became chancellor of the university, and in 1745 he received the title of Freiherr from the elector of Bavaria. But his mind was no longer fresh, he had lost his power of attracting students, and his class-rooms remained empty. He died on the 4th of April 1754.

The Wolffian philosophy held almost undisputed sway in Germany till it was displaced by the Kantian revolution. It is essentially a common-sense adaptation or watering-down of the Lockean system on which it is absolutely hard to advert. In connexion with Leibnitz, Wolff may be said to have methodized and reduced to dogmatic form the thoughts of his great predecessor, which often, however, lost the greater part of their suggestiveness in the process. Since his philosophy disappeared before the influx of new ideas and the appearance of more speculative minds, it has been customary to dwell almost exclusively on its defects—the want of depth or freshness of insight, and the aridity of its neo-scholastic formalism, which tends to relapse into verbose platitudes. But this is to do injustice to Wolff's real merits. These are mainly his comprehensive view of philosophy, as embracing in its survey the whole field of human knowledge, his positive and consistent reasoning, his polemical position, and his confidence in the power of reason to reduce all subjects to this form. To these must be added that he was practically the first to "teach philosophy to speak German." The Wolffian system is the most advanced system in the metaphysics of the period. It is still largely indebted to the modern concept of adaptation of materials, and the doctrine of monism recces into the background, the monads falling asunder into souls or conscious beings on the one hand and mere atoms on the other. But the doctrine of the possible and the impossibility of the science of the possible, and divided, according to the two faculties of the human individual, into a theoretical and a practical part. Logic, sometimes called *philosophia rationalis*, forms the introduction or prelude to both. Theoretical philosophy (i.e., parts ontology or *philosophia prima*, cosmology, rational psychology and natural theology; ontology treats of the existent in general, psychology of the soul as a simple non-extended substance, cosmology of the world as a whole, and rational theology of the existence and attributes of God. These are best known to philosophical students by Kant's treatment of them in the *Critique of Pure Reason*. In the third period, he enters into economics and politics. Wolff's moral principle is the realization of human perfection.

The most important works are as follows: Anfangsgründe aller mathematischen Wissenschaften (1710; in Latin, *Elementa matheos universae*, 1713-1715); Versucht Nachweis von den Köpfen des menschlichen Verstandes (1712; Eng. trans. 1770); Vern. Ged. von dem Theil in den Menf und die Kurfürsten in Hessen; Philosophia rationalis, sive logica (1728); Philosophia prima, sive Ontologia (1729); Cosmologia generalis (1731); Psychologia empirica (1732); Psychologia rationalis (1734); Theologia naturalis (1736-1737); Philosophia practica universalis (1738-1739); Philosophia moralis (1750-1753). His *Kleine philosophische Schriften* have been collected and edited by G. F. Hagen (1736-1740). In addition to Wolff's autobiography (*Eigene Lebensbeschreibung*; ed. H. Wurtte, 1841) and the usual histories of philosophy, see W. Schrader in *Allgemeine deutsche Biographie*, xiv.; C. G. Ludovic, *Ausführlicher Entwurf einer vollständigen Geschichte der Philosophie*, 1830; E. W. Ticken, *Wolff's Philosophie*, 1831; J. V. Knecht, *Wolff's Verhältnis zu Leibniz* (1857). (A. S. P.-F.; X.)

**WOLFF, JOSEPH** (1795-1862), Jewish Christian missionary, was born at Wellersbach, near Bamberg, Germany, in 1795. His father became rabbi at Württemberg in 1806, and sent his son to the Protestant lyceum at Stuttgart. He was converted to Christianity through reading the books of Johann Michael von Sailer, bishop of Regensburg, and was baptized in 1826 by the Benedictine abbott of Emaus, near Prague. Wolff was a keen Oriental scholar and pursued his studies at Tübingen and at Rome, where he was expelled from the Collegio di Propaganda in 1818 for attacking the doctrine of infallibility and criticizing his tutors. After a short stay in the monastery of the Redemptorists at Val Sainte near Fribourg, he went to London, entered the Anglican Church, and resumed his Oriental and theological studies at Cambridge. In 1821 he began his missionary wanderings in the East by visiting Egypt, the Sinaitic peninsula, Jerusalem, Aleppo, Mesopotamia, Persia, Tibet, and Turkestan. In 1826, when Edward Irving introduced him to Lady Georgina Walpole, 6th daughter of Horatio Walpole, earl of Orford, whom he married in February 1827. In 1828 Wolff set out to search for the ten tribes, travelling through Anatolia, Armenia, Turkestan and Afghanistan to Simla and Calcutta, suffering many hardships but preaching with enthusiasm. He visited Madras, Pondicherry, Goa and Bombay, travelling home by Egypt and Malta. In 1826 he found Samuel Gobat in Abyssinia, took him to Jiddah, and himself visited Yemen and Bombay, going on to the United States, where he was ordained deacon in 1837, and priest in 1838.
In the same year he was given the rectory of Lintwhaite in Yorkshire. In 1843 he went to Bokhara to seek two British officers, Lieut.-Colonel C. Stoddart and Captain A. Conolly, and narrowly escaped the death that had overtaken them. In 1844 he published a translation of the ‘Narrative of an Account of a Journey into the Interior of Asia’ through a district of Central Asia, between 1838 and 1832. In 1845 he was presented to the vicarage of Isle Brewers, Somerset, and was planning another great missionary tour when he died on the 2nd of May 1862.

His son, Sir Henry Drummond Wolff (1830–1908), was a well-known English diplomatist and Conservative politician, who started as a clerk in the foreign office and was appointed K.C.M.G. in 1862 for various services abroad. In 1874–1880 he sat in parliament for Christchurch, and in 1880–1885 for Portsmouth, being one of the group known as the “Fourth Party.” In 1885 he went on a special mission to Constantinople in connection with the Egyptian question, and as the result various awkward difficulties, hanging on the sultan’s suzerainty, were got over. In 1888 he was sent as minister to Teheran, and from 1892 to 1900 was ambassador at Madrid. He died on the 11th of October 1908. Sir Henry was a notable raconteur, and he did good service to the Conservative party by helping to found the Primrose League. He was created G.C.M.G. in 1878 and G.C.B. in 1889.

WOLFRAMITE, or Wolfram, a mineral consisting of iron-manganese tungstate, (Fe, Mn)WO₄. The name is of doubtful origin, but it has been assumed that it is derived from the German Wolf and Rahm (fortith), corresponding with the spuma lupi of old writers, a term hardly appropriate, however, to the mineral in question. Wolframite crystallizes in the monoclinic system, with an approach to an orthorhombic type; and the crystals offer perfect pinacoidal cleavage. The colour of wolframite is generally brownish, and it is lustre adamantine. The hardness is 5 to 5.5, and the specific gravity 7.1 to 7.5. Wolframite may be regarded as an isomorphic mixture, in variable ratio, of iron and manganese tungstates, sometimes with a small proportion of niobic and tantalic acids. It was in wolframite that the metal tungsten was first recognized in 1785 by two brothers, J. J. and F. d’Elhuyar. At the present time the mineral is used in the manufacture of tungsten-steel and in the preparation of certain tungstates.

It is commonly associated with tin-ores, as in many parts of Cornwall, Saxony and Bohemia. In consequence of the two minerals, cassiterite and wolframite, having nearly the same density, their separation becomes difficult by the ordinary processes of ore-dressing, but may be effected by magnetic methods, since wolframite being attracted by powerful magnets. A process introduced many years ago by R. Oxland consisted in roasting the mixed ore, which was then converted into sodium tungstate, which was easily removed as a soluble salt. Wolframite occurs at many localities in the United States, notably at Trumbull, Conn., where it has been mined, and at Monroe, Conn., where it accompanies bismuth ores. Other localities are in Mecklenburg county, N.C., and in the Mammoth mining district, Nevada. Wolframite has in some cases resulted from the alteration of scheelite (g.), though on the contrary pseudomorphs are known in which scheelite has taken the form of wolframite. By oxidation wolframite may become encrusted with tungstic oreh, or tungstite, sometimes known as wolframine, a name to be carefully distinguished from wolframine.

As the relative proportions of iron and manganese vary in wolframite, the composition tends towards that of other minerals. Thus there is a manganese tungstate (MnWO₄) known as hübnerite, a name given by E. N. Riotte, in 1865, in compliment to Adolph Hübner, a Saxon mineralogist. There is also a mineral which contains little more than ferrous tungstate (FeWO₄), and is known as ferberite, named by Mme. Bismuth in 1863 after Rudolph Ferber. The original hübnerite came from the Mammoth district, Nevada, and the ferberite from the Sierra Almagrera in Spain. It is possible that such minerals may represent the extreme terms in the series formed by the varieties of wolframite.

WOLFRAM VON ESCHENBACH, the most important and individual poet of medieval Germany, flourished during the end of the 12th and beginning of the 13th century. He was one of the brilliant group of Minnesingers whom the Landgrave Herrmann of Thuringia gathered round him at the historic castle of the Wartburg. We know by his own statement that he was a Bavarian, and came of a knightly race, counting his achievements with spear and shield far above his poetical gifts. The Eschenbach from which he derived his name was most probably Ober-Eschenbach, not far from Pleinfeld and Nuremberg; there is no doubt that this was the place of his burial, and so late as the 17th century his tomb was to be seen in the church of Ober-Eschenbach, which was then the burial place of the Teutonic knights. Wolfram probably belonged to the small nobility, for he alludes to men of importance, such as the counts of Abenberg, and of Wertheim, as if he had been in their service. Certainly he was a poor man, for he makes frequent and jesting allusions to his poverty. Bartsch concludes that he was a young son, and that while the family seat was at Eschenbach, Wolfram’s home was the insignificant estate of Wildenburg (to which he alludes), now the village of Wehlenberg. Wolfram seems to have disdained all literary accomplishments, and in fact insists on his unlettered condition both in Parzival and in Willehalm. But this is somewhat perplexing, for these poems are beyond all doubt renderings of French originals. Were the poems read to him, and did he dictate his translation to a scribe? The date of Wolfram’s death is uncertain. We know that he was alive in 1216, as in Willehalm he laments the death of the Landgrave Herrmann, which took place in that year, but how long he survived is unknown. His works appear to have been written almost entirely in German.

Wolfram von Eschenbach lives in, and is revealed by, his work, which shows him to have been a man of remarkable force and personality. He has left two long epic poems, Parzival and Willehalm (the latter a translation of the French chanson de geste Atis- cans), certain fragments, Tatitur (apparently intended as an introduction to the Parzival), and a group of lyrical poems, Wächter-Lieder. These last derive their name from the fact that they record the feelings of lovers who, having passed the night in each other’s company, are called to separate by the call of the watch-dog. Parzival, or Wächter-Lieder, are a feature of Old German folk-poetry, of which Wagner has preserved the tradition in the warning cry of Brangäene in the second act of Tristan. But the principal interest of Wolfram’s work lies in his Parzival, immeasurably the finest and most spiritual rendering of the Perceval-Grail story.

The problem of the source of the Parzival is the crux of medieval literary criticism (see PERCEVAL). These are the leading points. The poem is divided into sixteen books. From iii. to xii., inclusive, the story moves pari passu with the Perceval of Chrétien de Troyes, and is often expressed in the French text, at the next introducing details quite unknown to it. Books i. and ii., unrepresented in Chrétien, relate the fortunes of the hero’s father, and connect the story closely with the house of Anjou; the four concluding books agree with the commencement, and further connect the Grail story with that of the Swan Knight, for the first time identifying that hero with Parzival’s son, a version followed by the later German romance of Lohengrin. At the conclusion Wolfram definitely blames Chrétien for having mistold the tale, while a certain Klot the Provencal (whom he has before named as his source), and the French text, at the same time, disclaimed the authorship of the Grail, an allusion, they say, to the authorship of Der Hohelied. Instead of an asceticism, based upon a fundamentally low and degrading view of women, Wolfram upholds a sane and healthy morality; chastity, rather than celibacy, is his ideal, and a loyal observance of the marriage bond is in his eyes the highest virtue. Not retirement from the world, but fulfilment of duty in the world,
WOLGAST—WOLLASTONITE

is the goal he marks out for attainment. Whether views so large, so sane and so wholesome are to be placed to the credit of the German poets, or of his French source (and modern criticism is leaning more and more to a belief in the existence of Kiot), the Parsial is the work of a remarkable personality, and, given the age and the environment, a unique literary achievement.

Wolfram has moments of the highest poetical inspiration, but his meaning, even for his compatriots, is often obscure. He is in no sense a master of language, as was Gottfried von Strassbourg. This latter, in a very interesting passage of the Tristion, passes in review the poets of the day, awarding to the majority praise for the excellence of their style, but one he does not mention, this being too obscure and involved, that none can tell what his meaning may be; this un-named poet has always been understood to be Wolfram von Eschenbach, and in a passage of Wilhelm the author refers to the unfavourable criticisms passed on Parsial. Wolfram and Gottfried were both true poets, but of widely differing style. Wolfram was, above all, a man of deeply religious character (witness his introduction to Willehalm), and it seems he has been this which specially impressed the mind of his compatriots; in the 13th-century poem of Der Wartburg-Krieg it is Wolfram who is chosen to represent the attributes of Christianity, to be the enchanter Klinglor von Ungerland. (J. L. W.)

WOLGAST, a seaport town of Germany, in the Prussian province of Pomerania, situated on the river Peene, which separates it from the island of Usedom, 30 m. by rail E. of Greifswald. Pop. (1905) 8346. There are various manufactures. Wolgast became a town in 1247, and after being the residence of the duke of Pomerania-Wolgast, it was ceded to Sweden in 1648. It was captured four times during the Thirty Years' War, and in 1675 by Frederick William, elector of Brandenburg. It was restored to Germany in 1715.

See B. Heberlein, Beitrage zur Geschichte der Burg und Stadt Wolgast (Wolgast, 1892).

WOLLASTON, William (1659-1724), English philosophical writer, was born at Coton-Clanford in Staffordshire, on the 26th of March 1659. On leaving Sidney Sussex College, Cambridge, in 1671, he became an assistant master at the Birmingham grammar school, and took holy orders. In 1688 an uncle left him a fortune. He then moved to London, married a lady of wealth, and devoted himself to learning and philosophy. He embodied his views in the one book by which he is remembered, The Religion of Nature Demonstrated (1st ed. 1722; 2nd ed. 1724). He died in October 1724.

Wollaston's Religion of Nature, which falls between Clarke's Discourse of the Unchangeable Obligations of Natural Religion and Butler's Sermons, was one of the most popular philosophical books of its day. To the 8th edition (1762) was added a life of the author. The book was designed to be an answer to two questions: Is there such a thing as natural religion? and, if there is, what is it? Wollaston starts with the assumption that religion and morality are identical, and labours to show that religion is "the pursuit of happiness by the practice of truth and reason." He claims originality for his theory that the moral evil is the practical denial of a true proposition and moral good the affirmation of it (see Ethics). Wollaston also published anonymously a small book, On the Design of the Book of Ecclesiastes, or the Unreasonableness of Men's Restless Contention for the Present Enjoyments, represented in an English Poem (London, 1691). See John Clarke, Examination of the Notion of Moral Good and Evil advanced in a late book entitled The Religion of Nature Demonstrated (London, 1725); Drechler, Uber Wollastons Moral-Philosophie (Erlangen, 1802); Sir Leslie Stephen's History of English Thought in the Eighteenth Century (London, 1876), ch. iii. and ch. ix.; H. Sidgwick's History of Ethics (1902), pp. 198 sq.

WOLLASTON, William Hyde (1766-1828), English chemist and natural philosopher, was born at East Dereham, Norfolk, on 24th April 1766, the seventh child. His father, the Rev. Francis Wollaston (1731-1815), rector of Chislehurst, and afterwards at Camberwell, Cambridge, of which he became a fellow. He took the degrees of M.B. (1787) and M.D. (1793), starting to practise medicine in 1790 at Bury St Edmunds, whence he soon removed to London. But he made little way, and failed to obtain a vacant physicianship at St George's hospital; the result was that he abandoned medicine and took up natural philosophy. Wollaston's researches in the domain of the elements of the Royal Society, of which he was elected a fellow in 1793 and made secretary in 1806. He was elected interim president in June 1820, on the death of Sir Joseph Banks; but he did not care to enter into competition with Sir Humphry Davy, and the latter was elected president at the anniversary meeting in November 1820. Wollaston became a member of the Geological Society of London in 1812, and served frequently on the Council and for some time as a vice-president. Beyond appearing at the meetings of learned societies he took little part in public affairs; indeed, he spent much of his time in pursuing studies in a deliberate and exhaustive manner, but in the most rigid manner. Wollaston was admitted to his laboratory on any pretext. Towards the close of 1828 he felt the approach of a fatal malady—a tumour in the brain—and devoted his last days to a careful revision of his unpublished researches and industrial processes, dictating several papers on these subjects, which were afterwards published in the Philosophical Transactions. He died in London on the 22nd of December 1828.

Wollaston's original work deals more or less directly with chemical subjects, but diverges on all sides into optics, acoustics, mineralogy, astronomy, physiology, botany and even art. In chenistry he made a speciality of the platinum metals. Platinum was discovered by Wollaston in 1778, and as early as 1775 he had found a way of making a fortune from the secret, which, however, he disclosed in a posthumous paper (1829); and he was the first to detect the metals palladium (1804) and rhodium (1805) in crude platinum. In regard to paladium this conduct was tenor in character. He anonymously offered a quantity of the metal for sale at an instrument-maker's shop, issuing an advertisement in which some of its properties were stated. A chemist, having bought some of the substance, decided after experiment that it was not a simple body as claimed, but an alloy of mercury with platinum, and in 1803 presented a paper to the Royal Society of London for the improvement of natural knowledge. In 1803, Wollaston was elected a member of the Geological Society, and in 1820 he was appointed to the chair of mineralogy, to which he gave up the chair of mineralogy, to which he gave up his last days. He was the first to make the discovery of rhodium. In 1809 he proved the elementary character of columbium (niobium) and titanium. In optics he was the first, in 1802, to observe the dark lines in the solar spectrum. Of the seven lines he saw, he regarded the five most to the right of the sun as the first, which he supposed were the simple colours of the prismatic spectrum, which he supposed to have four primary divisions. He described the reflecting goniometer and the camera lucida, provided microscopes with the "Wollaston double," and applied concavo-convex lenses to the purposes of the oculist. His clystraphos was described in 1813, in a paper "On a method of freezing at a distance." In 1821, after a long train of experiments, Wollaston secured a "thing" to deflect an electric current, he attempted, in the laboratory of the Royal Institution, the discovery of nitrogen, by which Faraday did not admit his claim. Among his other papers may be mentioned those dealing with the formation of fairy rings (1807), a synoptic scale of chemical equivalents (1814), sounds in the air, the "aurora" and the magnetic needle (1815), a supposed disjunct of the eyes in a portrait (1824) and the comparison of the light of the sun with that of the moon and fixed stars (1825).

In geological circles Wollaston is famous for the medal which he bestowed, and which (together with a donation fund) is annually awarded by the council of the Geological Society of London, being the result of the interest of £1000 bequeathed by Wollaston for the promoting researches in the minor sciences. The first award was made in 1831. The medal is the highest honour bestowed by the society: it was originally made of palladium, but is now made of gold.

A commemorative essay on Wollaston will be found in George Wilson's Religiou Chem, 1862.)

WOLLASTONITE, a rock-forming mineral consisting of calcium metasilicate, CaSiO₃, crystallizing in the monoclinic system and belonging to the pyroxene (攀) group. It differs, however, from other members of this group in having cleavages, not parallel to the prism-faces, but in two directions perpendicular to the
plane of symmetry. Crystals are usually elongated parallel to the axis of symmetry and flattened parallel to the ortho-pinoacoid, hence the early name “tabular spar”; the name wollastonite is after W. H. Wollaston. The mineral usually occurs in white cleavage masses. The hardness is 5, and the specific gravity 2.85. It is a characteristic product of contact-metamorphism occurring especially, with garnet, diorite and gabbro, in crystalline limestones. Crystals are found in the cavities of the ejected limestone blocks of Monte Somma, Vesuvius. At Santa Fè in the State of Chiapas, Mexico, a large rock-mass of wollastonite carries ores of gold and copper: here are found large pink crystals which are often partially or wholly altered to opal. (L. J. S.)

WOLLIN, an island of Germany, in the Prussian province of Pomerania, the more easterly of the islands at the mouth of the Oder which separate the Stettiner Haff from the Baltic Sea. It is divided from the mainland on the E. by the Dievenow Channel, and from Usedom on the W. by the Swine. It is roughly triangular in shape, and has an area of 95 sq. m. Heath and sand alternate with swamps, lakes and forest on its surface, which is flat, except towards the south-west, where the low hills of Lebbin rise. Cattle-rearing and fishing are the chief resources of the inhabitants, who number about 14,000. Misdroy, on the N.W. coast, is a favourite sea-bathing resort, and some of the other villages, as Ostsowine, opposite Swinemünde, Pritter, famous for its eels, and Lebbin, are also visited in summer. Wollin, the only town, is situated on the Dievenow, and is connected with the mainland by three bridges. It carries on the industries of a small seaport and fishery. Pop. (1900) 4,184.

Near the modern town once stood the ancient and opulent Wendish city of Wolin or Junme, called Julin by the Danes, and Winetha or Vineta (i.e. Wendish town) by the Germans. In the 10th and 11th centuries it was the centre of an active and extensive trade. Adam of Bremen (d. 1076) extols its size and wealth, and mentions that Greeks and other foreigners frequented it, and that Saxons were permitted to settle there on equal terms with the Wends, so long as they did not obstruct the fact of their Christianity. The Northmen made a settlement here about 970, and built a fortress on the "silver hill," called Jomsborg, which is often mentioned in the sagas. Its foundation was attributed to a legendary Viking exiled from Denmark, called Paltokote or Palnatoki. The stronghold of Jomsburg was destroyed in 1098 by King Magnus Barford of Norway. This is probably the origin of the legend that Vineta was overthrown by a storm or earthquake and overwhelmed by the sea. Some submarine granitic rocks near Damerow in Usedom are still popularly regarded as its ruins. The town of Wolin became in 1140 the seat of the Pomeranian bishopric, which was transferred to Kammin about 1170. Wolin was captured by Canute VI. of Denmark in 1183, and was taken by the Swedes in 1630 and 1759, and by the Brandenburgs in 1659 and 1765.

See Khull, *Die Geschichte Palnatskis und der Jomsburger* (Graz, 1892); Koch, *Vineta in Prosa und Poesie* (Stettin, 1905); W. von Raumer, *Die Insel Wolin* (Berlin, 1851); Haas, *Sagen und Erzählungen von den Inseln Usedom und Wolin* (Stettin, 1904).

WOLLONGONG, a seaport of Camden county, New South Wales, Australia, 49 m. by rail S. of Sydney, the third port and chief harbour on the S. coast of the colony. Pop. (1901) 3,545. Its harbour, known as Belmont Basin, is excavated out of the rock 35 ft. below the surface, at low water. A breakwater protects its mouth; it has a lighthouse, and is defended by a fort on Signal Hill. It is the port for the Osborne-Wollong and Mount Pleasant collieries, which are connected with it by rail. It lies at the foot of Mount Keira, amid fine mountain and coast scenery.

WOLFF (Wolof, Jolof), a Negroid people of Senegal, French West Africa. They occupy the seaboard between St. Louis and Cape Verde and the south bank of the Senegal from its mouth to Dagana. Farther inland the districts of the Walo, Cayor Bay, and Jolof (the last, the name of a chief division of the nation, being sometimes used as the national name) are almost exclusively peopled by Wolof. The cities of St. Louis and Dakar are both in the Wolof country, and throughout the French Sudan no military station is without a Wolof colony, preserving national speech and usages. The name is variously explained as meaning "speaker" or "black." The Wolof justify both meanings, for they are at once the blackest and among the most garrulous of all African peoples. They are a very tall race, with relatively pointed heads, elongated legs and flat feet.

The Wolof language is spoken throughout Senegambia, and numerous grammars, dictionaries and vocabularies have appeared since 1825. There is, however, no written literature. The Wolof preserve their national songs, legends and proverbs by memoralit, but have little knowledge of letters beyond the Arabic characters on their paper spells and amulets. Wolof, a typical agglutinating language, differs from all other African forms of speech. The roots, along with all monosyllabic ending in consonants, are determined by means of suffixes, and coalesce while remaining invariable in their meanings. By these suffixes the meaning of the words is endlessly modified.

Most Wolof are nominally Mahommedans, and some near the Christian missions profess Christianity, but many pagan rites are still observed. Animal worship is prevalent. The capture of a shark is hailed with delight, and family genei have offerings made to them, the most popular of these household deities, the lizard, having in many houses a bowl of milk set aside for it daily. The Wolof have three hereditary castes, the nobles, the tradesmen and musicians (who are despised), and the slaves. These latter are kindly treated.

Wolfuss, Johann Peter (1768-1824), German publisher, was born at Munich. He settled at Breslau and took part in the revolution of 1830. Sent to Paris as secretary to the legation by the provisional government, he settled there on the suppression of the Polish rebellion and was naturalized in 1834. In 1833 he founded the *Revue de législation et de jurisprudence*, and wrote voluminously on economic and financial subjects. He established the first Crédit Foncier in France in 1852, and in 1864 became professor of political economy at the Conservatoire in succession to J. A. Blanqui. He was a member of the national assembly from 1848 to 1851, and again from 1871 till his election as a senator in 1876. He was a strong free-trader and an ardent bimetallist.

Of his works the following are the more important: *Mobilisation du crédit foncier* (1839); *De l'organisation industrielle de la France avant Colbert* (1842); *Les Finances de la Russie* (1846); *La Question des banques* (1846); *La Liberté commerciale* (1869); *L'Or et l'argent* (1870).

WOLSELEY, Garnet Joseph Wolseley, 1st Viscount Wolseley (1833-1913), British soldier, was born in 1833. Educated at Dublin, he obtained a commission as ensign in the 12th Foot in March 1852, and was transferred to the 8th Foot, with which he served in the second Burmese War. He was severely wounded on the 19th of March 1853 in the attack of Donabury, was mentioned in despatches, and received the war medal. Promoted to be lieutenant and invalided home, he exchanged into the 90th Light Infantry, then in Dublin. He accompanied the regiment to the Crimea, and landed at Balaklava in December 1854. He was selected to be an assistant engineer, and did duty with the Royal Engineers in the trenches before Sebastopol. He was promoted to be captain in January 1855, after less than three years' service, and served throughout the siege, was wounded at the Quarries on the 7th of June, and again in the trenches on the 30th of August. After the fall of Sebastopol Wolseley was employed on the quartermaster-general's staff, assisted in the embarkation of the troops and stores, and was one of the last to leave the Crimea in July 1856. For his services he was twice mentioned in despatches, and was raised to the rank of major, received the war medal with clasps, the 5th class of the French Legion of Honour, the 5th class of the Turkish Mejidieh and the Turkish medal. After six months' duty with the 90th
Foot at Aldershot, he went with it again, in March 1857, to join the expedition to China under Major-General the Hon. T. Ashburnham. Wolseley embarked in command of three companies in the transport 'Transvaal,' which was wrecked in the Strait of Bashi. The troops were all saved, but with only their arms and a few rounds of ammunition, and were taken to Singapore, whence, on account of the Indian Mutiny, they were despatched with all haste to Calcutta. Wolseley distinguished himself at the relief of Lucknow under Sir Colin Campbell in November, and in the defence of the Alambagh position under Outram, taking part in the actions of the 22nd of December 1857, the 12th and 16th of January 1858, and the repulse of the grand attack of the 21st of February. In March he served at the final siege and capture of Lucknow. He was then appointed deputy-assistant quartermaster-general on the staff of Sir Hope Grant's Oudh division, and was engaged in all the operations of the campaign, including the actions of Bari, Sarsi, Nawabganj, the capture of Faizabad, the passage of the Gumti and the action of Sultanpur. In the autumn and winter of 1858 he took part in the Baiswara, trans-Gogra and trans-Rapti campaigns, ending with the complete suppression of the rebellion. For his services he was frequently mentioned in despatches, and, having received his Crimean majority in March 1858, was in April 1859 promoted to be lieutenant-colonel, and received the Mutiny medal and clasp.

Wolseley continued to serve on Sir Hope Grant's staff, and when Grant was nominated to the command of the British troops in the Anglo-French expedition to China in 1860, accompanied him as deputy-assistant quartermaster-general. He was present at the action at Sin-bo, the capture of Tang-ku, the storming of the Taku Forts, the occupation of Tientsin, the battle of Pa-le-cheau and the entry into Peking. He assisted in the re-embarkation of the troops before the winter set in. He was mentioned in despatches, and for his services received the medal and two clasps. On his return home he published the Narrative of the Anglo-Chinese War, 1857-1860.

In November 1861 Wolseley was one of the special service officers sent to Canada to make arrangements for the reception of troops in case of war with the United States in connexion with the mail steamer "Trent" incident, and when the matter was amicably settled he remained on the headquarters staff in Canada as assistant quartermaster-general. In 1865 he became a brevet colonel, was actively employed the following year in connexion with the Fenian raids from the United States, and in 1867 was appointed deputy-quartermaster-general in Canada. In 1869 his Soldier's Pocket Book for Field Service was published, and the work went through many editions. In 1870 he successfully commanded the Red River expedition to put down a rising under Louis Riel at Fort Garry, now the city of Winnipeg, the capital of Manitoba, then an outpost in the Wilderness, which could only be reached through a network of rivers and lakes extending for 600 m. from Lake Superior, traversed only by Indians, and where no supplies were obtainable. The admirable arrangements made and the careful organization of the transport reflected great credit on the commander, who on his return home was made K.C.M.G. and C.B.

Appointed assistant adjutant-general at the war office in 1871 he worked hard in furthering the Cardwell schemes of army reform, was a member of the local committee, and a keen advocate of short service, territorial regiments and linked battalions. From this time till he became commander-in-chief Wolseley was the prime mover and the deciding influence in practically all the steps taken at the war office for promoting the efficiency of the army under the altered conditions of the day. In 1873 he commanded the expedition to Ashanti, and, having made all his arrangements at the Gold Coast before the arrival of the white troops in January 1874, was able to complete the campaign in two months, and re-embark them for home before the unhealthy season began. This was the campaign which made his name a household word in England. He fought the battle of Amofu on the 31st of January, and, after five days' fighting, ending with the battle of Orohatsu, entered Kumasi, which he burned. He received the thanks of both Houses of Parliament and a grant of £25,000, was promoted to be major-general for distinguished service in the field, received the medal and clasp and was made G.C.M.G. and K.C.B. The freedom of the city of London was conferred upon him with a sword of honour, and he was made master of the D.C.L. of Oxford and LL.D. of Cambridge universities. On his return home he was appointed inspector-general of auxiliary forces, but had not held the post for a year when, in consequence of the native unrest in Natal, he was sent to that colony as governor and general commanding.

In November 1876 he accepted a seat on the council of India, from which in 1878, having been promoted lieutenant-general, he went as high-commissioner to the newly acquired possession of Cyprus, and in the following year to South Africa to supersede Lord Chelmsford in command of the forces in the Zulu War, and as governor of Natal and of the Transvaal and high commissioner of South-East Africa. But on his arrival at Durban in July he found that the war in Zululand was practically over, and after effecting a temporary settlement he went to the Transvaal. Having reorganized the administration there and reduced the powerful chief Sikukuni to submission, he returned home in May 1880 and was appointed quartermaster-general to the forces. For his services in South Africa he received the Zulu medal with clasp, and was made G.C.B.
